CA-SLA has developed a view of language learning as a situated social practice: Learning is seen as embedded in the moment-by-moment deployment of (most typically) interactionally organized courses of practical activities, such as telling a story, negotiating an understanding, solving a task, and so forth. As Markee and Kasper (2004) put it: "learning behaviors may usefully be understood as a conversational process that observably occurs in the intersubjective space between participants, not just in the mind/brain of individuals" (p. 496). CA-SLA views learning processes as contingent upon (and observable within) the micro-details of social interaction, and as socially distributed. This conception rests on an understanding of social interaction as the bedrock of human linguistic and (more generally social and mental) functioning (see Garfinkel, 1967; Schegloff, 1991) and hence as the starting point of the study of SLA.

Accordingly, learning behaviors are understood to be basically adaptive behaviors: Rather than resulting from static previous knowledge or stable individual traits, they are situated conducts, depending on the way learners orient to and interpret the situation at hand through the course of its accomplishment and how they respond to the local contingencies

of social practice. As learning behaviors are situated, so are the resulting competencies: They are co-constructed, adaptive, flexible, and sensitive to the contingencies of use. These conceptions have been captured in CA-SLA research by the notions of *learning-in-action* (Firth & Wagner, 2007) and *competence-in-action* (Pekarek Doehler, 2006). They can be interpreted as offering a renewed grasp on a core issue of traditional SLA, namely variability: What classically has been termed the learner's "interlanguage" is seen as eminently sensitive to the contingencies of communicative practice.

In recent work, the very object of L2 learning has been cast in terms of "methods" (in the ethnomethodological sense of the term) for accomplishing second language (L2) talk-in-interaction (Mondada & Pekarek Doehler, 2004; Hellermann, 2008; Pekarek Doehler, 2010). Methods are systematic procedures (of turn taking, repairing, opening or closing conversations, etc.) by which members organize their conduct in ordered and mutually recognizable ways. Methods are part of the competence that allows members to participate in social interactions (see Garfinkel, 1967). They are hence the very object of developing the ability to interact in a (second) language. This conception clearly broadens the view of the object of learning beyond the details of the linguistic system and addresses issues of L2 interactional competence. It also respecifies the notion of language as a dynamic, adaptive resource for action (Firth & Wagner, 2007; Pekarek Doehler, 2010). This shifts the researcher's focus away from concerns with the correctness of linguistic forms toward an interest in how patterns of language use serve to accomplish social interactions and how they emerge from these interactions.

On the Observability of Sociocognitive Processes

The CA-SLA notion of learning is rooted in an understanding of cognition as inextricably intertwined with (inter)action (see Schegloff, 1991). Sociocognitive learning processes are embedded in what Schegloff (1992, p. 1338) calls the "procedural infrastructure" of social interaction (see Kasper, 2009): A turn at talk projects (i.e. makes conditionally relevant) specific types of next actions and the next turn displays an understanding of the previous one. The sequential organization of talk hence informs us about how participants orient toward each other, toward language, and toward processes of language learning. As Garfinkel (1967) proposed in his foundational work in ethnomethodology, the relation between cognition and social organization is observable and accountable as materialized in the micro-details of social conduct.

While CA-SLA cannot tell us what happens in the brain of the learner, its analytic apparatus enables it to uncover how learning processes are observably shaped within the moment-by-moment unfolding of everyday communicative practices and the social agents' local interpretive processes (see Firth & Wagner, 1997, 2007; Kasper, 2009; Seedhouse, 2004). Factors that have been widely acknowledged within the larger field of SLA as key determinants of learning, such as motivation, learning strategies, attention focus, and noticing, have been shown in CA-SLA research to be configured in response to social practices, to be observably enacted within the turn-by-turn unfolding of such practices (for examples see Kasper, 2009; Markee & Seo, 2009; Pekarek Doehler, 2010) and embodied through gesture, body movements, and the use of tools such as paper and pencil (Mori & Hasegawa, 2009). A major contribution of CA-SLA studies to understanding the process of learning lies in documenting how interaction shapes cognition and how learning processes are configured within situated courses of practical activities.

Methodological Underpinnings

CA-SLA studies share a range of basic CA methodological principles:

- *Naturally occurring data*, audio or video recorded and finely transcribed, provides the basis for analysis.
- *Activity* rather than language form is the starting point for analysis: The focus is primarily on how learners do things (how they do repair, take a turn, open a story, or close a conversation), and how they use and elaborate language to do so.
- Typically, *collections* of such doings are established in order to identify recurrent “methods” for accomplishing social actions and recurrent interactional formats that provide opportunities for learning.
- *An emic perspective* is brought to bear on the data: Analysis attempts to uncover how participants themselves orient to and interpret each other’s actions, how they treat each other as learner or expert, and how they orient toward learning or competence. Sequential analysis is the prime methodological tool for warranting an emic perspective (see Schegloff, 1991).
- *Systematic sequential analysis* is undertaken in order to uncover the micro-details of the moment-by-moment unfolding of talk-in-interaction.

Given the relatively short history of CA-SLA, there remain many individual differences between the studies currently undertaken. One of the most notable among these is the degree of attachment to the analytic mentality of CA and the need to supplement that source of inspiration by other theories (for a recent discussion see Kasper, 2009). Also, there are a range of socially oriented SLA studies (not subsumed under the notion of CA-SLA) that use CA as a technical tool for microanalysis without implementing CA’s analytic mentality.

Analyzing L2 Interactions and Learning Environments

Looking back on less than two decades of CA-SLA research, we can distinguish roughly speaking two phases. Much of the earlier work undertaken on L2 interaction was concerned with understanding L2 interactions. It was in part designed as a counter-position to the dominant cognitive orientation of SLA research, and motivated by the idea that for understanding SLA, we need first to understand the details of L2 use. An early development in this direction, rarely noted in the Anglo-Saxon literature, was offered by CA-inspired Francophone studies on interaction and SLA (e.g. de Pietro, Matthey, & Py, 1989; Krafft & Dausendschön-Gay, 1993). Starting in the late 1980s, these studies provided valid insights into the role of interactional formats as a potential basis of learning, as well as into the contextual and identity-related dimensions of L2 use. More strictly CA-based SLA studies emerged some years later, and have intensified since.

In a first phase, these studies investigated classic objects of CA research. Analysis of repair practices in L2 talk-in-interaction within or outside the classroom (Kurhila, 2006), of word searches, of precision timing, and of many other objects (see e.g. the papers collected in Gardner & Wagner, 2004) contributed to a better understanding of the L2 speakers’ communicative practices and occasions for learning. These studies also shed light on the social and contextual sensitivity of learning-related practices such as repair. For instance, a number of studies show that in interactions outside of the classroom, ranging from everyday conversations to institutional interactions, first language (L1) speakers provide other-correction only when (implicitly) invited to do so by the L2 speaker.

CA work carried out on L2 classrooms helped us understand the “architecture” of the language classroom (Seedhouse, 2004) as well as the collaborative accomplishment of pedagogic interactions (Markee, 2000; see also the papers collected in *Modern Language Journal*, 2004, 88[4]), showing for instance how “tasks” are locally enacted and transformed

throughout the moment-by-moment unfolding of talk, and how boundaries between classroom activities are negotiated and reformatted (Mori, 2004).

Also, CA-SLA work of this first phase uncovered the new insights that can be gained in understanding learning opportunities and learning behaviors from the perspective of the L2 speakers and their coparticipants. On the basis of this *emic* perspective (for detailed discussions see Firth & Wagner, 1997; Markee & Kasper, 2004; Seedhouse, 2004), notions of learner, native and non-native speaker or expert have been criticized as reifying a static, aprioristic characterization of participants in social interaction (Firth & Wagner, 1997)—characteristics that often do not correspond to what participants actually do (e.g. the “learner” does not always behave as a learner, nor does the “native speaker” necessarily behave as a native speaker).

This body of research contributed to a better understanding of how the details of interactional practice potentially shape learning processes (e.g. through word searches or repair) and of how learning environments are continually constructed and transformed through the course of social interactions. Here again, CA-SLA offers a distinct view of some core SLA issues, illuminating, for instance, how what the analyst may identify as learner “error” is treated by the participants themselves, and how that interactional treatment creates occasions for what has classically been cast in terms of “attention focus,” “noticing,” and “corrective feedback,” and ultimately for learning. While some of the work cited developed programmatic statements about learning (Firth & Wagner, 1997; Mondada & Pekarek Doehler, 2004), empirical evidence for L2 learning was scant in the earlier work (but see Brouwer & Wagner, 2004, for preliminary observations). In 2006, Kasper stated that CA-SLA’s “potential for L2 learning has been largely unexplored” (p. 83). Within the few years since, CLA-SLA has experienced a sea change: A growing body of research empirically documents learning in terms of both the emergence of L2 linguistic patterns and the development of L2 interactional competence.

Analyzing Learning

Two interconnected objects of L2 learning are studied in current CA-SLA. Studies that are concerned with the local observability of learning processes investigate how patterns of language use are jointly elaborated and restructured within courses of practical activities, mostly across short time spans. Studies that are concerned with L2 interactional development typically use a longitudinal research design in order to observe development in terms of the increased diversification of speakers’ methods for accomplishing social actions in talk. The general focus is on how participants themselves orient to language as a resource for or an obstacle to communication, rather than on what represents a correct or an incorrect target-language form.

Evidence for Learning I: The Interactional Configuration of Linguistic Patterns

Recent microanalytic studies of learning processes across short time spans have demonstrated how participants’ cognitive orientation toward linguistic forms is organized through the sequential deployment of turns at talk. These investigations go beyond local mechanisms of repair or negotiation in order to account for how participants progressively, repeatedly, and collectively structure their linguistic resources and how they reuse them in new interactional environments.

Markee and Seo (2009) show an L2 speaker in an English as a second language (ESL) tutor–tutee interaction engaging in a lengthy interactional negotiation where her initial wording *many time* is other-repaired as *much time*. The analysis documents how, through-

out the fine-grained tissue of interaction, the student both experiences and displays change in cognitive state, moving from non-understanding to understanding of the proposed linguistic form. Then, some 60 seconds later, the student reuses the target-language form while smiling and gazing at the tutor, thereby portraying her reuse as a consequence of the joint negotiation undertaken earlier on. The study provides evidence for short-term learning as interactionally occasioned and oriented to as such by participants.

Pekarek Doehler (2010) documents a similar case, but related to longer-term learning, within the French L2 classroom. The analysis first shows how, in a student-initiated negotiation sequence around the French verb *adorer* 'to adore', the student's cognitive orientation toward language and learning (attention focus, noticing, and understanding) is organized through the sequential deployment of turns at talk. The analysis then provides evidence for learning: One month later, the same student reuses the verb *adorer* in a new communicative environment. By means of prosody, gaze, and body posture she tags that word for her coparticipant as the product of their previous interaction, thereby publicly displaying her learning as being contingent on a shared interactional event.

These and other studies demonstrate, from an emic perspective, how participants themselves exhibit orientation toward (and ongoing assessment of) each other's language expertise or cognitive states (Kasper, 2009; Mori & Hasegawa, 2009), and toward learning opportunities that they contribute to construct (Mori, 2004; Firth & Wagner, 2007). Such evidence opens an interesting window onto the *process* of learning, helping us to understand what learning is for the learner and his or her coparticipants. It demonstrates how socially contingent, mutually occasioned cognitive processes emerge out of the course of interaction, and how, thereby, linguistic structure is occasioned by the micro-details of social interaction. Such evidence corroborates a view of language learning behavior as a socially distributed activity and empirically counters a cognitive-individualistic perspective on learning.

Evidence for Learning II: L2 Interactional Competence and Its Development Over Time

Recently, a small number of studies have investigated the development of L2 interactional competence over time.

Tracking the same dyads of adult English as a foreign language (EFL) learners in the classroom across several months and even years, Hellermann (2008) documents their practices of opening tasks, of telling stories, and of disengaging from an activity. For instance, story openings by beginning learners are done *in medias res*, with little or no use of framing devices such as time locators ("one day") or pre-sequences, while intermediate-level learners show increased use of such devices. The study hence documents interactional development as observable through changes in the sequential organization of a practice. Cekaite (2007) combines the framework of language socialization with CA methodology in a longitudinal, microanalytic study of a Kurdish immigrant child in a Swedish classroom. She documents how the learner's turn-taking behavior changes across time from silence, through inappropriate turn taking (e.g. use of "heavy" attention-getting devices), to appropriate identification of slots for turn taking. In a cross-sectional study of French L2 classroom interactions, Pekarek Doehler and Pochon-Berger (2011) document interactional development in terms of a diversification of speakers' methods for doing disagreement. With the advanced learners, disagreement prefaces emerge that reveal an increased sensitivity to the preference organization of talk-in-interaction.

These studies and a few others (e.g. Hellermann, 2007) show that interactional skills related to turn taking or the sequential organization of a given practice are to some extent relearned or recalibrated in the L2, and not just automatically transferred from the L1. The

attention paid to the details of the linguistic system, however, is scant in the research cited. A notable exception is Ishida's (2009) analysis of a Japanese L2 learner in a study-abroad context. Ishida retraces how the learner's use of the Japanese particle *ne* (sometimes compared to English *isn't it* or *you know*) is progressively diversified both in its interactional function and in its sequential environment, which she interprets as evidence for L2 interactional development.

In the research cited, evidence for learning is provided in terms of the increased diversification and local efficacy (i.e. relevance for this specific action, for these interlocutors at this sequential moment of their interaction; see Brouwer & Wagner, 2004) of speakers' methods for accomplishing social actions in talk. While contributing to an empirically grounded understanding of interactional competence and its development, the studies also outline a useful methodology for analyzing the development of L2 interactional competence by looking at recurrent interactional micro-practices. By focusing not primarily on new linguistic forms but on the diversification of methods for accomplishing talk-in-interaction (among which language is a central resource), the studies contribute to a redefined, more holistic understanding of what the object of L2 development is.

Conclusion

Since the mid-to-late 1990s, CA-SLA has helped us understand the detailed unfolding of the learner's communicative practices and learning activities, thereby breaking down any ontologic division between the cognitive and the social, between language and action, between language learning and language use. Research in the field has contributed to a better understanding of how the details of interactional practice may shape learning processes and how the latter are sensitive to issues of identity, context, or role as they are locally enacted. The conceptual and methodological apparatus of CA has also allowed the specifying of key concepts in the field of SLA in procedural, interactional terms: understanding (Kasper, 2009), participation (Brouwer & Wagner, 2004; Hellermann, 2007, 2008), competence (Pekarek Doehler, 2006), and learning (Firth & Wagner, 2007). And the identification of the systematic procedures speakers employ to engage in talk-in-interaction with limited linguistic means has given rise to a view of the L2 speaker as a capable social agent, developing sensitive methods for action and interaction, rather than as a deficient target-language user.

A promising future path for the field is to look more closely at learning as a process: CA's fine-grained methodology enables us to track how patterns of language use emerge out of the process of talk-in-interaction. Also, interactional development over time is gaining increased attention, whereby L2 resources are viewed as part of a wider range of methods by which members organize their L2 interactional conduct. With both these future paths to venture on, CA-SLA will face the need to critically assess how far the conceptual and methodological apparatus of ethnomethodological CA is suited to tackle issues of change across time (Kasper, 2009).

Conversation Analysis and Self-Repair

BARBARA A. FOX

This entry builds on “Conversation Analysis and Repair Organization: Overview” and examines the first and most frequent site of self-repair, namely same-turn self-repair. The three other opportunities for self to initiate repair (transition space, third turn, and third position) are discussed in the general review of repair.

Initiators

When a speaker encounters some trouble in achieving progressivity of the current turn construction unit (TCU), the speaker may initiate repair during that TCU. In English the most common initiators of same-turn self-repair are nonlexical: cutoff (Schegloff, Jefferson, & Sacks, 1977; Schegloff, 1979; Jasperson, 1998, 2002), *uh/um*, and silence (Schegloff, 1979). Cutoff is a full or partial closure, typically glottal (although other places of closure, such as alveolar, are possible) which stops the production of the current sound and delays production of the next sound due. Although there have been claims that cutoff is not used as a repair initiator in languages with phonemic glottal stop, recent evidence suggests that this is in fact not the case (see Fox, Wouk, et al., in press, for Chinantec and Persian).

Schegloff (1979) refers to cutoff as a postpositioned initiator, in that it typically initiates repair on something that has come before.

Uh/um is produced interstitially, after the completion of a word, and is often accompanied by silence (Schegloff, 1979). It often initiates a word search, or possibly the formulation of something interactionally delicate. There is some evidence that *uh* and *um* accomplish different kinds of delay work, namely that *uh* initiates a “minor” delay while *um* initiates a “major” delay (Clark & Fox Tree, 2002, p. 73). Schegloff (1979) refers to *uh/um* as prepositioned initiators, in that they tend to come before the items they initiate repair on. Of course, *uh/um* can operate retrospectively as well (Schegloff, 1979).

Lexical initiators are more common in languages other than English, although English speakers do on rare occasions initiate repair with *y’know* or *I mean*. Finnish and Estonian are two languages that are known to show quite frequent use of the negative marker *ei* (Hennoste, 2006) as a repair initiator. For a discussion of different initiators in Finnish, see Laakso and Sorjonen (2010).

Same-Turn Self-Repair Operations

Same-turn self-repair manifests in several forms, two of which—recycling and replacement, and their various combinations—appear to be the most frequent. Recycling is the repetition of some bit of talk, including affixes, words, phrases, and even entire clauses. Consider excerpt (1), in which Ann repeats the word *that*:

(1) [Chinese dinner]

01 ANN: I, had a big fight with Downey at school.
02 (0.7)
03 BET: mh- [()].
04 ANN: → [oh tha:t, that’s another thing that-

2 CONVERSATION ANALYSIS AND SELF-REPAIR

Replacement targets some bit of talk and replaces it with some new talk, as in excerpt (2) below. In this fragment, Donna has been telling her recipients about the track where she sometimes does her morning walk. At line 7 Donna produces what could be heard as a trail-off *so* (Local & Walker, 2005), and there is no further pursuit of the topic. After another sequence-closing utterance at line 11, Mom starts up a related but new telling (the Bolder Boulder is an annual 10 k race, and the participants are discussing walking on a track). She begins the telling with the name of a copresent participant (her daughter), and replaces the name with the pronoun *we*:

(2) [at the farmhouse]

01 DON: what is that shredded tire or something
02 (maybe) (0.3) that ([])?
03 LAU: [is that what it is?=
04 DON: =that's what I've heard.
05 (0.4)
06 MIC: hmmm=
07 DON: =so,
08 (0.5)
09 (?): ()
10 (1.3)
11 DON: anyway
12 (0.2)
13 MOM: → yeah, Laur- (0.2) we were training for the
14 Bolder Boulder oh this was probably about
15 five years ago

Replacements can be pre- or post-framed with recycling, as in excerpts (3) and (4). In excerpt (3) the speaker pre-frames the replacement of *tha-* with *Monarch* (the name of a local high school) by recycling *opening*.

(3) [at the farmhouse]

01 LAU: well you know when they were first talking about
02 → opening tha- (0.5) opening Monarch, I was talking
03 with a lady from work and she's like

In excerpt (4), Jenn seeks clarification about what another speaker means in a discussion about feelings of dissociation from the body; the speaker replaces *do* with *are* and blends back into the originally projected talk by post-framing recycling of *you*:

(4) [housemates]

01 JEN: >right< but do you physic- do you see the
02 image (.) of you .hh from: the third person
03 → position? or do you- are you just like
04 being hyper aware of yourself.

Insertions and deletions can also be found, although deletions are quite rare. A somewhat infrequent form of repair could be called “abandonment”; in such repairs the speaker begins a TCU and then abandons it, beginning instead a new TCU. For example, in excerpt (5), Bonnie starts to tell Jenn about a movie that she and Terr had seen the previous evening. However, both Jenn and Terr are attending to Terr placing a piece of lettuce on

the mouth of a Barbie doll's head which is on the table. At line 4 Bonnie begins an utterance with *And there's*, cuts off, and then a long silence unfolds in which Terr attempts to get the lettuce to stick to Barbie's mouth; Bonnie then resumes the telling with a new TCU (*Mike Myers plays...*)

(5) [housemates]

- 01 BON: heh s(h)o we saw this movie last night? right,
 02 ca[lled Austin Powers?
 02 JEN: [yeah
 03 TER: (why won't this) stay.
 04 BON: → oh my god. and there's- (0.9)
 05 TER: mm[mmm-m ((*placing lettuce on doll head on table*))
 06 BON: → [Mike Myers plays like the good guy and the bad guy:?

One also finds word searches and placeholder repairs. Word searches form a particular class of same-turn self-repairs in which the speaker displays trouble in finding the next word due. In English, word searches are often initiated with *uh/um* and silence, sometimes exhibiting a series of *uh/um* plus silence. Word searches lead to a set of possible outcomes: successful finds of the sought-for word by the speaker, successful finds of the sought-for word by the recipient (with confirmation by the speaker), and failed searches by the speaker (and possibly the recipient). Gaze from the speaker to the recipient during a word search often serves to elicit help from the recipient in finding the word (Hayashi, 2003). An example from English of a failed word search (for the name of the organization that called), followed closely by a successful one (for the name of the location of the event), is given in excerpt (6) (CU is the name of a local university):

(6) [at the farmhouse]

- 01 LAU: (but) I got the- (2.3) oh I don't remember (0.3) who it
 02 was (0.8) that called (0.5) ('n-) I just totally spaced
 03 out the name (0.9) but it's um, that polic:e (0.5) deal=
 04 >they always bring in a-< (0.3) singer: (0.5) and a
 05 comedian, (.) and play down at- (1.2) cee u ((CU))

As this fragment begins, the speaker begins a TCU, cuts off, and then a long silence unfolds, during which she lowers her head and completely withdraws her gaze from her recipients. She displays the failed outcome of the search with *oh I don't remember (0.3) who it was*, another long pause unfolds, and then another announcement of the failed search *I just totally spaced out the name*. She continues with a work-around (*police deal*), followed by a description, which itself includes a search for the location of the playing—during the 1.2-second silence, Laura produces repeated pointing toward a location removed from the participants' location, and then retrieves the name of the location (CU). Thus while the first search fails, the second search is successful.

Placeholder repairs (Wouk, 2005) are a subset of word searches in which the speaker produces a “dummy” lexical item—in many languages marked with appropriate morphology for the sought-for word—while they continue to search for the word; if the word is found, a new version of the phrase is produced which replaces the placeholder with the sought-for word (see Fox, Hayashi, & Jaspersen, 1996; Amiridze, Davis, & Maclagan, 2010). Although English speakers make infrequent use of this strategy (with placeholder items like *whachamacallit*), some languages, such as Japanese, Indonesian, Russian, Udihe, and Udi, make fairly extensive use of it (see Hayashi, 1994; Wouk, 2005; Ganenkov, Lander, & Maisak, 2010; Podlesskaya, 2010).

Syntactic Changes Accomplishable by Self-Repair

In English there are a variety of syntactic changes that can be accomplished by same-turn self-repair. Schegloff (1979) lists the most frequent set: A modifier can be inserted within a noun phrase (and other phrase types as well); a main clause can become a complement or subordinate clause, and vice versa; one interrogative type can be converted into another, as well as converting a declarative into an interrogative, and vice versa; and elements in a clause can be reordered. In addition, we have found that same-turn self-repair can change the prosody of a word or phrase (and, in tonal languages, the tone), as well as change the tense/aspect of a verb; replace a definite article with an indefinite one, and vice versa; convert a noun phrase into a prepositional phrase; and delete modifiers from various phrase types (Fox et al., in press). In some languages, such as Japanese and Finnish, it is possible to replace one bound morpheme with another (Hayashi, 1994; Karkkainen, Sorjonen, & Helasvuo, 2007).

Linguistic Resources and Self-Repair Crosslinguistically

Recent work has found that the morphosyntactic practices of a language shape certain facets of self-repair organization. Hayashi (1994) was the first to note the possibility that differences in word order, morphological structure, and frequency of non-overt arguments might produce somewhat different self-repair practices than those previously described for English. Subsequent research has confirmed Hayashi's initial hypotheses for a range of languages (Fox et al., 1996; Fincke, 1999; Wouk, 2005; Karkkainen et al., 2007; Fox et al., in press). Fox et al. (in press) have found that all of the languages examined (Bikol, English, Finnish, German, Hebrew, Indonesian, Japanese, Korean, Mandarin, Persian, and Sochiapam Chinantec) have a tendency to recycle single words, even English, although English shows the weakest tendency of all the languages. What is perhaps more interesting is that all of the languages, including English, display an extremely strong preference for recycling within a "processing word" (Bybee, personal communication), that is, elements which together form a highly entrenched unit. For example, if we look at the longer recyclings in English, of three or more words, we see things that are made up of words that occur together extremely frequently (*as soon as, if all else, do they go, that was really, I went in, you can get a*).

This fact suggests that recycling, including pre-framing of replacements, stays within the boundaries of highly entrenched units, and that languages vary in the size of such units, with English at one extreme with longer processing words (made up of several "words") and languages like Indonesian at the other extreme with shorter processing words (typically made up of a single word).

Hayashi (1994) and Fox et al. (1996) suggested that these findings regarding scope of recycling in Japanese and English might be revealing of turn-taking practices in both languages, with English turn beginnings being highly grammaticized and thus allowing for early turn projection (and recyclings back to turn beginning), and Japanese turn beginnings being less grammaticized and providing for weaker turn projections (and fewer recyclings back to turn beginning). Of course there are many other sources of projection in conversation—sequential location, action environment, prosody, and visual/body movements all play an important role in projecting how and when a turn-in-progress might come to completion. Nonetheless, to the extent that morphosyntax and the prosody of processing words play a role in turn projection, English appears to be quite unusual in providing substantial patterns of expectation from early on in the utterance.

Interactional Functions of Self-Repair

In her groundbreaking 1974 study, Gail Jefferson provided compelling evidence that same-turn self-repair is not just a reflection of cognitive difficulties in pursuing progressivity, but rather that important interactional work is being accomplished through “correction,” and the apparent avoidance of “correction.” She proposed that speakers orient to the Error Correction Format—Word1 + Hesitation + Word2—through which Word2 is heard as replacing, rather than continuing from, Word1 (see Jasperson, 1998, for an elaboration of this format). On the basis of an orientation to this format, speakers can produce utterances such as *the k- officer*, hearably producing the smallest bit of a word (in this case, voiceless velar closure), and know that their recipient will hear that to be a word in the same domain as *officer*, and replaceable by *officer*. Through this procedure the speaker can get the recipient to hear that *cop* has been replaced by *officer*, and thereby to indicate that the speaker is the kind of person who would normally say *cop*, but in deference to the kind of person the recipient is seen to be (in this case, a judge) has chosen to say *officer*. Through self-repair a speaker can thus accomplish important interactionally situated identity work.

Self-repair also accomplishes many other interactional functions. It can be used to delay a dispreferred response. It is a device for eliciting recipient gaze, if the recipient is not gazing at the speaker (Goodwin, 1979; 1981). Self-repairs occur regularly in topic changes (Schegloff, 1979; see also excerpt [2] above). One type of self-repair, namely recycling, is commonly used in the event of overlapping talk, to get the speaker “into the clear” (Schegloff, 1987; see also excerpt [1] above).

Conclusion

Although from a certain perspective, repair might seem to be a prototypical example of chaotic “performance” data, research has revealed a tremendous degree of organization at every level.

Conversation Analysis and Therapy

DON BYSOUTH

Conversation analysis (CA) as applied to therapy represents an approach to the study of therapeutic interactions (i.e. interactions that involve professional therapists and clients engaged in a wide variety of therapeutic approaches in a diverse range of settings) that might best be regarded as representing a rigorous analytics of the sequentiality of therapeutic actions. Some of the earliest CA work explored interactions that occurred in therapeutic settings, with pioneering work done by Sacks on suicide prevention telephone hotlines and examinations of a group therapy session (Sacks, 1992). Subsequent early work examined more specifically therapeutic practices (Turner, 1972) and how therapists could produce (re)formulations of clients' troubles-talk into matters more amenable to psychological remedy (Davis, 1986). Following from these there has been growing and sustained consideration by CA scholars of the discursive practices involved in therapy settings, given that talk itself is the principal means by which therapists provide professional services to clients (with psychotherapy, after all, known as the "talking cure"). More recent CA work has examined a range of psychotherapeutic settings, contexts, and theoretical and practical approaches in order to elucidate the techniques employed by therapists and clients as practical skills and the products of their work as demonstrable achievements. In short, CA studies of therapy seek to uncover how therapy, that is, therapeutic talk and interaction, is produced as a possibly distinct and discrete mode of human conduct.

Where CA investigations of therapy differ from other linguistic and social scientific approaches to the study of therapy and therapeutic practice is in the importance CA accords to action, the sequential organization of action, and the level of detail required for any empirical examination. CA examines in fine detail the moment-to-moment interactions that take place in individual psychotherapy interactions.

CA investigations have examined a wide range of therapeutic approaches including cognitive behavioral, psychoanalytic, person centered, narrative, and integrative approaches, and have examined both individual and group-based interaction. While Sacks's early writings and lectures on therapeutic interactions do not represent a systematic approach to the study of therapy, they have nonetheless provided the inspiration for numerous key studies of therapy and counseling over the past several decades, and of how a range of practices across different therapeutic styles and settings may share common organizational features (Peräkylä, Antaki, Vehviläinen, & Leudar, 2008). Studies have focused on providing detailed examinations ranging from single psychotherapy sessions (e.g. Gale, 1991) to the study of group therapy settings (e.g. Arminen, 1998). Studies of a range of settings include examinations of materials from child counseling settings (e.g. Hutchby, 2002), psychiatric consultations (e.g. Bergmann, 1992), and investigations of psychotherapy intake interviews (e.g. Czyzewski, 1995). Important work has also been undertaken on how counselors can elicit talk from clients on extremely delicate matters, perhaps a hallmark of therapeutic interactions, for example in HIV or AIDS counseling and guidance (Peräkylä, 1995; Silverman, 1997).

Peräkylä et al. (2008) have proposed that CA studies of therapy can profitably examine psychotherapy interactions by distinguishing between initiatory (projecting for a response)

and responsive actions. In addition they have suggested a focus on the institutional character of therapeutic interaction with examinations of particular actions (the components of a relevant initiatory or responsive sequence, such as a question–answer sequence), the local consequence of such actions, and the therapeutic function of such actions (e.g. how such actions relate to the psychotherapeutic objectives in a given interaction). Briefly, some actions that have been the focus of CA investigations include questioning, history taking, formulation, advice giving, advice receipt, client resistance, and a growing concern with the management of epistemics and emotion talk (e.g. the status of utterances relating to thoughts and affective states).

Actions that have received considerable attention in CA studies of psychotherapeutic interactions are those associated with doing “formulation.” Formulations are a range of practices that involve one speaker proposing a version of what a prior speaker has said, and have been investigated in therapy settings to elucidate how alternate versions or recastings (“reformulations”) of clients’ talk are performed by therapists in order to achieve therapeutic aims (e.g. Davis, 1986; Antaki, Barnes, & Leudar, 2005). Such formulations may often involve “idiomatic” or proverbial expressions (i.e. talk that is of a decidedly everyday or ordinary form) when they feature in therapy (Antaki, 2007). In this regard, Antaki (2008) argues that such practices of formulation are a key resource in psychotherapy and can be observed in a range of undertakings, for example in how therapy sessions are managed, client history taking, when clients resist formulations provided by therapists of their problems, and when therapists provide psychotherapeutic interpretations. With regard to particular types of therapy, studies have examined the practices by which interpretations are produced in psychoanalytic therapy (e.g. Vehviläinen, 2003; Peräkylä, 2004; Forrester & Reason, 2006), and how core concepts in psychotherapy such as “empathy” can be understood as interactionally produced in different settings, for example in telephone counseling (Pudlinski, 2005) and face-to-face settings (Wynn & Wynn, 2006).

Recent areas of topical interest for CA studies of therapy include the study of nonverbal aspects of therapeutic interaction, for example in psychodynamic therapy enactment (e.g. Streeck, 2008), how thoughts and feelings are produced as displays in therapeutic interactions (e.g. Bysouth, 2009), and how the therapeutic orientation of particular therapies and therapists is made consequential in therapeutic interactions (e.g. Leudar, Sharrock, Truckle, Colombino, Hayes, & Booth, 2008).

CA scholars suggest that CA provides a way to clarify various aspects of psychotherapy that have remained essentially invisible to other research methodologies. For example, Peräkylä and Vehviläinen (2003) have proposed that professionals working with clients exercise a range of competencies drawing on particular therapeutic theories and techniques as “professional stocks of interactional knowledge” (SIKs), and that a CA orientation applied to the fine-grained details of therapeutic interactions might complement the more abstract or generic SIKs. Such approaches are notable in that they may be provided by CA scholars who are practicing psychotherapists (e.g. Peräkylä et al., 2008) and therapists with an interest in CA (e.g. Streeck, 2008). In this sense, ongoing reflections on CA as an analytic method applied to therapeutic practice by practitioners might provide linkages between the theoretic neutrality of CA with regard to various psychotherapeutic approaches and how CA findings may inform actual therapeutic practice.

CA studies are conducted with an eye toward how therapists and clients interact to produce something describable as therapy, by attention both to the generic features of social interaction that have been elucidated in previous CA studies, and to the micro-details of specific therapeutic interactions to illuminate the various practices that constitute a wide and diverse range of psychotherapy approaches. While CA of psychotherapy has become a major area of research interest, is important to note that findings concerning these investigations have until recently been fragmented in comparison to CA studies of other

institutional interactions, which appear to have made more substantial progress (e.g. studies of medical consultations, news interviewing, legal settings). The challenge for a more unified approach to CA studies of psychotherapy is how to integrate findings drawn from examinations of heterogeneous psychotherapeutic theories and practices in order that CA might provide understandings of generic phenomena while capturing the unique elements of particular psychotherapeutic undertakings.

Conversation Analysis and Transcription and Data

JOHANNES WAGNER

Transcriptions and Data

Media subtitles provide transcriptions of the spoken word. Playscripts are transcriptions that provide instructions on how dramatic talk and play should be created. Courtroom transcripts are routine records of trials. Interviews of public figures are often transcribed for publication. In each of these applications, transcription transforms spoken language into written text. In many fields of research, transcription has developed into a highly sophisticated tool, because any research that deals with talk and interaction needs valid and detailed transcription. This is especially true for conversation analysis (CA) and ethnomethodological CA (EMCA), since transcripts are a core resource in the analytical practice.

It is paramount for CA to point out that transcriptions are not the object of the study. The object to be studied is social conduct in its ecology. Recordings are secondary to the real thing, but they are a necessity for systematic study. And transcriptions are, in turn, secondary to recordings. Transcriptions are a research tool to identify interesting phenomena in the data to be studied. A detailed transcription indicates both the words being produced and the ways in which they are produced. CA studies have demonstrated extensively (e.g. Jefferson, 1984, 2010; Gardner, 2002) that the “content” of talk cannot be isolated from the way talk is produced and heard.

Recordings and Data

Since interactions happen in real time, they are only “available” here and now. Recordings transform ephemeral interactions into permanent objects and allow researchers to study their details by watching and listening to them repeatedly. In Heritage’s words:

The use of recorded data is an essential corrective to the limitations of intuition and recollection. In enabling repeated and detailed examination of the events of interaction, the use of recordings extends the range and precision of the observations which can be made. It permits other researchers to have direct access to the data about which claims are being made, thus making analysis subject to detailed public scrutiny and helping to minimise the influence of personal preconceptions or analytical biases. Finally, it may be noted that because the data are available in “raw” form, they can be re-used in a variety of investigations and can be re-examined in the context of new findings. (Heritage, 1984, p. 238)

CA has not defined any specific *technical* standard for data collection. Depending on the state of the art of the recording technology, CA researchers try to get the best data that recording techniques are able to produce. But CA researchers may also work with pitifully low-quality recordings (e.g., Jefferson’s transcription of the Watergate tapes at

www.talkbank.org), if the available data happen to be in that form. For CA, the issue is not the technical but the *interactional* quality of data. Good data come from interactions that are minimally influenced and structured by the recording activity. They should be—as far as possible—recordings of consequential real-life social activities that the participants would have undertaken anyway.

It is frequently discussed whether recorded data are sufficient for an analysis or whether the researcher needs to collect ethnographic details and do field studies as part of the process of data collection (e.g., ten Have, 1999, p. 58). Many classical CA studies use data from accidental recordings for which not much is known about the people who were recorded. In other cases—especially in institutional interaction and workplace studies—data were recorded in the context of careful ethnographic fieldwork (Heath, 1997), as in the case of Whalen (1995), who worked as a call-taker and emergency dispatcher at police and fire departments when he studied the structure of emergency calls.

The issue is not so much the amount of ethnography done by the researcher as his or her membership knowledge of the situation and its ecology. For the analysis of mundane everyday interactions, specific ethnographic data may not be necessary, and the researcher can draw on his or her cultural membership, whereas the examination of institutional or workplace interactions might require that the researcher conduct extensive ethnographic studies or even undergo specific professional training.

Recording interactions in real life poses the question of ethical concerns (Taylor, 2001). Increasingly, universities and other research institutions register and control all research on human subjects, and new research projects need to be approved by committees designed to guarantee the ethical conduct of research with human subjects. Preferably, recorded participants will sign *informed consent* sheets that specify how the data can be used (e.g., in publications, at conferences) and the possibilities of data sharing. Examples of such consent forms are available at <http://talkbank.org/share/irb>.

Transcription

Any transcription implies a reduction of the rich ecology of interaction (e.g., talk, prosody, embodiment, and artifacts) to what can go onto a page of text. Transcribers need to make choices about what will be represented and what will be omitted, as well as about the form that the representations will take. However, what is omitted and what is represented in the transcription is not an unproblematic choice. It is informed by and has consequences for the analysis and the ultimate quality of the research. Good transcriptions avoid formulating generalizations and stereotypes about the participants (Jefferson, 1996).

Transcribers' choices are not objective. They are results of an interpretive process that has been discussed in many publications (Ochs, 1979; Edwards & Lampert, 1993; Green, Franqiz, & Dixon, 1997; Roberts, 1997; Bucholtz, 2000; Vigouroux, 2009). In ten Have's words, transcriptions are "'theory laden' renderings of certain aspects of what the tape has preserved of the original interaction" (ten Have, 1999, p. 77).

While core data for early CA were dyadic talk, often on the phone, many recent CA studies analyze video recordings of multiparty interactions. The stakes for transcribers become especially high when transcribing video recordings. These are not a "transparent window on social interaction" (Mondada, 2009, p. 68), but are themselves products of recording and editing practices that arise from the analyst's ways of seeing. In this way, just adding stills to the transcript does not produce analysis. As Goodwin (1994) has shown in detail, videos and the way they are presented frame the understanding of the analyzed segment. In his study of the court deliberations on the Rodney King trial, Goodwin demonstrates how the modification of visual material supports certain ways of seeing and understanding the overall interaction. In his work, Goodwin (e.g., 2000) marshals transcription, drawings,

4 CONVERSATION ANALYSIS AND TRANSCRIPTION AND DATA

Excerpt (1) demonstrates that the balance between readability and technical accuracy is a crucial issue for transcribers. Transcriptions written for machine analysis—such as the early child language transcriptions in CHILDES—may include all kinds of notations, while a transcription designed primarily for consumption by the human eye needs to refrain from overdoing such richness of coding detail. These various levels of granularity are notoriously difficult to define and even more difficult to control consistently over larger numbers of data.

Economy

Detailed transcriptions of audio recordings are very time- and cost-intensive. Even experienced transcribers need to calculate at least a ratio of 60:1 for high-quality recorded dyadic interactions, such that 1 minute of data takes at least 60 minutes of transcription time. When recordings involve multiparty interaction, this ratio goes still higher.

It is even more difficult to estimate the time that would be required for accurate transcription of video recordings. Although the availability of video can help speed up transcription of the spoken word, the additional transcription of gestures, gaze, proxemics, and placement can be extremely time-consuming. Presently, no system of annotation for these nonverbal streams has been developed which can match the precision of notation systems for the verbal stream. As a result, researchers typically improvise when annotating the embodied aspects of interaction.

Page Design

CA transcriptions generally follow a transcription design developed by Gail Jefferson. The transcription is laid out as a text page. In instances of overlap, parallel lines are established. Excerpt (2) is again taken from Jefferson (2010).

(2)
01 NIX: r^hi(h)ight.h[.huh
02 PET: [uh:: I jis(.)tuh cain't ↑say anything
03 ↓ab_{gh}out i_{gh}t. o[ne way]=
04 NIX: [thet's]
05 NIX: [r i g h t.]
06 PET: [er anow]ther I don' wunnuh c'nfirm in I don'
07 wunnuh den[y it.
08 NIX: [.t
09 NIX: so ther prab'ly write a story _{gh}un th_hə:t. .[hunyah]
10 PET: [u h,]
11 hhhh I don't knəw.

Another format was devised by Ehlich and Rehbein (1979). They developed a *partiture* or “musical score” format where one single tier is assigned to every speaker. For each speaker, the transcription allocates one potentially endless tier. The transcription contains as many tiers as there are speakers, plus any number of comment and coding tiers that can be added to each speaker tier. Only when they are printed on a page do partiture transcriptions break lines.

In partiture transcriptions, the transcriber needs to make fewer analytic choices when transcribing. In the Jefferson formats, decisions constantly have to be made when and where a line should be broken. Depending on the theory of the transcriber, new turns, new turn construction units or new tone/breath groups may be the criteria for breaking the line. This is not necessary in a partiture design.

The disadvantage of partiture editors is that they only show a small segment of the interaction on the screen. Obviously, a full partiture transcription of excerpt (1) cannot be displayed on a normal page. In a partiture layout, lines 3–5 of excerpt 2 would look as follows

(2a)

PET: i_{gh}t. one way= er anowther I don' wunnuh . . . deny it

NIX: thet's right. .t

A third layout has been suggested by Ochs (1979), who argued that the spatial arrangement of a transcription is not neutral but shows—or hides—relations between speakers. She suggests a format with a column for each speaker. However, the column format is rarely used today.

Transcription Conventions

Transcription conventions are a link between identifiable features of talk and a symbol used to note this feature. Many conventions have to do with issues of timing since timing is central for the understanding of talk. If features are well defined, transcription notations can be translated into each other. Most transcription systems attend to the following issues:

1. General features that are commonly noted:
 - speaker identification;
 - transcription, comment, or coding tiers;
 - use of normal orthography versus eye-dialect;
 - criteria for line breaks; and
 - overlaps with other speakers, often marked by square brackets [].
2. Features on the unit or construction level:
 - global intonation features—Jefferson used question mark for rising intonation, full stop for falling intonation, and comma for contours which are heard as unfinished speech;
 - syncopation;
 - latching;
 - pauses, which are, according to Jefferson, marked by time values between parentheses (0.5), while pauses below 0.2 seconds are marked by (.); and
 - often, faster and slower speed of passages.
3. Features on the word level:
 - local intonation features like pitch, stress on words, and loudness;
 - stress jumps;
 - inbreath ·hh and outbreath hhh; and
 - laughter noises in the word.
4. Voice quality:
 - smiley voice,
 - creaky voice, and
 - whispering.
5. Multimodal details:
 - beginning and extensions of participant's actions;
 - gaze toward other participants and away from them respectively; and
 - gesture preparation, climax, and retreat.

Most CA practitioners use some version of Jefferson's notation system. In Germany, many practitioners use Gesprächsanalytisches Transkriptionssystem (GAT) notations (Selting et al., 1998, 2009; Deppermann & Schütte, 2008), which are less precise than Jefferson's system with respect to measuring pauses, but more precise with respect to prosodic features, noted on a specific tier. GAT also notes accentuation, tone movement, tone jumps, and high and low register. Tone changes and loudness are marked by a small repertoire of musical expressions (*forte*, *piano*, etc.).

Specific Problems

A number of specific issues arose as CA spread from the description of American and British data to other languages. Many of these issues are difficult to solve elegantly, and different researchers improvise with individual solutions:

- *Different writing systems*: CA transcription works well with any alphabetic orthography while languages with logographic writing systems, such as Chinese and Japanese, create considerable problems (Haberland, 2010).
- *Multilingual data*, in which speakers shift between different languages: Transcribers need to decide whether and how to represent words in terms of linguistic source. They need to decide about pronunciation variance and accent. If transcribers choose eye-dialect to show an accent, the transcription will inevitably be criticized as stereotyping and comic-book-like (Wagner, 2009).
- *Translation issues*: Ten Have (1999, p. 93) mentions these as problems in the publication of transcriptions. While it is unacceptable—and rarely done today—only to present the translated excerpts, many publications add a word-by-word or morpheme-by-morpheme interlinear translation to each tier as well as an idiomatic translation.
- *Multimodal issues*: The transcription of gaze, gesture, posture, and space is presently unsolved.
- *Data preservation, data sharing, and protection levels*: Although CA has produced a large number of transcriptions in the last decades, only few of these are in the public domain.

Transcription is a key issue for the quality of CA research. Since many features of talk are difficult to catch objectively in a transcription (e.g., when is talk loud enough or fast enough with respect to surrounding talk to mark it as louder or faster?), transcribers' decisions will vary and include many compromises. As Chafe plainly writes: "In my own transcribing practice, I have compromised a variety of nonfalling contours with a single symbol, the comma" (1993, p. 35). The only solution is in the development of knowledge created by transcription-based studies. When researchers have a clearer picture of the many non-falling contours, they can deploy different resources to bring that knowledge to bear on new and revised transcriptions.

Conversation Analysis and Turn Taking

CECILIA E. FORD

Introduction

Turn taking refers to a system through which interlocutors manage transfer of speakership, with each next turn in sequence displaying how that speaker has interpreted previous talk and the action so far. While it may seem self-evident that people wait for other persons to stop talking before beginning next turns, examination of recordings of everyday talk reveals that across languages pauses and overlaps are minimized. This close monitoring and management of timing means that pauses and overlaps, when they do occur, are not random but are instead orderly and socially meaningful.

In a groundbreaking article based on close analysis of audio-recorded conversations in English, Sacks, Schegloff, and Jefferson (1974) account for the split-second timing evident in turn transitions in ordinary talk. They propose that turns are composed of recognizable interactional units or “turn construction units” (TCUs). Given the recognizability of TCUs, participants can predict a turn’s trajectory and possible point of completion during the course of the developing turn rather than waiting until its end. In other words, TCUs allow participants to predict or *project* possible completion points for ongoing turns *before* such points are reached and before gaps emerge between turns. Projection of possible completion supports a system in which next speakers overwhelmingly start precisely at the ends of previous turns. Crosslinguistic research supports the existence of such a turn-taking system in all groups studied, with variations in timing and average lengths of silences between turns (e.g. Stivers et al., 2009).

Turn taking in ordinary talk is not prescribed. Participants work out speakership on a turn-by-turn basis, as well as within the course of unfolding TCUs (Goodwin, 1979). As a current speaker produces a turn, there may be opportunities for others to join in with overlapping talk or to give nonverbal responses. As a speaker approaches a projectable point of turn completion, others prepare to begin next turns. Sacks et al. (1974) divide the practices for turn taking into two components: turn construction and turn allocation.

For turn construction, the resources of specific languages support projection of what it will take for a TCU-in-progress to come to completion. For English, the language with which Sacks et al. worked, with its subject–verb–object word order, lexicogrammatical structures present one obvious basis for projection of turn trajectories. Indeed, Sacks et al. list TCUs as grammatical units: “sentential, clausal, phrasal, and lexical constructions” (1974, p. 702). Thus, Sacks et al.’s original account for turn construction foregrounds syntax as a basis for projectability. However, they note that “some understanding of ‘sound production’” is important for turn projection (p. 721; see also Ford & Thompson, 1996; Schegloff, 1996).

Turn allocation involves a set of rules for when speaker change occurs and how next speakers are selected. Each speaker is initially allotted one TCU per turn. In the course of a turn, the current speaker may select a next speaker. Recognizable courses of action across turns also contribute to speaker selection, as does the content of a turn, which may designate a particular person by reference to specific knowledge of a topic. Projectable points of possible completion constitute *transition-relevance places* (TRPs), with the term *relevance*

2 CONVERSATION ANALYSIS AND TURN TAKING

underscoring the fact that speaker change *may* occur at such points, but it is not predetermined or prescribed. If no specific next speaker is selected, a next speaker may “self-select.” If no next speaker starts, the current speaker may continue. In the latter case, the original speaker produces an extended turn.

Same-speaker continuation past a TRP is one route to an extended or *multi-unit* turn. Multi-unit turns may also be responsive to the sequential position of a turn in an unfolding sequence of action. For example, the response to a proposal may take more than one TCU to complete. In excerpt (1), B produces a multi-unit turn in response to V.

(1) [student data: 1984 UCLA]

- 01 V: but we can call her, when you get here.
02 B: → yeah. well there might not be: (.) well
03 (.) it all depends on what's going on,
04 () the weekend.

V has proposed an action for herself and B. In his response, B first minimally acknowledges the proposal but then goes on to resist outright agreement.

The sequential unfolding of a turn is monitored for how it moves toward constituting an action fitted to the particulars of an unfolding sequence of action (e.g. question and answer). Thus transition relevance is not determined by grammatical or phonetic practices alone. Action trajectories are essential components of turn projection. Stories and other larger, single-speaker agendas are set in motion through interactional negotiation at their beginnings. They are sustained through participant coordination until their ends are jointly accomplished. Conversation analytic (CA) and linguistic studies have investigated the properties and processes of such longer multi-unit turns (e.g., Jefferson, 1978; Goodwin, 1984; Houtkoop & Mazeland, 1985; Selting, 2000).

The turn-taking practices proposed by Sacks et al. (1974) are sensitive to the social specifics of improvised moments of interaction. Another source of variation relates to the number of participants in a conversation, which affects the mechanics of speaker selection and supports further minimization of gaps. Interactions with more than two speakers result in greater potential competition for speakership and a consequent further minimization of gaps between turns as the first starters gain the floor. Egbert (1997) details the orderly ways in which groups of four or more participants can lead to separation of interactional sequences or *schisming* (Sacks et al., 1974, p. 713).

With respect to research since Sacks et al.'s presentation of the turn-taking model, it is important to recognize that in the title of their 1974 article, they describe the mode as “a systematics” not “the” systematics for turn taking. Furthermore, Sacks et al. account for mundane, unscripted interaction rather than specialized speech-exchange systems such as meetings or ceremonies. A large area of CA research has involved demonstrating that adaptations of turn-taking rules are constitutive of institutional talk (Drew & Heritage, 1992). Another continuing area of development in turn-taking research addresses how turn trajectories are recognized in progress, an issue foundational to turn projection. Linguists and communications scholars have made significant contributions to an understanding of turn taking as involving multiple semiotic systems, well beyond what we traditionally think of as language. Charles Goodwin has long led the way in providing a view of multiple and simultaneous semiotic systems for turn construction and turn taking (e.g., 1979, 2000), demonstrating in numerous works that coordinated multimodal activity is both a goal of and a basis for turn taking. Scholarship since Sacks et al. (1974) has significantly expanded our understanding of lexicogrammar, embodied/visual actions, sound patterns, and the sequential structure of unfolding activities in relation to turn taking in face-to-face interaction.

Projection and the Interactional Significance of Overlaps and Delays

The precision timing of overlapping talk, be it affiliative or disaffiliative, is explained by reference to projection of turn and action trajectories as they unfold, that is, the projection of talk-yet-to-come based on talk-so-far. The social significance of the timing of turn beginnings depends on the specific placement of overlaps or pauses in relation to sequentially emergent turns and activities (Jefferson, 1984). CA research provides a typology of overlap timing (Jefferson, 1986) and an account for the orderly resolution of overlapping talk (Schegloff, 2000).

Evidence for projectability is found in common and predictable overlaps that occur as current speakers continue past points of possible completion. When a TCU moves toward projectable grammatical, action, and phonetic completion, simultaneous talk results from a next speaker starting while the current speaker continues. In excerpt (2), Helen's turn overlaps with Darin's turn continuation beyond a TRP:

(2)

01 DAR: → yeah. I mean even they live just li:ve with
02 giardia an' they li:ve with amoebas. [you know.
03 HEL: → [yeah.

Relying on multiple sources for projection, most obviously grammar and intonation, Helen artfully initiates her response in overlap with Darin's tag question. Rather than acting randomly or waiting for a post-turn pause, Helen positions her turn to coincide with a projectable TRP in Darin's emerging turn.

Collaborative completion also offers compelling evidence for projection of turn trajectories. In excerpt (3), Roger supplies a syntactically projectable main clause to complete the sentence Dan has begun. In doing this, Roger demonstrates his understanding of the content of Dan's talk, and he also shows his accurate parsing of the "syntax of the sentence-in-progress" (Lerner, 1991, p. 441):

(3) [Lerner (1991, p. 445); transcript simplified]

01 DAN: when the group reconvenes in two weeks=
02 ROG: =they're gonna issue strait jackets

Projection and the split-second timing of next-turn initiations support a semiotic system in which pauses and overlaps are social actions (or socially meaningful withholdings of action).

Overlaps may enact strong affiliation. In excerpt (4), during the sequential emergence of Dianne's turn, and clearly at a point of non-completion, Clacia times her response to overlap just as Dianne produces a degree adverbial followed by the projectable adjective:

(4) [Goodwin & Goodwin (1987); transcript simplified]

01 DIA: Jeff made an asparagus pie it was
02 s: : so [: goo:d.
03 CLA: [I love it.

In excerpt (4), projection and overlap result in the joint production of a positive evaluation, with the timing and the content of the words mutually elaborating one another.

4 CONVERSATION ANALYSIS AND TURN TAKING

Starting a turn in overlap may also reinforce a disaffiliative action. In excerpt (5), F begins speaking at a point when the action and content of C's turn are recognizable. F's early beginning is done based upon the projectable *non*-completion of C's turn so far, and in this way F underscores his disaffiliation with C's position:

(5) [Sacks et al. (1974); transcript simplified]

01 C: we:ll I wrote what I thought was a-a
02 rea:son[able explanatio:n
03 F: → [I: think it was a very rude letter.

An emerging gap after possible turn completion can project an upcoming disaffiliation:

(6)

01 BRA: .hhh so can I wear blue jeans tonight,
02 → (0.7)
03 MAU: → uh n↑o:↓(h):.(h)

A gap emerges in a place where a response is relevant, and Maureen's response is indeed characterized by further delay in the form of a hesitation marker (*uh*). When Maureen delivers *no*, she formulates it with attenuation: marked pitch movement, sound stretch, and breathiness. The 0.7 of a second delay before Maureen's response takes on meaning within a turn-taking system characterized by a norm of minimal gap and minimal overlap.

Significance in emerging silences is found in cases of additions to turns in pursuit of uptake. The same speaker regularly adds to a turn when an addressee is delayed in responding, that is, when a gap is emerging. In excerpt (7), Terry adds two grammatically and prosodically fitted increments beyond TRPs as she pursues a response from Maureen:

(7)

01 TER: we had him,(.) this summer,
02 (1.5)
03 TER: for f:i:ve weeks.
04 (0.8)
05 TER: when we were out at the campground?
06 MAU: oh really.

How do interactants project trajectories of turns such that they can so regularly start speaking just as current turns end, with minimal gap or overlap? Findings testify to the cognitive processing capacity of humans as we monitor and manage real-time and socially consequential interaction. The emergence of the linguistic subfield of interactional linguistics (e.g. Selting & Couper-Kuhlen, 2001) can be seen as one response to the notion that linguistic units are adaptations to interactional exigencies. Using CA methods, linguists have questioned traditional structural categories and worked to ground linguistic categories in empirical evidence from turn taking and turn construction, moving beyond a written language bias in understanding linguistic units (Linell, 2005).

Goodwin (1979) was early in drawing attention to the details of sound production and the interactional construction of turns, and John Local (1992) was among the earliest to combine CA with close analysis of phonetics. Intonation and rhythm have received considerable attention as well (e.g. Couper-Kuhlen, 1992; Ford & Thompson, 1996; Selting, 1996). Once underway, a turn constitutes an "interactively sustained domain of multimodal conduct" (Hayashi, 2005, p. 21). Along with Goodwin's continuing research, CA scholars

have come to treat visual bodily action as central to turn construction and turn taking (e.g. Hayashi, 2005; Iwasaki, 2009). Bodily actions may constitute pre-beginnings of turns (Streeck & Hartge, 1992; Schegloff, 1996), and they may also extend verbal actions (Ford, Thompson, & Drake, 2009).

Conclusion

The complexities of turn taking, including placement and composition of turns, constitute essential parts of meaning making in interaction. As each next turn displays the sense made of a prior action, it also provides the prior speaker with a means to inspect that next turn and offer repair. Turn taking, along with the orderliness of sequences of turns and systems of repair, must be understood as central to a socially achieved sense of intersubjectivity among interactants in real-time talk (Heritage, 1984, p. 254). For applied linguistics, attention to turn taking is proving a rich area of discovery and a valuable methodological tool. In incorporating turn taking into applied linguistic studies, however, researchers must understand that turn taking is accomplished on a moment-to-moment basis and is contingent upon situated and locally managed multimodal activity. The need for analytic sophistication with regard to turn taking and turn construction presents a formidable challenge for applied linguists intent on moving quickly to quantification in their research.

Conversation Analysis: Overview

KRISTIAN MORTENSEN AND JOHANNES WAGNER

Conversation Analysis

Conversation analysis (CA) is a data-driven research methodology, which studies the organization of naturally occurring social interactions, as they occur in real time. The aim is to describe the *in situ* relevant and recognizable practices in talk and bodily conduct through which participants make sense in interaction. CA research has accumulated over the last forty years a large number of robust results about the social order in interaction.

In contrast to most other methodologies in applied linguistics, CA insists on a purely descriptive stance to the field's classical issues. CA avoids introducing external concepts (as, for example, knowledge, intentions, beliefs, mental processes, emotions, motivation) that cannot be grounded in the participants' observable behavior, that is, cannot be shown to be something the participants orient to in the data. In other words, CA follows a strictly *emic* approach in taking participants' publically inspectable perspective in describing social interaction.

CA's insistence on describing what people do *in situ*, in real time, is not based in behaviorist psychology, but follows the ethnomethodological distinction between *topics* and *resources*. Topics are categories such as power, gender and sexuality (see CONVERSATION ANALYSIS AND GENDER AND SEXUALITY), and learning—resources are the practices and behaviors which participants use to make these topics intelligible for each other. Resources in this sense are the interactive procedures which the participants recognize as somebody “doing power,” or “doing gender,” and so on. In the study of cognition and emotion (see CONVERSATION ANALYSIS AND EMOTION AND COGNITION IN INTERACTION), CA consequently does not study what might be going on in the mind. Instead, focus lies on how participants by the way they speak make it obvious for their coparticipants that they are “doing thinking,” or that they become angry or excited, or what epistemic stance they take.

The History and Origin of CA

Conversation analysis developed within sociology in the 1960s, but has later extended into neighboring disciplines such as applied linguistics, anthropology, (social) psychology, and linguistics, and has researched practices in a large range of professions such as health, technology, media, and design. With its roots in ethnomethodology (EM) (see CONVERSATION ANALYSIS AND ETHNOMETHODOLOGY), CA aims at uncovering the taken-for-granted and unnoticed knowledge on the basis of which members interact, and in particular, although not exclusively, members' tacit knowledge about the organization of talk (see CONVERSATION ANALYSIS AND TURN TAKING and CONVERSATION ANALYSIS AND RECIPIENT BEHAVIOR). This constitutes a radical break away from the structural focus that dominated the human and social sciences in the 1950s and 1960s. According to this approach, the individual was subject to externally given (linguistic and societal) structures that defined, or even determined, human behavior. In linguistics, Chomsky (e.g., 1957) distinguished “competence” and “performance,” regarding the latter too messy to be studied in detail.

2 CONVERSATION ANALYSIS: OVERVIEW

In sociology, Parsons (e.g., 1951) explained human behavior as underlying larger societal and cultural values. Opposing this, Goffman (e.g., 1964), and later Sacks (e.g., 1967), developed social interaction into a scientific object in its own right. Garfinkel (1967) turned towards the practices that members use to make sense of and re-create their social world. CA can nevertheless be described as normative in nature, but this normativity is descriptive rather than *prescriptive*. EM and CA describe the practices which participants in interactions produce and recognize as culturally recognizable ways of “doing” social actions. Through the ways in which people interact, they orient towards social norms, for example, a *greeting* is followed by another *greeting* and *questions* are followed by *answers*, to mention some obvious examples. It is in and through behavior that social norms are enacted and upheld. In other words, people are held accountable for their actions and the absence of actions where those are normatively expected (e.g., avoiding to answer questions).

The foundations of conversation analysis proper were laid in two seminal papers by Harvey Sacks, Emanuel Schegloff, and Gail Jefferson. In the first paper from 1974, they describe the turn-taking structure (i.e., the management of speakership) as a simple but very powerful rule apparatus, through which participants orderly manage turn taking with “no gap and no overlap” (Sacks, Schegloff, & Jefferson, 1974, p. 700). Launching a new turn-at-talk is therefore not just about “speaking,” but essentially about “listening” to the ongoing talk in order to find a relevant moment to come in. To this end, a potential next speaker orients to what the ongoing turn-at-talk *projects* and when it may come to a possible completion. This projection is done grammatically, prosodically, and pragmatically. In this way, listening to the ongoing talk is a precondition for being able to participate verbally in the interaction. The second paper, published in 1977 deals with instances where intersubjectivity is under threat. This may be trouble in speaking, hearing, or understanding which needs to be repaired. “Trouble” does not refer to an externally given mistake, but what the participants treat as problematic (Schegloff, Jefferson, & Sacks, 1977). The paper outlines who (“self” or “other”) initiates and completes the repair, respectively, and finds in the structural organization of repair a preference for self-initiations versus other-initiations and a preference for self-repair (see CONVERSATION ANALYSIS AND SELF-REPAIR) versus other-repair (see CONVERSATION ANALYSIS AND OTHER-INITIATED REPAIR).

Turn taking (see CONVERSATION ANALYSIS AND TURN TAKING) and repair organization (see CONVERSATION ANALYSIS AND REPAIR ORGANIZATION: OVERVIEW) have been two major fields in CA research over the last decades. In a range of papers, Jefferson (e.g., 1984) has documented the fine-grained organization of turn transition. The different environments—from early turn beginnings to heavily delayed responses—contribute to the participants’ sense making. Delayed responses have an especially prominent status in CA research. “Preference organization” refers to a technical preference that projected next actions are supposed to be produced without delay. It has been documented extensively in CA that the precise timing of activities is a major resource for sense making. Participants understand or orient to a pause even as short as 0.2 seconds as a delay in the progress of interaction and as such as an indication of trouble. In general, recipient behavior (see CONVERSATION ANALYSIS AND RECIPIENT BEHAVIOR) and its subtle distinctions is one of the more technically challenging, but very significant topics in CA. Recently, research on responsive behavior has focused on affiliation and alignment (see CONVERSATION ANALYSIS AND AFFILIATION AND ALIGNMENT), illustrating how social relations emerge and are made relevant through the ways in which next contributions to a conversation are formed.

Another major area in CA, though it has been less studied than CA’s structural side, is membership categorization analysis (MCA) (see CONVERSATION ANALYSIS AND MEMBERSHIP CATEGORIES). MCA focuses on how categories are used in interaction. In interaction speakers design their talk for specific coparticipant(s) by the ways in which they refer to each other

(e.g., “dad,” “professor,” or “coach”). In using one classification or another, they orient to the coparticipant as a *member* of a specific social group, for which certain subcategories and actions are relevant and others are not. And likewise, the classification may be doing social work that is relevant to the ongoing interactional business.

Much of the early work in CA has used telephone interactions. These are usually held between two speakers who have no visual access to each other and where everything done is in and through talk. The initial analytic focus on the dyad (i.e., interaction between two participants) turned out to be highly useful since dyads are the most significant configurations of participants. In later research, the role of the number of involved participants for the structure of the talk has been highlighted. The number of participant in itself plays a crucial role for turn-taking constraints and creates different patterns for participation (CONVERSATION ANALYSIS AND DYADS, TRIADS, AND MORE).

From studying phone conversation, CA researchers quickly moved to the study of face-to-face interactions. While very few of the early CA data were video-recorded conversations, research on video data of very different participation frameworks has in recent years increased significantly. Video data allow the analysis of multimodality (see CONVERSATION ANALYSIS AND MULTIMODALITY) in interaction and this has become one of the most promising fields in CA.

Sense Making

For CA, talk-in-interaction is the primordial site of social life, and the natural environment of language. The workings of social relations from governments and educational systems to friendships and intimate relationship are co-constructed through interaction or more precisely *talk-and-bodies-in-interaction*. It is, in part, through social interaction that schooling is done, morality is made visible, and financial trades are accomplished. And it is through social interaction that members of society claim and negotiate their identities (see CONVERSATION ANALYSIS AND IDENTITY IN INTERACTION) (e.g., democrat, police officer, gay) and where participants recognize when someone is behaving “abnormally”—whether this “behavior” can be clinically categorized (e.g., Tourette syndrome, aphasia, non-native speaker) or not (e.g., weird, sociopath). In sum, social interaction, in all its varieties, is where participants create and engage in the social world they inhabit.

Any action is sequentially embedded in a local ecology of activities. Any action is based on earlier actions and indicates the way in which an earlier action has been understood. Any action paves the way for further actions, which will be understood on the grounds of what already has happened. CA and EM refer to this double relation of being shaped by context and shaping context as “indexicality” and “reflexivity.” “Indexicality” refers to the sense which is brought into an interaction by anything sequentially previous, “reflexivity” refers to how a new action makes sense of what has been brought in and opens up for new understanding. A first greeting by participant A, for example, responds to meeting and recognizing participant B. B’s second greeting recognizes the greeting process that can open for further activities.

Participants talk a particular context into being in and through their interaction. In this way, the participants themselves negotiate when certain (institutional) identities are relevant and when not. This is a members’ problem that participants construct interactionally through the moment-by-moment progression of the interaction. On a local level (i.e., what participants do here and now), each turn-at-talk displays the speaker’s understanding of the turns-so-far. Each turn, then, is shaped by the previous turn(s), and is itself a context for the next turn. Turns-at-talk are at the same time context-shaped and context-renewing (Heritage, 1984).

Data and Method

The technological breakthrough of (portable) tape recorders, which could record and replay any conversation was a precondition for the very detailed work about talk which shaped CA's scientific credibility. Before tape recorders were available, talk could be experienced and observed but could not be made the object of detailed scientific scrutiny. Nor could it be shared and discussed with research colleagues.

CA researchers collect audio or video recordings of "naturally occurring" interactions. This category should not be confused with "authenticity" or "naturalness" of the data. "Naturally occurring" requires that data are part of the participants' consequential social action, be it in mundane everyday or institutional environments. That is, that the interaction would have taken place even in the absence of the researcher/recording device.

Conversation analysis takes ordinary "mundane" conversation to be the most basic site of social relations and ordinary conversation has served as the empirical database for the larger bulk of CA findings. However, researchers in a variety of professions and "applied" disciplines have extended the database to include various (institutional) settings such as interviews (see CONVERSATION ANALYSIS AND INTERVIEW STUDIES) interaction in medical settings, classroom interaction (see CONVERSATION ANALYSIS AND CLASSROOM INTERACTION) and therapy sessions (see CONVERSATION ANALYSIS AND THERAPY). The organization and social structure of institutional interaction (see CONVERSATION ANALYSIS AND INSTITUTIONAL INTERACTION) are seen as variations vis-à-vis ordinary conversation, for example, in terms of how turn taking is accomplished. This does not (necessarily) mean that the phenomena described are exclusively used in these institutional settings. Rather, these studies document how participants engage in institutional interaction, rely on, and adapt practices from ordinary social life to accomplish institutional goals. CA methodology nowadays provides detailed analyses of the interactions in various institutional settings, which can inform and eventually change professional practices.

Gail Jefferson developed a notation system for detailed transcription (see CONVERSATION ANALYSIS AND TRANSCRIPTION AND DATA) of the collected data. Her system notates features of the interaction, for example, pauses, sublexical words, prosody (see CONVERSATION ANALYSIS AND PROSODY) (e.g., volume, stress, rhythm, pause, etc.), which displays details of talk that are lost in standard orthography. One of the many phenomena Jefferson opened up through her transcriptions of sound as emerging in real time is laughter (see CONVERSATION ANALYSIS AND LAUGHTER). By annotating laughter as it appears, that is, as *hha hha* and *hhe hhe*, the interactional architecture of laughter suddenly became accessible as well as the social work it might be doing. Jefferson's very detailed transcriptions make the wealth of subtle features of talk available for analysis. CA research has shown that these subtle features are demonstrably relevant for the participants themselves and for the ways they make sense of each other.

In CA research practice, data are not necessarily collected with specific research hypotheses in mind. Instead, CA researchers take whatever naturally occurring interactions they are allowed to record, transcribe the data and observe what interesting phenomena emerge out of an unfocused analysis, that is, out of what in CA terms is referred to as "unmotivated looking." Traditionally, this is done in data sessions where CA researchers share observations of the same data fragment. These observations often lead to more detailed studies of the candidate phenomenon to understand the features of productions and its local ecology in talk.

When an interesting candidate phenomenon has been identified, other data are usually mined to find more instances of it. Depending on the frequency of the phenomenon, a collection of instances can cover several hundred cases or just a handful. Any description should explain all the instances found, however, those that do not fit the analysis, that is,

“deviant cases,” are often serious challenges for the research process. Explaining deviant cases can make an analysis more robust since the participants may be seen to orient to the phenomenon *as* deviant. But deviant cases may as well destroy a first analysis and lead the researcher to reanalyze the data.

Dissemination of CA

Since Sacks et al.’s seminal papers, CA has made substantial inroads into a wide range of different scientific fields and has formed research communities in a variety of countries, mainly in the United States, Europe, and parts of Asia. CA emerged in the social science departments of California under the influence of especially Erving Goffman and Harold Garfinkel. Researchers in the United Kingdom and Germany brought CA to Europe where CA initially was practiced in social sciences. Apart from sociology and communication studies, CA researchers are now employed in social sciences, humanities, education, health studies, and technology.

In humanities, linguistics is possibly the field where the largest numbers of CA researchers have been employed outside sociology. In CA, language is described as the bedrock of interaction and this has attracted the interest of language specialists. Interactional linguistics (see CONVERSATION ANALYSIS AND INTERACTIONAL LINGUISTICS) builds on a history of linguistics and pragmatics where CA adds resources to study the interactional role of linguistic elements in much greater detail than previously possible. In the study of language disorders (see CONVERSATION ANALYSIS AND COMMUNICATION DISORDERS) CA-informed research has opened a discussion of social aspects of language disorders. Other fields informed by CA are education (see CONVERSATION ANALYSIS AND EDUCATION) and therapy (see CONVERSATION ANALYSIS AND THERAPY).

In technology, workplace studies (Suchman, 1987; Luff, Hindmarsh, & Heath, 2000) has involved CA in the study of user conduct in complex technological settings—such as control centers, collaborative work such as cockpit communication (see CONVERSATION ANALYSIS AND COCKPIT COMMUNICATION), and medical work—and made CA a relevant research method for user-centered design (see CONVERSATION ANALYSIS AND DESIGN). Technomethodology (Button & Dourish, 1996; Crabtree, 2004) has studied the ways in which humans make sense of technology.

CA provides a method to study the activities in professions and specialized environments including meetings (see CONVERSATION ANALYSIS AND MEETINGS), standardized interviews (see CONVERSATION ANALYSIS AND INTERACTION IN STANDARDIZED SURVEY INTERVIEWS), and interview studies (see CONVERSATION ANALYSIS AND INTERVIEW STUDIES). One of the early areas in CA is the study of emergency calls (see CONVERSATION ANALYSIS AND EMERGENCY CALLS). In those calls, time pressure to get help clashes with the interactional practices of ordinary phone calls, sometimes with disastrous results.

The present encyclopedia presents an (admittedly, incomplete) overview of various fields in which CA has been applied as a methodological approach and has provided professional feedback to “practitioners.” Extending the traditional focus of applied linguistics, that is, first and second language acquisition, CA has entered, to varying degrees, a range of disciplines some of which are presented in this encyclopedia. For other overviews see Drew and Heritage (1993), Richards and Seedhouse (2005) and Arminen (2005). CA has also provided more or less specific guidelines to “practitioners” (Antaki, 2011).

In this encyclopedia, recent CA research in language learning has special relevance. Child language acquisition (see CONVERSATION ANALYSIS AND CHILD LANGUAGE ACQUISITION), which has a long history of ethnographic-informed research, has fostered a number of CA contributions. In second language acquisition (see CONVERSATION ANALYSIS AND SECOND

LANGUAGE ACQUISITION: CA-SLA) research, the dominating paradigm of experimental psycholinguistics has for two decades attempted to integrate interaction into a psycholinguistic model (Long, 1981, 1983; Gass & Varonis, 1985). CA scholars have challenged the distinction between competence and second language use (Firth & Wagner, 1997, 2007) and over the last 15 years have produced a large number of studies on learning in second language interactions. CA studies in SLA have used data from classroom interaction (see CONVERSATION ANALYSIS AND CLASSROOM INTERACTION), from lingua franca (see CONVERSATION ANALYSIS AND LINGUA FRANCA), and from everyday L2 encounters (Gardner & Wagner, 2004; Kurhila, 2006).

A CA take on L2 learning needs to be part of a more general understanding of how learning in interaction (see CONVERSATION ANALYSIS AND LEARNING IN INTERACTION) is organized. Returning to the earlier mentioned paramount distinction between topic and resource, CA is not interested in learning or language acquisition (see CONVERSATION ANALYSIS AND LANGUAGE ACQUISITION) as a topic (or as a result), but in the resources that participants demonstrably deploy for making sense of a certain activity *as* language learning. A number of publications have recently explored CONVERSATION ANALYSIS METHODOLOGY IN SECOND LANGUAGE STUDIES, especially longitudinal studies (e.g., Hellermann, 2008; Nguyen & Kasper, 2009; Hall, Hellermann, & Pekarek Doehler, 2011; Pallotti & Wagner, 2011).

Conversation Analysis Methodology in Second Language Studies

CATHERINE E. BROUWER

Introduction

The use of the concepts and methodology of conversation analysis (CA) for second language (L2) studies has been argued widely (Firth & Wagner, 1997, 2007; Markee, 2000; Kasper, 2006; Kasper & Wagner, 2011). However, when CA and second language acquisition (SLA) are brought together, compromises need to be made and the methodology needs to be made explicit. Hellermann (2006) describes his study as a *microethnographic longitudinal case study, using methods from CA*. Such carefully deployed terminology indicates that there are issues at stake in the ways in which CA is applied to L2 studies.

Types of Studies

Below I describe five different approaches to the analysis of L2 materials. These approaches are categorized on the basis of data type, research objective, and the analytical procedures employed.

Participants' Interactional Methods in L2 Everyday Talk

Interactional methods (or practices) are the systematic ways in which participants organize their interactional conduct. The description of such practices is the prime research objective of a number of CA-SLA studies which build on the results of prior CA studies of "monolingual" conversations and compare them with interactional practices in L2 data. A number of studies investigate, for instance, different types of repair. For example, Brouwer, Rasmussen, and Wagner (2004) describe embedded repair in L2 talk on the basis of Jefferson (1983), and demonstrate how the occurrence of this practice reveals orientations to the identities of one or several parties as L2 speakers. Another group of studies describes practices that have not been documented previously in CA. Theodórsdóttir (2011) presents cases where an L2 user insists on completing a hesitantly produced utterance although her conversation partner, during the production of the turn and before she has finished, already indicates that she has understood. Theodórsdóttir shows how the L2 speaker thereby orients to her identity as an L2 learner. The contribution of this type of work is that it documents members' methods and shows how issues of participants' identities are paramount in the data.

Interactional Methods in Interactions-for-Learning

Interactions-for-learning are organized with the objective of L2 learning, and include classrooms, proficiency interviews, and the like. A number of studies investigate how the activity at hand (the classroom) is constituted through specific interactional methods. Mortensen (2009) describes how students in a classroom make themselves available as

next speakers when the teacher asks a question. This line of research may discuss L2 talk in relation to ordinary conversation and show its institutional characteristics. In other words, research on interactional methods in interactions-for-learning aims at showing how, for example, an L2 classroom, as a site for L2 learning, is organized in terms of interaction. The line between institutional and conversational talk, however, is not drawn beforehand, but rather negotiated in or organized by the talk itself; thus interactions that were planned as casual conversations become institutional. Mori (2002) demonstrates how a small group activity, planned as a casual interaction between native speakers and L2 learners, actually resembles a formal interview. Research on interactions-for-learning points toward the ways in which participants stage their interactions as environments which facilitate L2 learning.

“Re-Specifying” SLA Concepts on the Basis of (L2) Conversations

Firth and Wagner (1997) have argued that applying CA to SLA essentially involves re-specification of learning and cognition. Some studies follow up on this call by addressing concepts in mainstream SLA research and investigating interactional practices which in SLA are considered of central importance. An example of such an interactional practice, “recast,” is treated by Hauser (2005). A recast is an altered repetition of learner-produced utterances by a teacher—a type of repair. This type of repair is said to play a central role in L2 learning (Lyster, 1998; Mackey & Philp, 1998) since it provides L2 learners with corrected versions of what they themselves have said—in other words, recasts do not negotiate meaning, but only form. Hauser discusses how recasts, contrary to the claims and coding practices in SLA, do not necessarily maintain the “meaning” of the learners’ initial utterance. Therefore, recasts may have a different function in interaction than what is claimed in SLA. Hauser thus provides a strong empirical argument in relation to “mainstream” SLA methodological practices.

Longitudinal Studies

In first language (L1) and L2 learning, longitudinal studies are traditionally carried out in order to track how language learners perform over longer stretches of time. A speaker’s performance at occasion A is contrasted with his or her performance at some later occasion B in order to ascertain what has been learned. Such studies do not describe learning “as it happens” in interaction but rather point at how the talk *has* changed. The analysis of interactional longitudinal data can be carried out with CA methodology. The overall research design seems to be inspired by a tradition in L1 and language acquisition research, while the analytic approach is CA.

Analysis of Language-Teaching Materials

Language-teaching materials consist most often of textbooks in which model dialogues are presented in written form. Considering the significance of these materials for the process of language learning, they provide interesting material for interaction analyses. Wong (2001) analyzes telephone openings in a number of English textbooks in order to discuss how they relate to telephone openings in “real life” as extensively described in CA. The issue for this type of work is thus how practices that are to be learned are presented in teaching materials. Mori (2005) takes a specific word (*dooshite* ‘why’) as a point of departure and scrutinizes dialogues and exercises in three textbooks in order to uncover the specifics of the dialogues in which this word is presented to the learner. Mori argues that *dooshite* seemed to be included in order to teach specific grammatical forms, rather than functions.

CA Methodological and Procedural Positions in L2 Studies

CA-SLA publications regularly discuss central methodological issues for CA and whether and how they contrast with mainstream methodologies in SLA. The most prominent of these issues are discussed below.

Naturally Occurring Data

CA studies generally use naturally occurring data, or data from any type of interaction that would have taken place regardless of a researcher recording it. Naturally occurring data can come from mundane everyday interaction, or they can be recorded in institutional (e.g., classrooms) or even carefully arranged encounters (e.g., tests or [survey] interviews). The critical issue is that naturally occurring interactions are not staged for the benefit of the researcher but follow their own agenda. CA-SLA has pointed at the quality of the data for analysis since SLA studies often use elicited data for making claims about interaction (Firth & Wagner, 1997). It is, however, not always clear whether some data may be seen as “instances of interaction for language-learning purposes” or “planned interaction for the sake of data collection.” For example, researchers sometimes ask students to tape their interactions as a part of their language class. In such cases, the status of the data as naturally occurring is questionable, and this should be addressed in the study.

Naturally occurring L2 data may be hard to collect. Some language learners are reluctant to tape themselves or to be taped in situations in which they feel less competent. This may be a reason for researchers just to audio record face-to-face encounters (Theodórsdóttir, 2011), or to turn to institutional data rather than everyday conversations, or even to rely on written materials such as textbooks.

Describing Interactional Methods or Practices

The research objective of CA is to describe members’ interactional methods. This contrasts with the tendency in SLA to focus on language issues. As Firth (1996) states, CA-SLA studies need to address what the interactants are *doing* to a higher degree than what they are *saying*. If one is to follow basic CA principles of taking all the details of the talk into account, one may consider details that the participants seemingly ignore, as Firth shows.

Longitudinal studies that investigate the development of L2 learners’ interactional competence may follow Wootton’s CA study of how a child’s performance of requests changes over several years, thus focusing on the development of one interactional practice (Wootton, 1997). Such studies need to make the case that the tracked participant’s method is the *same* method over time, even though the L2 learner’s performance has *changed*. As Sahlström (2009) suggests, such a claim may best be made by building the analysis on findings in L1 CA studies.

An alternative is represented by Hellermann (2006), who describes changing participation in relation to a sequential position in the interaction, for example after a prompt from a teacher to start a task. The participation may change either by the learner performing different actions over time, or by the learner, as in the Wootton example, performing the same action but in different ways.

Finally, describing how an *individual’s* interactional competence changes over time on the basis of the description of *interactional* practices, which according to classical CA are seen as shaped by all participants who take part in them, may be a contradiction in itself. Following Lave and Wenger (1991), who conceptualize learning or development as changing participation, may solve this problem, but moves the enterprise further away from established CA research.

Unmotivated Looking

The paramount discovery procedure in CA is unmotivated looking. This means that the analyst refrains from imposing categories on the data that are not demonstrably relevant for the participants. In other words, CA starts from making observations about the data, rather than using pre-formulated notions about phenomena that are thought to be in the data. This means that the researcher does not have to search for the appropriate data to fit a research problem. In Sacks's own words:

Recurrently, what stands as a solution to some problem emerges from unmotivated examination of some piece of data, where, had we started out with a specific interest in the problem, it would not have been supposed in the first instance that this piece of data was a resource with which to consider, and come up with a solution for, that particular problem. (1994, p. 27)

Several researchers in CA-SLA have practiced this, and have discovered practices that have not been described in either CA or L2 studies. An overall interest in issues having to do with language learning or participants' identities as L2 users does not necessarily clash with this research strategy, as long as it is not too specific.

As both Kasper (2006) and Schegloff, Koshik, Jacoby, and Olsher (2002) have suggested, however, CA-SLA studies may benefit from applying outcomes from established CA to L2 materials. For example, a researcher may look at how well-described practices in CA, such as greetings, telephone openings and closings, invitations, or repair sequences, are accomplished by L2 users. For some types of research, "unmotivated looking" is not an option. It is, for example, hardly fruitful to scrutinize textbooks for how they present practices without having thorough analyses of such practices available beforehand. Talmy (2009, p. 905) provides a lengthy discussion of an example of how motivated looking at data from an English as a second language (ESL) classroom may reveal what is problematic about the classroom.

Membership Knowledge

Conversation analysts employ "membership knowledge"—knowledge about the everyday practices of the people they study—in their analysis. One could ask how a researcher can use membership knowledge when the analyst is not, necessarily, a "member" of the same community of language users as the informants, for example when a native speaker of English studies Chinese learners of English. Moerman (1996) suggests obtaining membership knowledge by ethnographic observation, and especially in the case of classroom L2 studies, this is a workable option employed by several researchers, such as Mortensen (2009).

Researchers mostly analyze L2 materials in their own L1, for example Mori (2002) studying Japanese as an L2. One reason for examining materials in the analyst's L1 may be that, in Moerman's (1996) words, "Conversation analysis of foreign language materials is difficult" (p. 149). However, analyzing L2 materials may be additionally problematic. As Firth (1996, p. 239) notes, the interactants in the data as well as the researcher do not share a "developed and stable linguistic and interactional competence." This may be more problematic in some cases than others, depending on the command the researcher has of the informants' L1 and additional languages.

Transparency

In contrast to many quantitative studies of SLA which present language data transformed into numbers, CA-SLA claims a higher degree of transparency of the research process by providing transcripts of analyzed sequences and inviting the reader to scrutinize these.

This requires the transcript to be as precise as possible yet understandable for the reader. These requirements may be conflicting. Jefferson (1996) demonstrates some of the challenges of transcribing data produced by L2 speakers. Many L2 speakers have non-native accents, but most CA-SLA researchers do not directly represent these accents in their published transcripts unless they are considered relevant for the analysis. This reduces the opportunity for the reader to examine the analysis. A solution for this has can be seen in the work of Hellermann, who provides the reader with the possibility of watching video clips of the data. However, such a solution might not be possible due to arrangements regarding confidentiality and anonymity.

Conversational Grammar

CHRISTOPH RÜHLEMANN

Introduction

Computerized corpora have facilitated descriptions of the grammar of conversation in unprecedented detail in recent decades. Beside numerous research articles focusing on individual features, two corpus-based grammars have advanced our knowledge of conversational grammar considerably, the *Longman Grammar of Spoken and Written English* (LGSWE, Biber, Johansson, Leech, Conrad, & Finegan, 1999) and the *Cambridge Grammar of English* (Carter & McCarthy, 2006). Particularly revealing are the analyses in the large entry in the LGSWE entitled “The grammar of conversation” (Biber et al., 1999, pp. 1038–125). Given the growing awareness of the relative differentness of conversational grammar from the grammar of Standard English, some scholars argue “the independence of spoken grammar” (McCarthy, 2001, p. 128) while others assert “the underlying *sameness* of spoken and written grammar” (Leech, 2000, p. 687).

The aim of this entry is to give a brief account of conversational grammar and to outline how its forms can be understood functionally. In so doing I will draw on the situational framework developed in Rühlemann (2007). The last section will present a case study on situational ellipsis. All examples used for illustration are taken from the conversational subcorpus of the British National Corpus (BNC, 2001), a general corpus of roughly 100 million words of British English collected in the 1990s (see Hoffmann, Evert, Smith, Lee, & Berglund Prytz, 2008).

What Is Conversational Grammar?

Following the authors of the LGSWE, I will use the term “conversational grammar” as referring to “grammatical features that are especially characteristic of conversational language, as compared with other registers” (Biber et al., 1999, p. 1038). That is, for a feature to be part of conversational grammar it is required that it either occur virtually only in conversation or be characteristically more frequent in conversation than in other major registers. A feature that is virtually nonexistent in writing but widespread in casual talk is *I says*, a form used in reports of conversations with multiple turns (see Rühlemann, 2007); a related phenomenon is quotative *I goes*, (see Rühlemann, 2008). Consider:

- (1) Cos **he says**, **Steve says** to me, is he in? **I says**, no. **He says**, he’s not in? **I says**, no. And a bit later on **I says** to him . . . I think he’s at Cadets. **He says**, he’s not, he’s in. **I says**, eh? **He says**, he’s in. And he’s just walked past me. **I says**, well you could of told me he were in. **He says**, he’s gone and done summat.

An example of an item which does occur in writing but is, in relative terms, much more common and more “key” in conversation is the first-person pronoun *I*: it is by far the most frequent word and the second most significant key word in the conversational subcorpus of the BNC (following the contracted form *yeah*) (on the nature and analysis of key words, see Scott, 1997).

Since conversational grammar is so intimately linked to register it will be necessary to characterize the notion of register in some more detail.

What Are Registers?

Registers are defined by Biber et al. as “situationally defined varieties” (1999, p. 5). This definition grasps two key components of register: variation and situation.

Registers are social varieties, such as sermons, sports commentaries, academic writing, news reportage, and conversation, to name a few. What distinguishes them? First, they are distinguishable on the basis of the circumstances—or, in Hallidayan terminology, “type of situation” (Halliday, 1978, p. 29)—in which they are typically produced. The circumstances, for example, under which a sports commentator breathlessly reports on the rapidly changing scenes on the pitch are fundamentally different from the circumstances under which a poet produces maybe a two-liner in which every syllable is measured and weighed and every possible overtone is mulled over countless times. Not surprisingly, the circumstances in which language is used impact on *how* language is used: because the situation types are different, the language arising from them will be different too. The notion of register, then, requires a double perspective: an extralinguistic perspective, in which registers are intimately associated with certain situation types, and a linguistic perspective, in which registers are distinguishable on the basis of the linguistic features distinctive of them (see Crystal, 2003, p. 290).

This Janus-face of registers is crucial for describing them: “Any account of language that fails to build in the situation as an essential ingredient is likely to be artificial and unrewarding” (Halliday, 1978, pp. 28–9). How can the relationship between language and situation be described? In addressing this question the notion of adaptation is helpful: the linguistic variation characteristic of a register results from the language users *adapting* their language to constraints set by the particular situation. In the case of conversation, then, conversational grammar can be seen as adapted to the constraints set by the conversational situation. That is, the forms that are characteristic of conversational language are functional with regard to the factors that characterize the conversational situation. If one accepts this premise, the question arises as to what type of situation gives rise to conversation. In what follows I will address this question and give illustrative examples of conversational grammar.

Conversational Situation and Linguistic Adaptation

The question of what determines the conversational situation has attracted some attention in recent research (e.g., Biber et al., 1999; Leech, 2000). Probably the most comprehensive account to date is Rühlemann (2007). He outlines five situational factors for conversation: “shared context,” “co-construction,” “real-time processing,” “discourse management,” and “relation management.” They are briefly explained in what follows.

Shared context refers to the wealth of nonverbal, perceptual, social, and cultural context that conversationalists share with each other. Because conversationalists interact face to face, they can convey subtle meanings nonverbally, using facial expressions and gestures. Conversationalists share access to visual, auditory, or tactile stimuli; there is no need to spell out every reference; often pronouns such as *that* or *he* will suffice for the hearer to recognize the intended referent. Further, conversationalists typically know each other well; thus, they share a wealth of experiences (what they went through) and discourses (what they talked about). As a result, linguistic “shortcuts” such as minute hints, unfinished sentences, pronominal usage “out of the blue”—unintelligible for outsiders—are easily understood. Also, conversationalists tend to underspecify reference and use vague language

instead, relying on their partners to fill in the gaps (e.g., O'Keeffe, 2004). In (2), for example, the set marker *or something* (Stenström, Andersen, & Hasund, 2002) is used not only to index the speaker's uncertainty about the intended reference but also to activate in the listener's mind the category "fruit," which, in its breadth, is more likely to be referentially correct than the narrower reference to "grapefruit."

- (2) No she, she had a grapefruit **or something** didn't she?

Co-construction reflects the fact that conversational text is the outcome of joint construction, through sequential organization (Sacks, Schegloff, & Jefferson, 1974) and role rotation (Goffman, 1981). Unlike lectures or academic presentations, which allow for speaker change only in question-and-answer sessions, the organization of turn taking in conversation provides for constant, rapid speaker change and the concomitant rotation of participant roles. Participants slip in and out of three major roles: speaker (the one holding the floor), recipient (the one/s whom the speaker is addressing) and listener (the one/s supporting the speaker in the backchannel but not claiming the floor; see, for example, Wong and Peters, 2007). Because of this inherent coauthorship in conversation participants can with great ease co-construct single utterances, and respond coherently and with "no gap/no overlap" (Sacks et al., 1974) to utterances, however elaborated, fragmented or elliptical. Speakers use a wide range of techniques to encourage co-construction. Examples of verbal next-speaker selection techniques include use of vocatives (e.g., McCarthy & O'Keeffe, 2003) and question tags (e.g., Tottie & Hoffmann, 2006); nonverbal techniques make use of gaze, intonation, and other bodily cues.

Real-time processing captures the fact that in conversation an essential resource—available in abundance in most writing—is scarce: time. Unlike writers, who can retrace, change, delete, and substitute any words, speakers cannot take back anything they have said. Unlike readers, who can reread passages at their leisure, listeners must understand speech immediately and be able to coherently respond in a split second. Further, what speakers are going to say and how they are going to put it is not premeditated in conversation: speakers plan ahead as they speak. Because time for planning and processing speech is scarce, the principle of economy looms large in conversation: "If one can shorten the text while keeping the message unimpaired, this reduces the amount of time and effort involved both in encoding and in decoding" (Leech, 1983, p. 67). The forms favored by the economy principle include, at the phonological level, all types of contraction: negative contraction such as *n't*, verbal contraction such as use of *'s* both for *is*, *has*, and *does*, and conversational contractions such as *gonna*, *gotta*, *dunno*, *cos*, etc. Syntactically, the economy principle favors types of "generalization" (Rühlemann, 2007), that is, use of single forms fulfilling multiple functions. The effect of generalization is a reduction of production load: instead of using two (or more) distinct forms, which is more costly to process, a single *uni*-form is used. Examples include the invariant tag *innit*, as in (3), use of *BE like* to report not only speech, as in (4), but also thought, emotion, and gesture (Buchstaller, 2002), and the pattern "*there's* + plural NP," as in (5):

- (3) So that'll be over a hundred and forty pound **innit**?
 (4) **I'm like** oh come on Carla hurry up
 (5) Well in many ways yes, they, **there's** powered **roads**, there's electricity and even water on tap, they never had

The construction in (5) has been shown to be more frequent in conversation than the plural verb–plural NP construction (see Biber et al. 1999, p. 186). Carter (1999, p. 157) argues that *there's* + plural NP is "used standardly in spoken English irrespective of whether the following subject is singular or plural."

Another notably economic construction is the header construction.

(6) **This little shop** . . . [it]’s lovely.

Headers involve an NP preceding the core of the clause (*This little shop* in the example), with a co-referential pronoun inside the clause (*it*). They benefit both the speaker, who “separates out crucial bits of information which are then attached more loosely to the clause” (Biber et al., 1999, p. 957), and the recipient, who receives an early statement of the upcoming topic.

Discourse management arises from a convergence of real-time processing and co-construction: because speakers in conversation interact in real time, fully exposed to all sorts of planning and processing constraints, and, at the same time, need to be able to co-construct conversation coherently, an interactional dynamism is created, which is probably unparalleled in other registers. This dynamism demands attention: if unattended, conversation might collapse into disorder and incoherence. The crucial task is, then, for conversationalists to “manage” the dynamism in such a way as to establish discourse coherence. This is achieved by adherence to the “processibility principle” (Leech, 1983). This principle “recommends that the text should be presented in a manner which makes it easy for the hearer to decode in time” (Leech, 1983, p. 64). A broad variety of language features serve the processibility principle; they include most notably discourse markers (e.g., Schifffrin, 1987), the “maxim of end-weight” (Leech, 1983, p. 65), which demands that complex constituents be right-branched rather than left-branched, and “turn markers” such as *he says/goes/s like* and *I went/said/m like*, which help listeners tell apart the different “voices” that narrators may enact in storytelling.

Relation management, finally, pertains to the interpersonal goal-orientation in conversation: to do conversation is essentially to “establish bonds of communion” (Malinowski, 1923). Prime examples of “bonding language” are certain types of vocatives, including familiarized forms such as *Mike* or *Mikey* for *Michael*, endearments such as *love* or *sweetheart*, as well as the rich variety of pet names used for loved ones (see Leech, 1999; McCarthy & O’Keeffe, 2003). The interpersonal orientation in conversation is also realized by use of evaluative language. Examples include the tail construction, as in (7). Tails involve extraposed noun phrases (*this smog*, in the example below). They commonly co-occur with strongly evaluative language and, thus, predominantly perform a “phatic function” (Aijmer, 1989).

(7) Terrible **this smog** innit?

Evaluative language also includes “affect adjectives” such as *good* or *lovely*, “affect verbs” such as *WANT* or *LOVE*, and the broad class of interjections which “have an exclamatory function, expressive of the speaker’s emotion” (Biber et al., 1999, p. 1083). Speakers in conversation also use a broad variety of means to involve listeners in the discourse. Examples, particularly in conversational storytelling, are use of historic present (HP), direct speech reporting (including forms of mimicry) instead of the more detached indirect reports, and “introductory this” as in (8), a use of the proximal demonstrative which serves to quickly involve the listeners in the story, inviting their active cooperation in building up a mental image of the situation being depicted (Biber et al., 1999, p. 274).

(8) And we got **this** mad bloke come in!

In the remainder of this entry I will pick out one conversational grammar feature—situational ellipsis—as a case in point, characterizing it in more detail.

A Case in Point: Situational Ellipsis

Quirk, Greenbaum, Leech, & Svartvik (1985) distinguish three types of ellipsis: textual, where the full form is recoverable from the neighboring cotext; structural, where the ellipted form is retrievable through knowledge of grammatical structure; and situational, where the “missing” element can be recovered via recourse to extralinguistic context. The three types are illustrated in (9)–(11) (ellipted forms in square brackets):

- (9) textual: (. . .) if you want me to [**lift the edge of your carpet**] I'll, I can lift the edge of your carpet and put it down onto the floor
- (10) structural: (. . .) he's telling me the other week, he's, he's still five thousand pounds owing to him, though, work [**that**] he did twelve months ago
- (11) situational: [**I**] Couldn't see any sign of nervousness myself (. . .)

Crucially, situational ellipsis tends to be utterance-initial, taking the form of “omission of subject and/or operator” (Quirk et al., 1985, p. 896). The following examples illustrate these structural possibilities. While only the subject is ellipted in (12)–(14), both subject and operator are not encoded in (15)–(17). The only example of operator-only ellipsis is (18):

- (12) [**I**] Wouldn't mind.
- (13) PS02B: What babe?
PS02F: [**I**] Don't want these black-currant sweetsies.
PS02B: Why babe?
PS029: [**You**] Don't like them?
- (14) [**It**] Depends how long it takes me.
- (15) [**Do you**] See what I mean about that skirt?
- (16) [**Have you**] Got that letter?
- (17) [**Is there**] Anybody else with a comment?
- (18) [**Does**] Anyone want a cup of tea?

As illustrated in the examples, situational ellipsis overlaps to a large extent with “subject ellipsis” (Nariyama, 2004). Omitting the subject is unproblematic in so-called pro-drop languages (e.g., Italian and Spanish) where the subject is morphologically shown by the verbal inflection. For example, the subject of the Italian utterance *ti voglio bene* (“I like you”) is unmistakably the speaker because the verb form *voglio* can only be used for first-person singular. This type of subject–verb agreement, however, is largely absent from English (except for third-person singular present tense). The problem, then, is how listeners can ascertain the ellipted referent.

The answer lies in the context, which, in its multiple facets, is shared by conversationalists. Relevance theory, developed by Sperber and Wilson (1995), is helpful in elucidating the ways that listeners go about exploiting the shared context. Participants look for an interpretation that makes the utterance relevant in the expected way, thereby following a path of least effort. That is, listeners test the most accessible interpretation first and move on to the second, third . . . most accessible interpretation only if the first, second . . . does not yield satisfactory implications. In the case of ellipted third-person referents, the most accessible interpretations will be those derived from the linguistic cotext. In (14), for example, the omitted subject is the dummy subject *it*, the most conventional “filler” for

the ellipsis. In (17) and (18), relevant interpretations are arrived at by filling in forms that are structurally suggested by the cotext. In most cases, however, situational ellipsis is centered on first and second person (see Nariyama, 2004, p. 258), as in (11)–(13) and (15)–(16). Here, then, the type of context exploited is the extralinguistic context. The pronouns *I* and *you* are core person deictics by which speakers refer to themselves and their interlocutor(s) respectively. In face-to-face conversation, both addresser and addressee are physically copresent. When references to them are “left out,” listeners need not venture far to recover the referents: in questions, the most accessible referents are the listeners themselves; in statements, the most likely referents are the speakers (Nariyama, 2004). Thus, relevance and recoverability are ensured by physical copresence.

In sum, what may be felt as “missing” in the use of situational ellipsis, if looked at from a written perspective, is made highly predictable by linguistic and extralinguistic context. As McCarthy (2001, p. 56) puts it: “Nothing is missing since the subject is there in front of the listener or is simply obvious and/or current/salient in the context.”

Conclusions

It is still early days for descriptions of conversational grammar. As future corpora of conversation become larger and even more successful in their struggles to faithfully represent the myriads of conversations going on every day in the English-speaking world, many details of present-day descriptions of conversational grammar may have to be modified and, possibly, interpreted in a different light. The attempt, however, to view conversational grammar as the flip side of the conversational situation and to try to understand how, by using conversational grammar, speakers attempt to come to terms with the constraints set by the situation is a promising one. It helps us appreciate the value of conversational grammar, which lies in its adaptedness. The implications particularly for English-language teaching cannot be overstated. If conversational grammar can no longer be brushed aside as simply nonstandard, it can no longer be designated as a no-go area for language learners. Rather, knowing what makes the language of conversation unique and functional may enable us to actually teach it to our students.

Conversational Implicature

MICHAEL HAUGH

Speakers are often assumed to mean more than the literal sense of the words that they have spoken. For example, if I am in a café with a friend who is eating some cake with her coffee, and I comment that the cake looks really nice, my friend might respond by offering me some of her cake. By making this offer, my friend has shown that she thinks I was implying that I would like to try some of her cake. Since I did not actually say I wanted to try her cake, I could deny that I meant to imply this, either directly by saying something like “Oh, I didn’t mean I want to try it” or indirectly by saying something like “Oh, I’m not hungry at the moment.” However, unless I make some sort of denial, then, what has been implied, in part due to my friend’s response, is that I would like to try her cake. In lay terms this is considered a *hint* or *implication* that has arisen from what I have just said.

Paul Grice, a prominent philosopher of language, introduced the concept of conversational implicature to encompass such meanings in the 1967 William James lectures more than forty years ago. He developed a theory of conversational implicature as part of his broader theory of speaker-intended meaning, contrasting it with the notion of “what is said” (Grice, 1989). Conversational implicatures were divided into two main types by Grice: *particularized* conversational implicatures and *generalized* conversational implicatures. The basic difference between particularized and generalized conversational implicatures is that the former require specific contextual information to arise, while the latter are meant unless something in the context (including the utterance itself) blocks them.

Returning to the above “cake” example, for instance, in saying that I think that my friend’s cake looks nice, a particularized conversational implicature (namely that I would like to try my friend’s cake) potentially arises. If my friend responds in turn with something like “Would you like some?” then not only does she show that she has drawn this particularized conversational implicature, but a generalized conversational implicature also arises from her saying “some cake,” namely, “[but] not all of it.” This latter implicature could be canceled, for example, by her saying something like “in fact why don’t you have it all?” and so is clearly not part of what is said. However, in most contexts it would arise unless explicitly canceled, and thus it counts as a generalized implicature.

In outlining his theory of conversational implicature, Grice made three key claims, each of which has subsequently become the subject of considerable debate in pragmatics. First, Grice claimed that the inferences underlying conversational implicatures are made in a principled way. He formalized this claim in the postulation of an overarching cooperative principle, formulated as “Make your conversational contribution such as is required, at the stage at which it occurs, by the accepted purpose or direction of the talk exchange in which you are engaged” (Grice, 1989, p. 26), and through its elaboration in the four related conversational maxims.

The maxim of *quality*

Try to make your contribution one that is true, and specifically:

- Do not say what you believe to be false.
- Do not say that for which you lack adequate evidence.

2 CONVERSATIONAL IMPLICATURE

The maxim of *quantity*

- Make your contribution as informative as is required for the current purposes of the exchange.
- Do not make your contribution more informative than is required.

The maxim of *relevance*

Make your contribution relevant.

The maxim of *manner*

Be perspicuous, and specifically:

- Avoid obscurity.
- Avoid ambiguity.
- Be brief.
- Be orderly.

In positing the cooperative principle and conversational maxims, however, Grice did not mean to say that communication is always cooperative—a view that is sometimes mistakenly attributed to him—as the cooperative principle applies even in situations where people are arguing (Grice, 1989, p. 369). Instead, Grice claimed that speakers generate conversational implicatures by either invoking or flouting one or more of the conversational maxims in light of a general assumption that speakers are always adhering to the cooperative principle. In other words, instances where the speaker's utterance can only be treated as consistent with a particular conversational maxim and the cooperative principle (invoking), or just the cooperative principle (flouting), if the speaker is understood to be implicating (a technical term for *implying*) something beyond what he or she has said.

Grice's second key claim was that conversational implicatures arise from inferences that are defeasible, and thus (theoretically at least) they can always be canceled. He argued that a conversational implicature can be canceled in two ways. *Explicit cancellation* involves adding a subsequent clause (for example, "I didn't mean [to imply x]") to retract the implicature, or alternatively block the implicature from arising in the first place. *Contextual cancellation* involves finding situations in which the potential implicature would not arise (Grice, 1989, p. 44). These two types of cancellation are of a different order of language description, however, as Jaszczolt (2009) points out, with only the former being of relevance to those analyzing implicatures in discourse.

Grice's third key claim was that conversational implicatures can be generated through either once-off reasoning in a particular context (nonce inferencing), or regularized or conventionalized reasoning across contexts (default inferencing). According to Grice, particularized conversational implicatures are generated through ordinary reasoning (as opposed to strict logical reasoning) about a speaker's intentions, drawing from what has been said by the speaker in a specific context as well as the cooperative principle and conversational maxims. Generalized conversational implicatures, on the other hand, are induced through default reasoning about a speaker's intentions, drawing from what has been said in conjunction with the cooperative principle and conversational maxims in the absence of a marked context.

One problem with the cooperative principle and conversational maxims framework, however, is that it is not actually rigorous enough to account for the conversational implicatures it supposedly generates. Davis (1998), for instance, argues that the maxims can be used to generate implicatures which do not actually occur in conversation, concluding that the maxims generate erroneous predictions as readily as they generate correct ones. For example, the meaning of an idiom such as *spill the beans* can be worked out using Gricean principles (Sadock, 1978), but it does not seem reasonable to suggest that hearers actually use these principles in deriving the meaning of such idioms. Instead, it is more likely that

some kind of conventionalized route is involved, as argued by Wierzbicka (1985) in regard to implicature conventions more generally.

The development of a more formally rigorous and empirically grounded set of conversational maxims has occupied neo-Griceans, a group of scholars who have retained the fundamental assumptions of Grice's theory of conversational implicature in their work since the 1980s. Of particular note is the work of Horn (1984, 2004) and Levinson (2000) who have developed alternative theories of generalized conversational implicature in which Grice's maxims have been refined or even reformulated. Horn (1984) proposes a dual distinction between the principles of quantity and relation, while Levinson (2000) develops a tripartite distinction between the principles of quantity, informativeness, and manner. "Scalar implicatures," for instance, a particular type of generalized conversational implicature, arise by default from the use of a weaker term on a quantity implicational scale according to neo-Griceans.

One key challenge to the notion of generalized conversational implicature, however, is that not only Gricean principles, but also the refined neo-Gricean principles, arguably overgenerate implicatures that do not actually arise in interactions. For example, according to the quantity scale *<all, most, many, some>*, "some" is generally understood to imply "not all." Thus, a standard (neo-)Gricean account would predict that by saying "Some of them do" in response to A asking "Which of your colleagues support the strike?" B is implicating "Not all of them do." Yet in reality, something like "I don't want to [or can't] say who supports the strike" is more likely to be implied (Carston, 1998). A theory of generalized conversational implicature must therefore include a systematic account of when these default inferences are blocked if it is to constitute a viable category of implicature. This is not to say that default inferences do not underpin implicatures in many instances, but rather that considerable work remains to be done to further our understanding of these kinds of implicature.

A second problem with the Gricean theory of conversational implicature is that the cooperative principle and conversational maxims may be unnecessary altogether. Relevance theorists, for instance, have argued that these should be abandoned in favor of the principle of relevance, that is, the assumption that "every act of ostensive communication conveys a presumption of its own optimal relevance" (Sperber & Wilson, 1995, p. 260), where relevance is defined as a balance between "positive cognitive effects" and "processing effort" (Sperber & Wilson, 1995, pp. 265–6). The basic idea is that hearers interpret the speaker's intended meaning(s) through inferential processes guided by calculations of relevance. A (conversational) implicature is redefined in relevance theory as a "communicated assumption which is derived solely via processes of pragmatic inference" (Carston, 2002, p. 377). The scope of relevance-theoretic implicature can thus be considered to be largely synonymous with that of particularized conversational implicatures. The (neo-)Gricean distinction between generalized and particularized conversational implicatures is not accepted by relevance theorists, who argue instead that such meanings are better treated as part of the explicature of an utterance.

The relevance-theoretic account of implicature also faces challenges, however. One issue is that "positive cognitive effects" are not yet well characterized, and thus relevance theorists can arguably only offer intuitive rather than formal accounts of the generation of implicatures. A second problem is that the distinction between implicatures and explicatures is not as clear-cut as might first appear (Haugh, 2002). While Carston (2002) argues that the distinction relates only to the derivational process underlying communicated assumptions, such a view cannot account for the ways in which implicatures can give rise to politeness (or impoliteness), express humor, and index particular identities or power relationships.

More recently, it has been argued that particularized conversational implicatures can be shown to arise from situated inferences without recourse to the cooperative principle or conversational maxims, or indeed even the speaker's intentions (Marmaridou, 2000; Gauker, 2001; Haugh, 2007, 2008b). It has also been claimed that implicatures are not necessarily always cancelable, and thus situations that generate diverging understandings of what has been implied are not always straightforwardly resolved (Haugh, 2008a). The focus has thus shifted in sociopragmatic approaches to implicature to the interactional and relational effects of their usage in discourse.

The notion of conversational implicature has been adopted more widely in other related fields, including the field of second language learning and teaching. In seminal work on the comprehension of implicatures by second language speakers of English, for instance, Bouton (1988) found that the interpretation of implicatures varied according to their L1 background and nationality. Further work on the comprehension of conversational implicatures by learners of varying proficiency levels has found that while L2 proficiency has a significant effect on accuracy in the comprehension of conversational implicatures, there is a less clear-cut relationship between comprehension speed and L2 proficiency (Taguchi, 2005). Other work has investigated whether L2 learners can be taught to better understand conversational implicatures, with some arguing that explicit instruction is helpful (Kubota, 1995), while others take a more equivocal position, suggesting that it is only effective in the case of teaching more formulaic conversational implicatures (Bouton, 1994). A recent study indicates that L2 speakers of English tend to derive scalar implicatures not only more often than L1 speakers of English, but also more often than they would in their own L1 (Slabakova, 2010). It appears, then, that L2 speakers are not necessarily aware of what contextual factors may block scalar implicatures. The fact that once something has been implied it cannot necessarily be retracted, however, underscores the importance for second language learners to acquire a better understanding of implicatures in their L2.

Applied linguists who carry out research into second language learning and teaching have generally taken a much less critical view of Grice's theory of conversational implicature, however, compared to those in the originating field of pragmatics, where aspects of Grice's theory have been the subject of considerable debate over the past thirty years. Thus, while investigating the comprehension and production of implicatures by second language learners (and various methods of teaching this) is indeed a worthwhile endeavor, more in-depth consideration of the various debates surrounding Grice's theory of conversational implicature, and the alternative theories of implicature that have been offered in its place, is arguably necessary in order to better contextualize the findings of such studies. Teaching strategies for understanding implicatures that draw from Grice's theory of conversational implicature, for instance, are not necessarily going to be effective simply because they are likely to be difficult to apply in practice for learners.

Grice made an enormous contribution to our understanding of language use through his theory of conversational implicature. However, his theory has often been (mis)interpreted as a theory of communication, when it is arguably first and foremost a part of a theory of speaker (or utterer) meaning (Arundale, 2008; Davis, 1998). This misinterpretation is perhaps due in part to the relatively sketchy nature of many of Grice's proposals and also to the incomplete publication of his research program during the 1970s and 1980s. In introducing the notion of conversational implicature Grice was intent on explicating how speakers can mean things beyond the literal sense of the words that they have spoken, not on explaining the communicative process *per se*. Recognizing this important distinction, between speaker meaning and communication, is crucial if we are to appreciate the seminal contribution Grice made to linguistic pragmatics, and applied linguistics more broadly, through his theory of conversational implicature. At the same time, it is important to recognize the limitations of his framework in regards to furthering our understanding

of the place of implicatures in communicating, whether it be in a first or second language. A number of alternative approaches to theorizing implicatures have been developed that offer various ways forward, including those developed by neo-Griceans, relevance theorists, and more recently by those working in various sociointeractional frameworks.

Implicatures are arguably important not only because they can give rise to politeness (or impoliteness), but because they can be used to avoid taking sole responsibility for what is communicated and to reach tacit understandings with others, as well as to express humor, and to index particular identities or power relationships. A comprehensive theory of implicature needs to account for all of the interactional and relational effects that can arise when we imply something rather than saying it directly. While conversational implicatures have traditionally been the focus of researchers in the so-called Anglo-American tradition of pragmatics (or cognitive-philosophical pragmatics), there is also considerable scope for greater attention to be paid to implicatures by those working from a European sociocultural-interactional perspective. In this way, we can move beyond a narrow view of regarding conversational implicature as simply a linguistic phenomenon.

Cook, Vivian

BENEDETTA BASSETTI

Vivian James Cook (born June 13, 1940) is an English applied linguist who investigates second language acquisition, and especially multicompetence. He holds a Chair in Applied Linguistics at Newcastle University, UK.

Professor Cook is an active researcher and theorizer and a popular writer, whose past and present work covers first language acquisition, second language acquisition, second language teaching, linguistics, English as a foreign language, writing systems, and bilingual cognition. He is currently chiefly noted for his work on second language acquisition, in particular his concept of multicompetence. He is a prolific author, who has published more than 20 books and more than a hundred journal articles and book chapters. He is a writer of textbooks—on linguistics, first and second language acquisition, language teaching, English as a foreign language, and the English writing system—and of popular books. He is an enthusiastic initiator, with a flair for pioneering new areas of research and for promoting communication across discipline boundaries. He founded (1989) and was first President of (1991) the European Second Language Association (EUROSLA), whose annual conference, held since 1991 in different countries, is arguably the most prestigious meeting for nonpedagogically oriented second language researchers in Europe. In 1993 he was a member of the founding committee of MATSDA (Materials Development Association), a group of interested parties working for the development of high-quality language teaching materials. In 2009 he cofounded the journal *Writing Systems Research*. Over the past 20 years, he has helped the emergence of new research areas, from the effects of second languages on first languages, to second language writing systems, to bilingual cognition, by organizing workshops and editing volumes, as well as through his own research. In the past decade, his work has focused on developing the multicompetence approach to second language acquisition, on writing systems, and on bilingual cognition.

Cook's first jobs were as a Lecturer in English as a Foreign Language at Ealing Technical College (now Thames Valley University) and as Director of the Language Service at the North East London Polytechnic (now University of East London). During this period, he authored or coauthored several coursebooks of English as a foreign language, including the tape-based *Active Intonation* (Cook, 1968), the audio-lingual drill-and-dialogue-based course *Realistic English* (Abbs, Cook, & Underwood, 1968–70), *English Topics* (Cook, 1975a), which was based on his concept of the topic syllabus, the communicative-based *Using Intonation* (Cook, 1979a), and *English for Life* (Cook, 1980–1983), which was based upon the idea of patterned conversational interaction. His English coursebooks have been widely used all over the world.

Vivian Cook has been researching language acquisition since the early days of his career. In the 1960s and 1970s his publications dealt with both first and second language acquisition and the relationship between the two. In 1978 he became a lecturer in applied linguistics at the University of Essex, where he taught first and second language acquisition and language teaching methodology. His interests then shifted more towards second language acquisition and second language teaching.

From the 1970s to the 1980s Cook was a pioneer in the use of second language acquisition research techniques such as elicited imitation (Cook, 1973), short-term memory measures

(Cook, 1977), microartificial languages (Cook, 1988), and computerized response time measurement of comprehension (Cook, 1990) and of grammaticality judgment tasks (Cook, 1994). Believing that the key to language teaching was to understand how people learn languages, he embarked on a lifelong enterprise of bringing together linguistics and second language research with language teaching. He played a major role in popularizing Chomsky's theories, and explored various ways in which universal grammar could be useful for second language acquisition research and language teaching.

He continued to publish on language teaching, from materials development to syllabus design. In the 1980s he was active in developing CALL (computer-assisted language learning) programs for English teaching using BASIC and PROLOG. He argued that the main asset of the computer was its unique ability to handle language through parsing and interactive dialogues, and he therefore concentrated on syntactic parsing programs, computer adventure games, and mock interviews, which he presented in several publications.

Since 1991, Vivian Cook has been developing an approach to second language acquisition known as multicompetence. Multicompetence is "the knowledge of two languages in one mind" (Cook, 2007, p. 17). The main tenet is that the mind of someone who knows more than one language is different from the mind of a monolingual. Anyone who uses one or more languages in addition to the one they first learnt as a child is then an *L2 user* (pronounced *L two user* to avoid the negative connotations of the word "second"), a label used to differentiate those who have knowledge of more than one language from those in the process of learning another language (*L2 learners*). Second language users are not only quantitatively different from monolinguals (in the number of languages known, or in the level of knowledge of their languages), they are also qualitatively different, because knowledge of more than one language affects all the linguistic systems in the L2 user's mind (see Cook, 2002). Knowing a second language affects the first; this is not a symptom of attrition, but of a restructuring language system (see Cook, 2003). Effects can be found in all language modalities (i.e., in reading and spelling, as well as in speaking), and even in nonlinguistic cognition. Given these qualitative differences, L2 learners and users should not be compared with native speakers, but rather with successful L2 users. Most importantly, since multicompetence is a potential achievement for all human beings, researchers in all fields should bear in mind that monolinguals are not representative of what human beings can achieve. The idea of multicompetence has been applied to various fields, from the bimodal bilingualism of deaf people to Native American languages.

A leitmotiv of Cook's work has been his constant interest in language teaching. He has always aimed at relating language teaching practice to second language research findings, and has written various articles about the implications of universal grammar for language teaching and for multicompetence. Within the multicompetence approach, learners can use their first language in the L2 classroom, L2 teachers need not be native speakers of the language they are teaching, and the purpose of L2 learning is to become a multicompetent user of more than one language rather than imitating a native speaker of a second language. Based on his work on the English writing system, Cook argued that second language teachers and textbooks should pay more attention to teaching written language in its own right, rather than using it as a representation of spoken language. Based on his work on bilingual cognition, he argued that second language teaching and learning can change the way people think.

In the early years of the new millennium, Vivian Cook began researching writing systems. In 2004 he published *The English Writing System* (Cook, 2004b) which introduced English orthography to students, covering the linguistics of English orthography and its acquisition by children and second language learners. In the same year he organized the first workshop on second language writing systems (with Benedetta Bassetti), and in the following year coedited *Second Language Writing Systems* (Cook & Bassetti, 2005). This was

the first volume to deal with the acquisition and use of a writing system in a second language. In 2009 he founded the journal *Writing Systems Research* with Jyotsna Vaid and Benedetta Bassetti, with the aim of publishing interdisciplinary and international research on all aspects of writing systems.

Professor Cook has always been interested in the connections between second languages and the psychological processes of language. He has favored an experimental approach to second language research (e.g., *Experimental Approaches to Second Language Learning*, 1986), and conducted experiments on the comprehension of relative clauses (Cook, 1975b), on aspects of short-term memory (Cook, 1977), and on the psychological reality of adjacency pairs (Cook, 1981); in 1997 he published a widely quoted survey paper on “The consequences of bilingualism for cognitive processing.” In recent years he has been looking at the relationship between linguistic relativity and bilingual cognition. Since linguistic relativity research shows differences in nonlinguistic cognition among speakers of different languages, knowledge of more than one language might affect nonlinguistic cognition. In 2002 he organized a panel on the topic of “Bilingual cognition” at the 12th EUROSIA conference, where he and his students presented research investigating the relationship between linguistic relativity and nonlinguistic cognition in bilinguals. His coedited volume *Language and Bilingual Cognition* (Cook & Bassetti, 2011) brought together more than 30 scholars working in different disciplines and countries to showcase research on bilingual cognition, its theoretical background, and its practical implications.

The volumes edited in the past two decades show Vivian Cook’s continuous interest in bringing together researchers working on language across different disciplines and fields, such as linguistics, psychology, and education.

An important aspect of Professor’s Cook production, and indicative of his personality, is his role in popularizing linguistics and second language research by authoring textbooks for postgraduate students and popular books. His accessible and entertaining style, characterized by a spoken-language quality and by unusual and memorable examples, coupled with his encyclopedic knowledge, make his textbooks and popular books very successful.

His coauthored introduction to Chomsky’s syntactic theories, *Chomsky’s Universal Grammar: An Introduction* (first published in 1988) proved popular with students of linguistics. It is now in its third edition (Cook & Newson, 2007), and it has been translated into Chinese, Italian, Japanese, and Korean. His book *Young Children and Language* (Cook, 1979b) aimed to inform playgroup workers about children’s acquisition of language in nonacademic language. Other successful textbooks introduced students to the acquisition, learning, and teaching of a second language. *Second Language Learning and Language Teaching* (first published in 1991) now in its fourth edition (Cook, 2008) and translated into Chinese and Japanese, has become more multicompetence-oriented with each new edition. *Linguistics and Second Language Acquisition* (1993) covered a breadth of areas of linguistics (rather than simply syntax), and is still used as a textbook in postgraduate courses in applied linguistics and language teaching.

Professor Cook has also authored two popular books that aim at introducing serious linguistics to the general public while entertaining them. *Accommodating Broccoli in the Cemetery: Or Why Can’t Anybody Spell?* (2004a) managed to convey linguistically sound views of English orthography to the general public. The book was very well received, and an American edition was published the following year. In *It’s All in a Word: History, Meaning and the Sheer Joy of Words* (2009), Cook presented the lay reader with amusing but linguistically informative facts and arguments about the nature of vocabulary and its acquisition and use.

Vivian Cook has given talks all over the world, from the Far East (China, Japan, Korea, Malaysia, Singapore) to the Middle East (Gaza, Iran, Israel) to the American continent (Argentina, Canada, Chile, the USA), as well as most, if not all, European countries. He is

a devoted teacher and supervisor, and his former students can be found in universities around the world. Regular updates about his publications and teaching can be found on his website <http://homepage.ntlworld.com/vivian.c/Vivian%20Cook.htm>, which also provides an extensive bibliography of second language acquisition research.

Core Vocabulary

HUW BELL

“Core vocabulary” as a term refers generally to those lexical items which are accepted as being central and indispensable to language use, and is therefore of obvious interest to second language learners and teachers. It is the nexus of words which are independent of dialects or special registers, which are used frequently across a wide range of topics, and which all native speakers normally know and use. Core vocabulary is thus a relatively accessible term conceptually, and its precise meaning has been clarified considerably since the mid-1980s; as a term, “core vocabulary” has almost completely superseded such variants as “essential,” “basic,” “procedural,” and “nuclear,” although in some instances these have taken on more specialized meanings. (In this entry, “core vocabulary” will be used in place of all other terms where there is no difference in meaning.)

The notion of core vocabulary is not new: Murray (cited in Aarts & MacMahon, 2006, p. 463), in a foreword to the *Oxford English Dictionary*, refers to “a nucleus or central mass of many thousand words.” It is visible as a concept if not a term in such 20th-century lexical landmarks as the Vocabulary Control movement, the General Service List, and other early word lists, and it has a prominent and productive relationship with corpus linguistics.

The two key issues with core vocabulary are its definition and its applications. This entry deals with both. Stubbs (1986) and Carter (1987) have created a very full definition of coreness which is set out in the first section below; this is followed by a consideration of the uses of core vocabulary, primarily in language teaching and learning but touching on some other applications.

Defining Core Vocabulary

One basic truth about core vocabulary items is the fact that all normal native speakers know them. An often-used basis for defining whether a word is worth knowing is frequency: the more frequent a word is, the more useful it is; by extension, therefore, the more likely it is to be core. However, these points of reference—universality of knowledge among native speakers and high frequency—are inadequate as definitions of core vocabulary, the first because it requires native-speaker insight to establish, and the second because, as Stubbs points out (1986, p. 111), frequency is a consequence of, not a test for, coreness.

Stubbs (1986) proposes 12 descriptors of coreness and a much smaller set of general observations about what he terms nuclear vocabulary; Carter (1987) proposes 10 tests of coreness. Stubbs and Carter group their criteria in similar ways: a test for coreness is related either to the *neutrality* of words or to the *syntactic and semantic relations* between words. Stubbs’s and Carter’s criteria overlap considerably, and in the following summary, use is made of both. It also should be noted that many of the tests overlap to a large extent.

Syntactic and Semantic Relations

Superordinateness Core vocabulary items are more frequently superordinates than they are hyponyms. *Furniture, tree, and home* are core; *armchair, stool, ash, beech, maisonette, and bungalow* are noncore.

2 CORE VOCABULARY

Semantic productivity Core vocabulary items typically have more meanings than noncore items. A rough indication of this is in the number of dictionary entries a word has. As examples, core *run* and *book* have multiple meanings, whereas noncore items such as *sprint* and *paperback* are more restricted.

Formal productivity Core vocabulary items are used more productively to create compounds than noncore words. A core word such as *arm* can produce many more compounds than the noncore *limb*.

Power of substitution Core vocabulary items can replace noncore items; noncore items cannot do this so frequently. Syntactically, core *run* can do the work of noncore *sprint*, *trot*, *race*, *gallop*, *hurry*; but the noncore group cannot replace *run* in the same way. Semantically, noncore words can be defined using core words; but the reverse is not true.

Collocability Core vocabulary items form more collocations—have more allowable combinations with other words—than noncore items. *Yellow* contracts more collocational partnerships than *blonde*.

Antonymy Core vocabulary items are more likely to have agreed antonyms than noncore items. Core *happy* and *sad* have clear and relatively predictable antonyms in each other, but noncore *ecstatic* and *woebegone* do not have antonymous forms so readily and predictably available.

Neutrality

Core vocabulary is by its nature generic and nonspecific, but at least four types of neutrality can be specified.

Affective neutrality Core vocabulary lacks general affective connotations such as those based on attitude and feelings. Noncore *ancient* has a distinct set of associations, whereas core *old* is relatively neutral, although it can take color from its collocations.

Cultural neutrality Core vocabulary tends to be less marked by cultural associations, and is more directly translatable from one language to another. Carter (1987, pp. 183–4) cites *thin* as culturally neutral, and noncore *slim* and *slender* as culturally marked.

Contextual neutrality Core vocabulary does not betray its origins by association with a particular context. Specialist environments require specialist marked lexical items, so while *heart*, *chest*, *leg* are core, *fibula*, *nephrologist*, and *gastroenteritis* are not.

Register neutrality Core vocabulary is not restricted to a particular register. Core *ill* is not marked for a particular register, but *under the weather*, *poorly*, and *indisposed* are restricted to certain usages.

A few criteria for coreness do not fit well into the two broad categories above and are better regarded as frequent features, rather than defining characteristics, of core vocabulary. First, language users prefer to use core vocabulary when summarizing a text; this is clearly related to power of substitution. Second, core vocabulary items tend also to center around the middle on affective clines such as those used in Osgood, Suci, and Tannenbaum's (1957) semantic differential technique; this is a reflection of their general neutrality, since the poles of such clines illustrate markedness. English core vocabulary is usually Anglo-Saxon in origin, and tends *not* to be compound. Finally, core items are often more frequent than noncore.

The composite definition of core vocabulary above is not without problems. Core words are often *not* frequent, for example, and frequent words are often not core: the relationship between frequency and coreness is not simple. However, while there is substantial overlap between the categories—for example, there is an obvious relationship between Anglo-Saxon

origin and formal simplicity, or between superordinateness and power of substitution—this does not mean that the defining characteristics are deficient; it instead suggests rather strongly that the notion of coreness is best defined by a series of clines rather than a simple core/noncore distinction (Carter, 1987, pp. 189–90).

Applications of Core Vocabulary

The concept of core vocabulary is useful in several branches of applied linguistics and especially to second language learners and teachers. In second language learning, the idea of coreness originated in the 20th-century rationalization of vocabulary learning and teaching, and core vocabulary is visibly useful in several areas including the creation of coursebooks, graded readers, learner dictionaries, and other pedagogic materials; and the selection and ordering of lexical materials to teach or learn (from the vocabulary lists for individual lessons to entire lexical syllabuses).

Core Vocabulary and L2 Vocabulary Lists

Vocabulary selection—the choice of which vocabulary to teach or learn, particularly at lower proficiency levels—shares a number of issues with core vocabulary. That the chief aim of vocabulary selection is “to find the minimum number of words that could operate together in . . . the greatest variety of contexts” is stated very clearly (West, 1937; Jeffery, in West, 1953, p. v).

The words a learner needs initially may well be those which are relatively frequent, useful across a range of registers and topics, widely collocable, and providing good coverage of text; and to some extent lexical items which meet these criteria will overlap with core vocabulary. But this is only a general pattern, and, as McCarthy and Carter (2003) observe, although “core vocabulary based around the 1500–2000 most frequent words . . . does very hard work in day-to-day communication . . . raw lists of items need careful evaluation and further observation of the corpus itself before an elementary vocabulary syllabus can be established.” In general, the selection criteria for core vocabulary are broadly similar to those used in West’s 1953 General Service List and other general pedagogic lists. Some lists, notably the Academic Word List (AWL; Coxhead, 1998) have specifically avoided the most frequent items, yet in other respects the criteria for inclusion in the AWL are similar to those for defining core vocabulary—Coxhead’s *range* and *uniformity of frequency* clearly overlap with Carter’s *substitution* and *power of substitution*.

Core Vocabulary in Learner Dictionaries and Graded Readers

Core—or, at least, *controlled*—vocabulary has a clear role in the creation of simplified reading materials, including texts for inclusion in coursebooks, graded readers, and the definitions provided by learner dictionaries. Most major ELT (English language teaching) publishers have series of readers in levels based explicitly on lexical content (e.g., the Penguin Readers and Oxford Bookworm series). The criteria for core vocabulary are clearly applicable in the selection of vocabulary for these readers (with possibly a greater emphasis on frequency). With even more explicit reference to core criteria, “only the most common and ‘central’ meanings of the words on the list [are] used in definitions” in the 2,000-word Longman American Defining Vocabulary (Longman, *n.d.*). Other learner dictionaries make explicit reference to coreness in descriptions of their selection policy (e.g., Jones & Tschirner, 2006). The role of core vocabulary in simplified text is clearly related to its role in L2 reading skill and teaching which is aimed at improving this skill. The assumption is that a very small number of common words accounts for a very high percentage of most text:

4 CORE VOCABULARY

for example, Huckin and Coady (1999, p. 185) suggest that 3,000 most frequent words account for 95% of text, and that to be able to learn vocabulary incidentally from text, “learners need to have a well-developed core vocabulary.” Coady (1997, p. 287) stresses that these core items must be so well known as to be automatic.

Core Vocabulary and Register and Genre Studies

Core vocabulary has had some impact in studies of register and genre. Lee (2001) investigated how far spoken and written registers vary according to their use of core vocabulary, and concluded that coreness was “a cline or dimension of variation along which to measure texts” (p. 274). Hyland and Tse examined the relationship between academic writing and coreness (as represented by Coxhead’s Academic Word List), and “questions the widely held assumption that students need a single core vocabulary for academic study” (Hyland & Tse, 2007, p. 235). Core vocabulary has also been used deliberately as a tool in the creation of a “new” genre—that of an “educated variety of Japanese English” (D’Angelo, 2005).

Other Applications

Finally, there are a set of applications which use the term “core vocabulary” with a different meaning, or are only tangentially related. First, some use has been made of core vocabulary in studies of development of languages over time, and particularly in studying the timescales by which related languages have evolved from each other. “Core” here is usually taken to mean lexical items in very basic categories such as parts of the body, essential features of the landscape, and colors, which are presumed fundamental to early human experience, and from which calculations can be made about the time since languages split from each other (Swadesh, 1951). Second, core vocabulary intervention makes use of the central principle of “useful words” as a therapeutic instrument designed to assist children with speech problems of varying degrees of severity (McIntosh & Dodd, 2008).

Corpora and Literature

DAN MCINTYRE

The use of corpora to analyze literary texts is a methodological approach most commonly taken within the field of stylistics. Often defined as the linguistic study of literature, stylistics in its most general sense is the study of style in language (Crystal & Davy, 1966) and may be viewed as a subdiscipline of linguistics that falls within the sphere of applied linguistics. Although it is true that most stylisticians have concentrated on the analysis of literary texts, there is no intrinsic reason why stylistics should be limited to this text type; indeed, a good number of stylisticians have turned their attention to nonliterary texts using the same analytical techniques that are used to uncover stylistic devices in canonical literary writing (see Jeffries, 2010). Nonetheless, the principles of stylistics derive from work carried out on literary texts, and the value of corpora for stylistics lies in their capacity for allowing the testing of hypotheses about texts and stylistic theories more generally. In recent years, the use of corpora has validated theoretical ideas about the source of stylistic effects in texts by providing statistical support for foregrounding theory, one of the foundational elements of stylistics.

Foregrounding theory derives from the notion that style is a consequence of motivated linguistic choice. Selection from a range of linguistic options gives rise to particular stylistic effects (Ohmann, 1970, p. 264). These can manifest themselves as authorial style (the distinguishing linguistic features of, say, Dickens's style); genre style (the distinction between different text types, for instance, emails and conventional letters); and text style (the local effects created by the style of language used in a text). Foregrounding theory predicts that the elements of a text that are determined to be of particular stylistic import will be those that deviate in some sense from the norms of language, be those norms external or internal to the text in question. Van Peer (1986) demonstrated psychological support for foregrounding theory through the empirical testing of real readers. However, notwithstanding the fact that readers generally agree on what is foregrounded in a text, to determine the extent of foregrounding requires access to frequency information about linguistic norms, which before the availability of large-scale electronic corpora (representative databases of text) was unobtainable. Moreover, some linguists (e.g., Freeman, 1970) doubted the value of such frequency information, even if it were to become available. Such views, though, were inherently flawed, since it is only by understanding the statistical norms of language that we can determine whether a particular usage is indeed unusual and hence foregrounded. The advent of modern corpus linguistics provided the necessary means of determining these statistical norms and demonstrated that views such as Freeman's were mistaken. From this it should be clear that the value of corpora to stylisticians is immense, and while corpus-related work has not progressed as quickly in stylistics as it has within mainstream linguistics, it is on the increase and "corpus stylistics" is becoming an ever more prevalent term to describe corpus-related stylistic analysis.

Approaches to corpus stylistics may be divided into three types: (a) corpus-assisted analysis, (b) corpus-based analysis, and (c) corpus-driven analysis. While these distinctions are not unproblematic, they can be useful heuristically as a means of identifying common practices in corpus work. The first of these uses large reference corpora to assist the analysis of a single text. Corpus-assisted analysis may be carried out in order to validate

(or invalidate) the stylistician's intuition about the stylistic effects of particular linguistic structures. For example, in the Roger McGough poem "Vinegar," the poet says that sometimes he feels like a priest in a fish and chip shop queue who thinks that it would be nicer to buy supper for two (rather than, presumably, for just himself). Based on our schematic knowledge of priests, particularly the prototypical notion of them being unmarried, we might assume that the reason for this simile is that the speaker is ruminating on feeling lonely. However, a search for the collocates of *priest* in a reference corpus reveals a potential alternative meaning. The collocates of a particular lexeme are those lexical items that typically occur in close proximity to it. A search of the British National Corpus (a 100-million-word database of late twentieth-century British English) reveals that the most statistically significant collocate of *priest* is *lecherous*. This suggests that an alternative interpretation of the poet's meaning in "Vinegar" is that he is expressing a desire for a sexual rather than an emotional relationship (for a fuller analysis of this poem, see Jeffries & McIntyre, 2010). Of course, the range of texts across which a collocate is present in a corpus is an important consideration for stylistic analysis. Nonetheless, even if there were only one occurrence of *lecherous* as a collocate of *priest*, this would validate the response of a reader who saw this connotation in the poem. Collocation does not indicate the "correct" interpretation of a text. What it does do is indicate the range of interpretations that are valid. An excellent example of corpus-assisted analysis is O'Halloran (2007), and it is perhaps this kind of corpus-related work that will have most appeal to conventional literary critics; it does not require the construction of specialist corpora (there are plenty of commercially available corpora which can be used for corpus-assisted work), nor does it require particular expertise in computing and corpus analytical techniques. Instead, corpus-assisted literary analysis uses easily obtainable information to provide support for more conventional qualitative analyses of literary texts.

Corpus-based and corpus-driven analysis differ from corpus-assisted analysis by treating the target analytical text (or texts) as a corpus in its own right. The target text is then uploaded to whatever corpus analysis software has been chosen and is subjected to corpus analytical procedures to shed light on the meaning of the text(s) in question. Strictly speaking, if the object of analysis is a single text then corpus linguists would not recognize it as a corpus, since its dimensional restrictions do not allow for generalizations to be made about the language variety that it represents. Nonetheless, this difference of status does not prevent the application of corpus linguistic techniques to investigate the language of particular texts. When such analysis is focused entirely on the target text in order to extrapolate information relating to that text alone, this is *intratextual* analysis (Adolphs, 2006). When such analysis is supplemented by comparing the target text against a reference corpus, this is *intertextual* analysis (Adolphs, 2006).

The distinction between corpus-based and corpus-driven procedures (as described by Tognini-Bonelli, 2001; see also Francis, 1993) is that the former uses corpus analysis to validate existing theories and hypotheses, while the latter uses the results of corpus analysis to formulate new theories and hypotheses. While this distinction is useful in heuristic terms, it should be borne in mind that in practice there are overlaps between the two. Hardie and McEnery (2010) see the distinction as the difference between viewing corpus linguistics as a methodology (the corpus-based position) and seeing it as a subdiscipline of linguistics (the corpus-driven position). In practice, most corpus stylistic work involves a blend of the two approaches. An example of broadly corpus-based analysis can be found in McIntyre and Walker (2010), who analyze male and female speech in a corpus of blockbuster film scripts. This analysis takes hypotheses generated from the qualitative analyses of film critics and tests them on a large corpus of data. McIntyre and Walker's (2010) analysis provides support for some of these hypotheses (e.g., the notion that gendered roles are reflected in the topics that male and female characters talk about) while invalidat-

ing others (e.g., the notion that male characters operate in the margins of society). Stubbs (2005), on the other hand, is an example of broadly corpus-driven analysis. Stubbs uses corpus techniques to analyze Joseph Conrad's *Heart of Darkness*. Stubbs allows the results of an initial corpus analysis to determine his critical appraisal of the story, finding, for instance, that the word *grass* is associated by collocation with "death, decay and desolation" (Stubbs, 2005, p. 14). While it is possible that Stubbs was responding to literary critical comment on the novel (see Widdowson, 2008, for an alternative perspective on Stubbs's work), it is clear that many of his analytical discoveries would be unlikely to have been uncovered through qualitative analysis alone; here again is evidence that a corpus approach to literary analysis allows a greater degree of objectivity than is often found in the work of conventional literary critics. That corpus techniques should have been embraced by stylisticians is not surprising, given stylistics' concern with objective, rigorous, and falsifiable analysis.

While different in methodological approach, McIntyre and Walker's (2010) broadly corpus-based study and Stubbs's (2005) broadly corpus-driven study both used similar analytical techniques. The most straightforward of these is a frequency count of all the words in a corpus. However, while frequent words might be indicative of the propositional content of a corpus, as Stubbs points out, "textual frequency is not the same as salience" (Stubbs, 2005, p. 11). To determine whether a particular word is indeed foregrounded in our target corpus we need to measure its normal distribution in a reference corpus. For example, a single Dickens novel might be compared against a reference corpus consisting of either the rest of Dickens's novelistic output or a larger corpus of general nineteenth-century fiction. Doing such a comparison will highlight those words which are "key" in the target corpus; that is, words which are statistically more or less frequent than in the reference corpus. Scott (2009) has shown that the reference corpus used does not significantly affect the key word list that is generated, though as Culpeper (2009) points out, if the reference corpus and target corpus are closely related (e.g., one Dickens novel compared against all the other Dickens novels) there is a greater likelihood that the key words generated will be revealing of stylistic features specific to the target corpus. For example, in Stubbs's (2005) analysis of *Heart of Darkness*, one of the most significant key words is *seemed*, suggesting a preoccupation in the novel with uncertainty.

Of course, the list of key words generated is often very long and in such cases it is often an impossible task to analyze each of the key words in turn. In such cases we need a means of reducing the amount of data we have to analyze. One means of doing this is to use a different cut-off point for statistical significance. Corpus linguistic software calculates keyness using a statistical method such as a log-likelihood or chi-square test. Adjusting the *p*-value in such tests (that is, increasing the level of confidence we want to have concerning whether our findings are indeed statistically significant) will reduce the list of items. Sometimes this alone is not enough and we are still left with too much data to handle. Interpreting long key word lists thus demands a reliable procedure in order to distinguish those words that are simply statistically significant, and those which are both statistically and interpretatively significant. Many of the words in a key word list will be indicative of the content of the text—what is often termed its "aboutness" (Phillips, 1989). Such words can in many cases be disregarded. For example, *river* is a key word in *Heart of Darkness*, though this is unsurprising, given that the focus of the story is a river journey. Similarly we would expect proper nouns to turn up as key, since character names are often specific to one novel. Hence, we can often disregard these too (though this is not to say that proper nouns are never interpretatively significant). Determining key words that are stylistically revealing is often a matter of filtering out proper nouns and key words related to aboutness issues. Often, stylistically important key words are verbs or grammatical words, as with *seem*, above.

Keyness is one of the most useful indicators of style that corpus analytical technology can reveal. In addition to frequency and keyness, though, most corpus linguistic software packages offer an array of other analytical tools. One of these is the facility to compute *n*-grams (also known as “clusters” or “lexical bundles”). *N*-grams are words which turn up frequently in sequence (*n* simply stands for any number). For example, in McIntyre and Walker’s (2010) study of male and female character dialogue in blockbuster movies, it was found that among the most frequent 5-grams in the male speech were six grammatically negative clusters (e.g., “I don’t know I,” “I don’t know if”). If we look at the function of these *n*-grams in context, all of them are used to emphasize a complicating action in plot terms, and may thus be seen as one of the genre traits of blockbuster films. In the female speech, among the most frequent 4-grams are a series of interrogatives (e.g., “what are you doing?” “what do you want?”). The function of these clusters in context is to facilitate plot-explanatory dialogue from male characters, thus casting female characters in blockbusters in a predominantly supportive role.

A further analytical tool that is useful to the corpus stylistician is collocation. As we have seen, this can be revealing of the semantic meanings associated with particular lexical items, though as Louw (1993) has shown, collocation is also indicative of what he terms *semantic prosody*. For instance, the word *priest* in the Roger McGough poem “Vinegar” (above) might be said to have a semantic prosody of unlicensed sexual desire by virtue of its frequent collocation with *lecherous*. It is also important to point out that the analytical techniques described so far do not operate in isolation from one another. In an intratextual corpus-based study of Ian Fleming’s James Bond novel, *Casino Royale*, Mahlberg and McIntyre (2007) showed that one of the most frequent *n*-grams in the novel, “the back of the,” has a semantic prosody of violence, by virtue of its connection with violent events. Here, for instance, is a concordance extract of “the back of the” from the novel:

picked me up between them and shoved me into **the back of the** car. I went on struggling dead, each killed by a single .35 bullet in **the back of the** skull.
and down behind Bond’s back. Bond felt **the back of the** blade pass down his spine.
another blow, only to get a rabbit punch on **the back of the** neck which made him arch by the spill you took. He was standing at **the back of the** crowd with one of his men the spectators’ feet, his legs in the air. **The back of the** chair splintered with a

In each case, a violent event is related to each instance of the *n*-gram. For example, a character being kidnapped is shoved into “the back of the” car and a bullet is described as lodged in “the back of the” skull. This *n*-gram is loaded with a strong negative semantic prosody of violence, such that any instance of it once this has been established is likely to imbue the reader with a sense of unease concerning what is about to happen.

Frequency, keyness, *n*-grams, and collocation are perhaps the most commonly used analytical tools within corpus stylistics. However, these are not the only options open to critics wishing to use corpora to study literary texts. All the examples cited so far have focused on what can be gleaned from an analysis of raw text. Further stylistic insights can be gained by adding metalinguistic and nonlinguistic information to a corpus via a series of tags. Here we can make a distinction between annotation (the adding of metalinguistic information to a text) and mark-up (the adding of information about nonlinguistic variables). The easiest form of annotation is that which can be added automatically using a computer program. Aspects of linguistic structure that are form-based are easier to annotate automatically than those which have little or no basis in form. Hence, automatic part-of-speech tagging is a relatively straightforward process. The adding of such annotation means that it is then possible for the analyst to extract information not simply about the

frequency and keyness of words, but of the frequency and keyness of tags too; for example, which parts of speech are key in a text. Annotation of categories that are not form-based must be done manually. To date, the most intensive stylistic study to use annotation is Semino and Short's (2004) project to tag a corpus of 260,000 words of English writing (comprising fiction, news, and biography) for categories of discourse presentation (see also the related project to add discourse presentation tags to a corpus of spoken British English, reported in McIntyre et al., 2004). By doing this, Semino and Short (2004) were able to test the model of speech and thought presentation first outlined in Leech and Short (1981), and in so doing found quantitative support for the notion that direct speech is the semantic norm for speech presentation. In addition to various other findings, they also revealed the necessity of a parallel scale of writing presentation, results that would have been impossible to achieve via solely qualitative analysis.

The techniques described in this entry require corpus analysis software. Numerous packages are commercially available and of these perhaps WordSmith Tools (Scott, 2004) is the best known, though other packages such as AntConc (described in Anthony, 2004) are equally good and, in some cases, free. The Web-based Wmatrix (Rayson, 2008) is also highly recommended. In addition to the conventional corpus tools featured in WordSmith and AntConc, Wmatrix automatically annotates uploaded texts for part of speech and semantic categories, allowing for the analysis of key parts of speech and key semantic domains. All of these software packages can be found via the Web. Finally, a range of electronic texts and corpora, many of which are freely available, are stored at the Oxford Text Archive (<http://ota.ahds.ac.uk/>). The use of corpora in literary analysis is likely to increase as literary scholars become increasingly aware of the advantages they offer. This approach to literary studies improves substantially on more subjective methods by allowing a more objective and falsifiable approach to text analysis. As Sinclair (2004) notes, in all approaches to linguistic analysis it is imperative that we "trust the text." Using corpora allows us to do just that.

Corpora in Language for Specific Purposes Research

VIVIANA CORTES

Among the various approaches that are often used to study language for specific purposes (LSP), those focusing on the analysis of the genres used by the target discourse communities have attracted a high degree of attention in the last decade. The members of different discourse communities develop specific communicative practices and conventions to communicate with one another and with other communities. Language learners who need to acculturate to a new community that uses a specific language type need to become aware of the forms of discourse used by those communities. For many decades, the description of these discourses was done by analyzing a single text or a very limited number of texts, in an attempt to provide language learners with a framework of reference for the acquisition of this specific language and to help materials designers develop materials that could be used for the teaching of LSP. With the advancements in computer technology and the collection of language corpora (large collections of machine-readable language texts) that have been taking place in the past two decades, the use of recurrent features of language that mark the tendencies of a discourse community can now be easily identified and analyzed. Technology now allows for the collection and storage of hundreds of thousands or millions of texts that provide data to describe language in detail, basing that language description on empirical findings instead of mere intuition.

Corpus studies of LSP discourse cover a wide variety of text types although it is necessary to point out that the bulk of the investigations have been mainly in the field of language for academic purposes (LAP), particularly English for academic purposes (EAP). The major journals in the LSP and LAP fields as well as many edited volumes that focus on these areas of text analysis have shown a strong tendency in the use of corpora for this type of investigations and teaching situations in the past ten years. After a short section that introduces different approaches to the use of corpora in text analysis, the remains of this entry will describe a number of studies that used corpora to analyze LSP and LAP. It is important to point out that the number of corpus-based studies in those areas is extremely high and new studies are continually being developed and added to the literature in applied linguistics, thus the list of studies presented here is far from comprehensive.

Using Corpora to Analyze LSP

Researchers and instructors in LSP try to understand the linguistic characteristics of specialized registers. Traditionally, those investigations have been based on texts and have analyzed the language in authentic texts. Corpus-based text analysis provides the advantage brought about by using a large, principled collection of texts, and by combining quantitative and computational techniques with qualitative interpretations. Corpus-based research methods often focus on the description of lexical, grammatical, or discourse features. When considering the use of corpora for the analysis of LSP, researchers “often have research questions relating to the description of ‘registers’ rather than individual linguistic features” (Biber, Conrad, & Reppen, 1998, p. 135). Registers are situationally defined

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

DOI: 10.1002/9781405198431.wbeal0225

varieties of language. Some registers are very specific such as introduction sections in research articles in organic chemistry, while other registers are more general, like everyday conversation or newspaper writing. The application of corpus-based techniques to register analysis is a very powerful tool that can provide a framework for comparison to identify register variation more accurately.

As previously mentioned, many corpus-based text analyses focus on the study of particular lexical features, specific grammatical structures, and some characteristics of the discourse under consideration. In the investigation of register variation, corpus-based approaches can be employed to find answers to compare the use of specific lexical or grammatical features across registers or to provide comprehensive descriptions of specialized registers. While many LSP studies have used mega-corpora to analyze register variation, an increasing number of studies use specialized corpora made up of texts similar in topics and type. These corpora are generally called “small” corpora, collections of texts of less than a million words. Among those studies that focused on lexical features in specialized registers, we can mention, for example, Gledhill’s (2000) study of academic articles on cancer research. These studies compared keywords across the sections of those articles, identifying significant words and their functions in each of those sections. An example of corpus-based grammatical studies is presented by Biber et al. (1998). These authors investigated the difference in the use of dependent clauses across spoken and written registers (conversations and prepared speeches vs. academic prose and official documents), focusing on the way in which relative clauses, causative adverbial clauses/subordinate clauses, and *that*- complement clauses are used across these registers.

The linguistic analysis of corpora is often conducted using computer programs for linguistic analysis. This software can be commercially available or free downloadable software, as in the case of the well-known concordancers. Computer programs can also be specially designed for specific studies. The advantages of specially designed software lie in the fact that software designers can tailor these computer programs to their needs and in that way elaborate more sophisticated research questions, as in the case of grammatical taggers, for example. Nowadays, many studies of LSP discourse use multidimensional analysis of language corpora that had been grammatically tagged to statistically analyze frequencies of a wide range of linguistic features simultaneously. As Biber et al. (1998) emphasize, the results of such studies allow researchers and teachers to “understand more fully the specialized registers that students seek to master, as well as the differences from other registers that students are exposed to” (p. 170).

The most widespread use of corpus-based methodologies in the analysis of LSP is undoubtedly related to the analysis of discourse organization. In order to attain a generalizable corpus-based description of discourse structure, several analytical steps are needed, such as determining the type of discourse units and the communicative functions these units perform, segmenting the texts into these discourse units, classifying these discourse units by type and category, and studying the linguistic characteristics of each discourse unit in each text and across all texts in the corpus. These procedures can be completed following a “top-down research approach or a bottom-up research approach” (Biber, Connor, & Upton, 2007, p. 12). These corpus-based research approaches have different starting points and the results they yield present different types of information on the texts that make the corpus under consideration. Biber, Connor, et al. (2007) present a comprehensive description of these methodologies and a number of studies are introduced to illustrate both approaches.

The top-down approach consists in studying the corpus in search of organizational patterns that represent communicative functions used by the members of the language communities that are being investigated. The first step in the top-down approach is to develop a framework of analysis which is then used to determine the discourse unit types

that may be identified in the texts being studied as well as the communicative functions performed by these units. Then, the framework is used in the analysis of all the texts in the corpus. The most popular use of this approach for the analysis of LSP can be found in “move analysis,” which was introduced by Swales (1990) in his seminal work on research article introductions. In this approach the text is described as a sequence of rhetorical moves that fulfill a clear communicative function. Texts consist of a series of functional units called “moves” which help fulfill the communicative purposes of a genre. Moves vary in length and they can be the result of the combination of multiple steps. Many researchers have used move analysis to determine the discourse organization and the communicative purposes of research articles in various disciplines and of each of the sections of the research article, as well as in the analysis of other academic genres, such as book reviews. The same type of move analysis was used in the analysis of other type of specialized discourses such as grant proposals and research grants, both in American and European contexts.

The bottom-down approach to the analysis of discourse organization, on the other hand, uses specialized software to segment the texts in the corpus automatically into discourse units. This segmentation is based on linguistic criteria. The discourse units are then studied for a wide variety of linguistic features and they are grouped into discourse unit clusters which share linguistic characteristics (Biber, Connor, et al., 2007). In the bottom-up approach, the procedure starts with the segmentation of the corpus, followed by the analysis and classification of the units and a linguistic and functional description of the discourse categories identified, and the tracing of tendencies in the discourse organization. Some researchers call these discourse segments vocabulary-based discourse units (or VBDUs) and they are mainly identified by boundaries established by the introduction of new information through new vocabulary in the discourse (Biber, Csomay, Jones, & Keck, 2007). This approach was also used to segment and analyze various types of registers such as university classroom sessions and research articles.

In spite of the different procedures used in these approaches, both of them can complement to provide a more comprehensive description of the register under analysis. Biber, Csomay, et al. (2007) agree “that the overall patterns of discourse organization documented by move analysis are generally compatible with those documented by VBDU analysis” (p. 257).

Corpora in LSP

The great majority of the research of studies that described the language in settings other than those connected to academia using corpus-based analyses was conducted in business settings. Most of these studies used top-down approaches to the study of discourse organization. Yeung (2007) for example, studied a small corpus of authentic business reports in search of tendencies in the use of certain lexico grammatical choices and rhetorical features. Flowerdew and Wan (2006) analyzed tax computation letters and a corpus of authentic written auditors’ reports from a large international Hong Kong accounting firm, analyzing the structural organization as well as the linguistic and functional realization of this register. Similar methodologies were used to analyze other types of business-related discourse in order to find tendencies in the use of lexico grammatical choices and rhetorical features, as in the case of business reports and faxes, and special business correspondence, such as collection letters.

Several specialized corpora have been collected to study various aspects of spoken business English. McCarthy and Handford (2004) conducted a study of spoken business English based on the analysis of CANBEC, the Cambridge and Nottingham Corpus of

Business English, a collection of texts transcribed from spoken business English recorded in companies of all sizes, from multinational companies to small partnerships. In addition, the Hong Kong Corpus of Spoken English, a collection of conversation and public discourse produced by Chinese speakers, has been transcribed for prosody and intonation and has been used in multiple studies, particularly in the context of the hotel industry for the analysis of different aspects of this specialized discourse. In addition, various studies have recently been focusing on the investigation of the language of outsourced call centers using large-scale corpora that represents the typical interactions and communicative tasks performed in centers in different part of the world that serve English-speaking customers. Studies based on these corpora analyze the frequency distribution and functional characteristics of a wide range of lexico grammatical features.

Studies of philanthropic discourse have also been made using corpus-based methodologies in the last decade to investigate the organizational patterns and linguistics conventions frequently found in various types of fund-raising discourse such as grant proposals (Connor, 2000) and fund-raising letters (Upton & Connor, 2004). Often, these investigations make use of corpora specially designed for these analyses.

A section of the *Longman Corpus of Spoken and Written English* (Biber, Johansson, Leech, Conrad, and Finegan, 1999) was used in a comprehensive grammatical analysis of newspaper writing that reports statistical analysis of this register in comparison to the other registers in the corpus (conversation, fiction, and academic prose). Other studies have also used corpus-based approaches to the study of different aspects of newspaper writing such as the language of headlines and the use of metadiscourse markers to indicate persuasion in this register.

Some studies have used corpora and corpus-based methodologies to investigate the discourse of professional communities outside the business realm, such as architectural discourse, wine-tasting notes, or sports-related discourses focusing on the analysis of rhetorical structures or figurative expressions (Caballero, 2007).

Corpora in LSA

As mentioned previously, the study of language in specific academic settings has made extensive use of corpus-based methodologies. The frequent grammatical features of academic prose have been researched exhaustively in statistical analyses of this register in English as a whole (Biber et al., 1999) and in studies of individual academic registers that used small, specialized corpora of different languages to analyze various linguistic features or discourse organization. The work of Coxhead (2000) that produced the Academic Word List is worth mentioning in this section, as the data in her study has been used as a framework of reference in a large number of investigations of academic vocabulary and for the creation of academic word lists in languages other than English, such as, for example, French.

From the numerous written and spoken academic registers that have been investigated using corpora and corpus-based tools, the experimental research article has been the principal focus of analysis. The bottom-up corpus-based approach has been used to identify and analyze a wide variety of lexical and grammatical features in the experimental research article as a whole or across its sections, within or across academic disciplines. Many of these studies focused on individual linguistic features such as shell nouns or the use of discipline-specific vocabulary. Another group of investigations focused on the identification and analysis of frequent collocations, such as the study of collocations in specialized corpora like medical or pharmaceutical texts (Gledhill, 2000) as well as the study of lexical bundles, expressions defined as extended collocations, in research articles in history and biology (Cortes, 2004), or lexical bundles in four different disciplines in comparison to

other academic genres (Hyland, 2008). Other studies concentrated on salient language structures in this register such as the study of evaluative *that* (Hyland & Tse, 2005), the syntactic analysis of research article titles (Wang & Bai, 2007), and the study of conditionals in medical research articles (Ferguson, 2001). In addition, as previously mentioned in the corpus-based methodology section, many top-down studies focused on the organization and rhetorical analysis of the research article using Swales's (1990) framework of move analysis in whole articles and article sections across disciplines. In addition to the study of research articles, these approaches have also been used to investigate other written academic registers such as theses and dissertations.

Some studies of academic registers have focused both on spoken and written varieties. One of the most comprehensive studies of the language used in university settings can be found in Biber et al. (2004) and in Biber (2006a). The corpus analyzed in these studies covered a variety of spoken registers such as classroom management talk, lectures, speeches, student-professor conferencing, and study group interaction, as well as conversations in the dormitories and service encounters at the cafeteria in various universities across the United States. The written registers covered textbooks, research articles, and other scholarly publications as well as university inception and activities brochures, and written classroom materials such as syllabi. This study presents a thorough analysis of these registers and a comparison across registers and major academic areas. A series of other studies have been conducted on this corpus to analyze specific linguistic features such as, for example, lexical bundles (Cortes & Csomay, 2007) and stance (Biber, 2006b). In addition, MICASE, the Michigan Corpus of Spoken English (Simpson, Lee, & Leicher, 2003), a recorded and transcribed collection of 200 hours of academic speech from across the university, has been used in numerous linguistic studies (Louwerse, Crossley, & Jeuniaux, 2008).

Biber et al. (1998) report that in recent years corpus-based analyses have become popular for studies of historical linguistics as this area of linguistic study always relied on the study of text collections from past periods to trace linguistic developments chronologically. Diachronic corpora allows for a wide variety of research questions. Some studies have analyzed the historical development of research genres, such as the comparison of medical research articles to speech-based registers from the ARCHER corpus (Biber et al., 1998) and Atkinson's (1992) study of the development of medical discourse over two centuries.

In addition, contrastive analyses of academic registers using parallel corpora are becoming popular in the applied linguistic field (Johansson, 2007) because they help reveal characteristics of parallel and translated texts and they can inform about the analysis of linguistic phenomena that takes place when transferring information across languages. Some studies have focused on the lexical bundles in research articles in Spanish and English (Cortes, 2008), the comparison of the language and organization of book reviews in English and Spanish (Moreno & Suárez, 2008), and the study of research article introductions in Portuguese and English (Hirano, 2009).

It is undeniable that the use of corpora and corpus-based methodologies in text analysis has contributed to great advancements in the research of LSP. The findings of corpus-based studies of LSP provide invaluable information for the better description of these discourses and the direct application of the empirical results of these investigations, which are based on the natural use, to the teaching of these. It is expected that these methodologies will continue evolving, which together with the collection of more and more varied corpora of LSP could help provide a more comprehensive study of these specialized registers.

Corpora in the Language-Teaching Classroom

CHRISTOPHER TRIBBLE

Introduction

From the earliest days of language corpus development, corpus researchers have advocated the use of corpus resources in language education, and made significant claims for the impact that language corpora will have in the language classroom:

Very large collections of language text will shortly become available cheaply on CD-ROM. Quite young learners will gain access to this and will become self-taught DDL (data-driven learning) students. Problems will arise when the textual evidence does not fit the precepts of classroom and text book, and the mythology will prove no match for the facts. (Sinclair, 1997, p. 30)

Pedagogically, the use of language corpora in language teaching has been justified from two main perspectives.

The data-driven learning (DDL) model (Johns, 1991) is situated within the learner autonomy tradition in language education. The key idea in DDL is that learners learn best when they “discover” the language in the same way that corpus linguists do; that is, through a bottom-up process of rule building on the basis of observation and analysis of language data. In a DDL framework, the corpus offers a means whereby students can take control of their own learning, with the teacher taking on the role of facilitator and co-researcher.

An alternative but compatible justification for the introduction of corpora to the language-teaching classroom is found within *schema theory*. Cook (1997, p. 86) comments that: “A schema is a mental representation of a typical instance. Schema theory suggests that people understand new experiences by activating relevant schemas (also called ‘schemata’) in their minds.” For Widdowson (1984) schema theory has relevance to language learning, because this latter can be conceptualized as a process in which meaning and form become associated through repeated exposure to patterns of language in use, thereby establishing schemata. Corpus tools provide an ideal starting point for the investigation of language-in-use and the building of schematic knowledge because: “they allow learners to observe *what* is typically said in given circumstances, and *how* it is typically said, and to relate the two.” (Bernardini, 2004, pp. 17–18, emphasis in the original).

Despite the developments which have taken place in both direct and indirect applications of corpus data in language education (Römer, 2008) the use of corpora in language learning classrooms has occurred much less widely than had been expected. Although a wide range of corpus-informed learners, dictionaries, and grammar reference works have become available to language students and language teachers in recent years (e.g., Biber, Johansson, Leech, Conrad, & Finegan, 2000; Rundell, 2007), and while attempts have been made to show how corpus investigation can be used in the language classroom (Tribble & Jones, 1990; Johns, 1991, 1994; Aston, 1996; Flowerdew, 1996), the evidence for the successful use of corpus resources in these contexts remains slight (Chambers, 2005; Aijmer, 2009).

One problem has been that corpora prepared for non-language teaching purposes, for example, the British National Corpus (BNC), have proved difficult to exploit in language classrooms. A possible alternative solution, that of tailoring the corpus to meet the needs of language learners, may prove to be more fruitful (Braun, 2007), but even here, problems remain. Braun's (2007) study offers some evidence of success in integrating corpus research into a language course for 14–18 year olds. However, Braun's study also highlights the scale of the challenges that still exist. These include the problem of getting the right data for language learner corpora and, importantly, the need for teacher training in the use of corpora in materials development and classroom applications.

Corpus Resources for General Language Education

A good match between corpus resources and learner needs is an essential pre requisite for the successful use of corpora in language education. In general language teaching, corpus resources have the potential to provide students with an accessible and effective means of extending their understanding of how words are used in context. Where the emphasis is on function words (e.g., determiners, prepositions, modal verbs), Biber (1990) has demonstrated that small balanced corpora such as the BNC Baby (a 4-million-word subset of the British National Corpus containing 1 million words each of academic writing, newspaper language, spoken conversation transcripts, and prose fiction) can be helpful to learners and teachers.

As an example, consider the case of students in a lower level group who have problems with the position of the adverb *already* in a declarative clause: "The most unloved person who ever lived was Sue. When Sue was born her parents did not want her as they had *already* ten children to look after." Using data from the BNC Baby News subset it is possible to provide learners with a printout like the one in Figure 1. The task requires learners to identify where in the clause the word *already* is most frequently found and to formulate, if possible, a rule which describes its behavior in such contexts (BNC Baby, 2005).

With the evidence to hand, learners should be able to see that *already* comes either after the verb "to be" when it is used as a main verb (*he is already PPS to the Chancellor . . .*), or between an auxiliary and a main verb (*we have already sold . . . , certain names will already be . . .*), or simply in front of the main verb (*which already existed . . . , who already have the Body Shop franchise . . .*). On the basis of these kinds of insight they can form a provisional rule for the use of *already* and try it out in their own writing.

It is important to note that this kind of pedagogic support requires a significant level of mediation by the teacher. The teaching materials should not contain overwhelming amounts of data, and the concordance lines which are presented to students must be selected to present useful examples from which students can learn. Presenting learners with thousands of rows of unmediated concordance output is a recipe for failure. Indeed, in many circumstances, especially with beginners, the effort involved in learning to use corpus investigation tools and in filtering out irrelevant or confusing examples would often be much greater than the benefits which students could gain from the task. In such cases a modern, corpus-informed reference work or course book will usually give learners the insights they need more quickly and effectively than large amounts of corpus data.

For learners who need to build knowledge of specific vocabulary, a general corpus is unlikely to provide enough examples to be useful. This problem can be resolved, however, through the use of teacher-developed small corpora which make use of online or CD-ROM encyclopedias such as Encyclopedia Britannica (www.britannica.com) or Wikipedia (www.wikipedia.org). While many higher education institutions discourage the use of Wikipedia as an academic reference resource (because its authority is open to question), as a source of language forms it can be extremely useful.

As an example, consider the case of a group of business studies students who are confused about the distinction between the words *economic* and *economical* in English. A micro-corpus containing business-related texts (taken from Wikipedia in this instance) can provide rapid exemplification of the contrast between these two words. Students can then be asked to elaborate a "rule" for the use of the two words using concordance output (as in the selection in Figure 2) and collocate information derived from larger concordances for *economic* and *economical* (see Figure 3).

Typically, students can be expected to come up with statements such as:

On the basis of the available evidence you use the word *economic* with reference to systems of trade and the management of money, or to the study of these systems. You use *economical*, by contrast, when referring to things which are inexpensive or not wasteful.

The advantages of an electronic encyclopedia micro-corpus in this instance are that: (a) the texts are presented in contexts that are interesting and accessible for the learners, and (b) although the corpus is small it offers sufficient (rather than overwhelming) data.

Teaching Language for Specific Purposes

A context in which appropriate text corpus resources can be particularly helpful is that of language teaching for specific purposes. In such contexts two kinds of corpus data are typically used: *exemplar* and *analog* corpora.

An *exemplar* corpus is a collection which contains texts that are identical in communicative purpose and organizational structure to the texts the students want to learn how to write. On a business English course, examples of these kinds of text genres might be

- brochures for products or courses,
- mission statements for corporate organizations or international charities,
- writing from the students' own disciplinary areas (assignments, dissertations, etc.),
- offer letters for financial services.

Students in an academic writing program can gain valuable insights from the use of exemplar corpora as in, for example, the study of citations in academic writing (Hyland, 1999). Difficulties of building exemplar corpora can be overcome by the simple strategy of asking students to provide electronic versions of articles or other texts which are important to their studies, along with examples of their own writing (with a record of the grade achieved).

An *analog* corpus contains texts which, while they are not identical to the texts that students are learning to write, are close enough in communicative purpose and organizational structure to have pedagogic value. Such a corpus might be useful for a teacher who faces the problem of developing a corpus of relevant text exemplars for students who come from a wide range of disciplinary backgrounds, as in many English for specific purposes (ESP) and English for academic purposes (EAP) programs.

Examples of analog corpora could include

- academic journal articles (for use in writing programs for students in higher education),
- factual junior encyclopedia essays and articles (for use in lower level writing courses),
- collections of texts drawn directly from language teaching course materials (for use in elementary courses).

One of the best examples of a learning program based on the use of an analog corpus can be found in the Kibbitzer program at the University of Michigan (<http://micase.elicorpora.info/micase-kibbitzers>). Using examples from university lectures, seminars, and written work, the materials allow learners (with the support of tutors) to investigate important aspects of the use of English in a North American academic setting.

The Issue of Native-Speaker Data

A final concern which needs to be discussed in this section is the extent to which native-speaker corpus data is appropriate in the foreign language learning classroom. Widdowson has commented that in the project of language education: "We are concerned here not primarily with what language users know, but with what language learners need to know" (Widdowson, 1991, p. 20).

This statement raises a number of important issues with regard to the kinds of examples which should be offered to learners, and the pedagogic processes which should be deployed in order to make them relevant to their learning needs. Thus while strong arguments have been made in favor of the use of native-speaker data as a resource in curriculum and materials development (O'Keefe, McCarthy, & Carter, 2007), others have argued in favor of the use of corpus data based on lingua franca encounters (Seidlhofer, 2000). Their claim is that this variety represents the majority of interactions between speakers of English as a foreign language, and offers, therefore, a more appropriate model for foreign language pedagogy (see the extensive discussion in Seidlhofer, 2003).

It can, however, be argued, that when building a corpus for advanced level students of writing, the native/non-native status of the writers whose texts are included in the pedagogic corpus is of less importance than their expertise as writers in their disciplinary area.

Technological Requirements for Using Corpora in the Language-Teaching Classroom

For teachers or course book writers with access to the Internet, several free resources are available for the preparation of classroom materials or activities. One of the most useful currently available is at Brigham Young University's Corpus website (<http://davies-linguistics.byu.edu/personal>). Using the tools provided through this site it is possible to work with the British National Corpus, the TIME Corpus of American English, and corpora of contemporary and historical American English. Samples from the British National Corpus can also be accessed through the BNC website (www.natcorp.ox.ac.uk/using/index.xml. ID=simple), and limited searches of the Collins Wordbank (www.collins.co.uk/Corpus/CorpusSearch.aspx) can be carried out online. The WebCorp search engine also provides an excellent way of systematically searching the Internet for linguistic data and presenting results in ways which can be educationally useful (www.webcorp.org.uk; see also <http://tiny.cc/corpora>).

Hardware and Software

The hardware requirements for developing and analyzing classroom corpora are now available on most basic personal computers. For the development of specialist corpora it can also be useful to have access to a desktop scanner and optical character recognition (OCR) software which can convert scanned images of documents into machine-readable text. For those interested in developing corpora from electronically published data, it is also essential to have access to software which is able to convert large numbers of PDF documents to a plain text format.

To carry out corpus research it is essential to have access to a corpus analysis or concordancing package (output from such programs has already been shown above). The two best known commercially available options are WordSmith Tools version 5 (Scott, 2008; www.lexically.net/wordsmith/) and MonoConc Pro (Barlow, 2000; www.athel.com/mono.html), while AntConc (Anthony, 2006; www.antlab.sci.waseda.ac.jp) offers a cost-free

alternative, and is particularly useful for the processing of smaller corpora. All these programs allow the user to make wordlists and concordances, and to generate examples of collocations (groups of words which typically occur together). WordSmith Tools and AntConc also enable the study of phenomena which Scott (1997) calls “keywords,” that is, words which are statistically prominent in a research corpus when it is compared with a larger corpus, and of the frequently occurring multiword combinations which Biber and Conrad (1999) call “lexical bundles.”

Conclusion

Although corpora have not been used in mainstream education to the extent which might have been hoped for, they are emerging as an important resource in teaching in specialist language areas (Thompson, 2007) and are likely to constitute an essential resource in pedagogic accounts of specific language use. There is also a much higher level of awareness of the potential of corpora on the part of teachers and publishers than hitherto, and if appropriate corpora can be made available to meet the needs of a wide range of learners, there is a good chance that the predictions of the pioneers of corpus-informed language education may yet be fulfilled.

Corpora in the Teaching of Language for Specific Purposes

VIVIANA CORTES

The analyses of specialized corpora (i.e., large collections of machine-readable texts) help describe language in detail, providing data that can be easily transferred to pedagogical contexts. Thus, corpus-based language analyses have become an invaluable tool in the teaching of, and materials design for, language for specific purposes (LSP), as language learners need to master the specific discourses used in their new language communities to become successful members of those communities.

The origins of the relationship between corpora and English-language teaching seem to go back to the second part of the 1980s (Gabrielatos, 2005). After the publication of the *Collins COBUILD English Language Dictionary*, several papers reported the use of corpus-related materials in the language classroom (Johns, 1988). The relationship between corpora and language teaching has been evolving ever since and has resulted in an important number of corpus-based research studies that report pedagogical applications of corpus-based research findings (Sinclair, 2004; Flowerdew, 2005).

There seem to be two general approaches to the use of corpus-based materials in the classroom. Instructors can analyze corpora and use the results of these analyses for materials design or they can introduce corpora into the classrooms, training students to use them (Partington, 1998). The former approach is often called the soft approach, while the latter is called the hard approach (Gabrielatos, 2005). In the former approach, instructors often try to determine frequency patterns for specific linguistic features and use those analyses to answer questions that were raised in class, or perhaps instructors may use corpora to generate authentic data and examples. In the second approach, instructors provide students with appropriate training to explore corpus materials to conduct linguistic inquiry by themselves, and they may also introduce students to the different states of corpus collection. In her comprehensive review of corpus- and genre-based approaches to text analysis, Flowerdew (2005) highlights the importance of the identification of specific genres to be explored in the English for specific purposes (ESP) and English for academic purposes (EAP) class. A corpus designed to inform classroom teaching or materials design could provide learners with opportunities to draw generalizations on genre that they could eventually transfer to their own language production (Tribble, 2002). Students' analyses of corpora make use of techniques connected to data-driven learning (DDL) (Johns, 2002), a process which "confront[s] the learner as directly as possible with the data" (p. 108) allowing the learner to become a language researcher and discover patterns in the language through activities that explore language learning as schema-based restructuring (Bernardini, 2004).

When students have to create a text in the target language which belongs to a genre they might not be familiar with, they should examine similar instances of that genre to try to discover linguistic conventions and the discourse organization patterns which are not easily found in dictionaries or grammars (Flowerdew, 1993a). This is part of the rationale for the creation of corpus-informed materials or corpus-based course curricula for LSP courses, trying to use a twofold top-down/bottom-up approach to the analysis of the target language. Integrating corpus-based analysis to genre-based approaches to text

analysis helps integrate these approaches in order to provide a better description of the target registers under analysis. In addition, the use of learner corpora (collections of texts produced by non-native speakers of the target language) provides a very valuable resource for LSP materials design and language teaching.

Producing corpus-based materials for teaching general English is a very complex procedure and can involve a wide variety of variables which may go beyond corpora collection and analyses (Gavioli, 2005). In spite of the advantages of using corpora in materials design, corpus work meant for the design of a syllabus for a course of general English can be an overwhelming task, which is reflected by the few truly corpus-based and corpus-informed materials that are currently commercially available (McCarthy, McCarten, & Sandiford, 2005). In the world of teaching LSP, on the other hand, “corpora may be a practical and very interesting resource” (Gavioli, 2005, p. 23) as a corpus made up of specialized texts can produce the linguistic features that characterize those registers, and those items can be used in the design of LSP syllabi. The use of small specialized corpora to teach LSP is not without some concerns, however. Sometimes, students who work with small, specialized corpora may try to transfer their findings beyond the scope of the register they analyzed through these corpora to less specialized texts. This drawback, however, can be avoided by providing students with different types of corpora that could clearly show them the limits of their extended generalizations.

Corpora and Corpus Tools for LSP

LSP teachers have always been more interested in “what to teach” than in “how to teach” (Hunston, 2002, p. 198); that is, they need to make their students aware of the language features that characterize the specialized target language. Corpus studies can be a great help in making many pedagogical decisions because they often focus on the frequent vocabulary and typical phraseology of certain registers and also on the way in which language users organize their discourse and relate to their audiences. A specialized corpus is a collection of texts that represents a sample of a sublanguage (which can be more or less specialized) and such corpora “reflect the teaching or research purpose they were produced for” (Gavioli, 2005, p. 61).

When using corpora and corpus data in the LSP classroom, the most popular corpus analysis tool is the concordancer, not only for the teacher or materials designer developing curriculum or specific materials for a class, but also for students who are exploring the corpus themselves. Concordancers are computer programs that can be acquired commercially or sometimes freely downloaded from the Internet. This type of software allows for many aspects of linguistic inquiry: key words, key words in context (KWICs), and n-grams are among the most popular. Key word analysis produces lists of words that occur very frequently in a register in comparison to some norm. This application, for example, allows LSP teachers, materials writers, and students to create specialized word lists that can be easily identified in a single text or a corpus of specialized texts (O’Keefe, McCarthy, & Carter, 2007). KWICs (or concordance lines) provide information to identify the “lexico-grammatical profile” of words and expressions (p. 14), such as the word’s most frequent collocates, fixed expressions in which the word may often be found in, as well as its syntactic and semantic restrictions together with its prosody or the particular environments in which the word commonly occurs. A wide variety of corpora that can be accessed online (McEnery, Tono, & Xiao, 2006), such as the Michigan Corpus of Academic Spoken English (MICASE) (Simpson, Lee, & Leicher, 2003) or the Corpus of Contemporary American English (COCA) (Davies, 2008) offer online concordancers with specific applications that can be used for online linguistic searches on the texts provided by the corpora in the website. Hyland (1996) stresses the importance of concordanced output for the analysis of

certain linguistic features in specialized registers, such as the use of hedges in particular sciences. Corpora and concordancers have become essential tools in the identification and analysis of specialized vocabulary and the use of idioms in specialized contexts for LSP teaching.

Corpora in LSP and LAP Materials and Curriculum Design

Numerous studies revealed the advantages of using corpora in the LSP class and in the development of LSP materials (Ketterman & Marko, 2002; Gavioli, 2005), with many examples of this approach to LSP teaching belonging to the field of language for academic purposes (LAP). It is important to explain here that commercially available corpus-based LSP materials for teaching specific genres connected to target languages are not easy to find. In addition, many important differences have been found when comparing LSP textbook data and LSP corpus data. For example, Thompson and Tribble (2001) described citational practices in academic writing together with the language forms used to realize these citations. They reviewed published teaching materials produced for this purpose and found that these materials offer little constructive support to novice writers, as most of the textbooks reviewed did not provide explicit advice on how to manage citations in different disciplines.

The majority of the corpus-based materials used in this approach are built and developed by course instructors or materials designers in charge of adapting or developing materials for particular LSP situations. Bovea Menero (2001) conducted a study in which she compared a small corpus of authentic business letters and a corpus of business letters from English textbooks, focusing on ways of addressing the addressee, ways of making personal allusions, colloquialisms, and the use of subtechnical business vocabulary. The results of her study showed that the language used in authentic letters was more colloquial and direct than that used in textbook letters, which results in shorter and more personal allusions in the authentic letters and longer, more verbose, and rather more formal texts in the textbook corpus, confirming that the analysis of corpora made up of authentic texts provides the most appropriate sample of target language for LSP instructors and students.

Among some of the examples of corpus-based materials or corpus-based curricula for LSP, the most frequent cases are in the teaching of business English or legal English, particularly in the teaching of writing. Curado Fuentes (2002) introduced the analysis of a business English corpus through language-learning tasks. He collected and analyzed a representative corpus of English for business science and technology, selecting the texts that satisfy topic interests that follow university and professional curricula and which match the types of skills that need to be highlighted in the ESP context. His corpus covered a wide variety of genres, from business research papers and textbooks to reports of products and sales, as well as samples from other written and oral genres such as conference abstracts, electronic discussions, and technical reports. He conducted lexical and grammatical analyses on the corpus and used the results of those analyses as the source of information for his curriculum development, designing materials and activities that reflected his findings. Another application of business language exploration through corpora analysis is presented by Popescu (2007) in her attempt to design materials and activities to teach business collocations using concordancing lines from different corpora (including the British National Corpus and the Business Letter Corpus) in a comparative manner, and dictionaries, and even encouraging students to create their own business letter corpora. Popescu emphasizes the importance of adapting corpus-based LSP vocabulary materials to the students' level of proficiency, always trying to design authentic, real-life tasks. In a similar manner, Weber (2001) suggests the use of concordancers to help raise students'

awareness of the use of the generic and structural features frequently occurring in legal essays. Weber describes a wide variety of concordancing activities designed for a writing course for law undergraduate students at the University Center in Luxemburg. In another study, Mudraya (2006) describes how she used the findings of the analysis of the Student Engineering English Corpus (SEEC) to create materials and activities to teach vocabulary and collocation in the LSP class by means of the use of concordancers and the exploration of word frequencies and concordancing lines for the teaching of language in general and LSP in particular. Pinna (2007) illustrated the whole process of the collection and use of corpora to create materials for LSP teaching, starting with the collection of a corpus of oral implantology that was used by this author as a language-learning resource for students of dentistry who specialized in that subfield. He presented a wide variety of corpus applications to the LSP classroom and the exploration of this specialized corpus to expose the students to the typical contextual associations of words and terms that make up the complex skills possessed by experts in this specific type of discourse.

Perhaps the most comprehensive study of the application of corpora and corpus-based tools to the teaching of LSP, particularly of English for specific purposes (ESP), is the one by Gavioli (2005). Her book clearly identifies the advantages of collecting corpora for materials design and the different uses that can be made of those corpora in the classroom. Her work is based on two small corpora specially collected for curriculum design: a medical corpus made up of research papers in six subfields in that discipline and a corpus of economic-political texts, which were meant to help students familiarize with issues related to the European Community. Gavioli explains that working with small corpora may be problematic because this type of corpus only provides partial descriptions of the specialized languages under consideration, but she stresses the importance of using corpora in LSP teaching as she considers this field to be a "particularly suitable area for corpus-based teaching and learning" (p. 14). Her approach to the use of corpora in ESP develops around preparing students to become language analysts, exploring corpora by means of concordancers, and guiding them in the process of data analysis and towards what type of linguistic phenomena to focus on while conducting that analysis. Gavioli also introduces a series of language experiments carried out by ESP students who worked with specialized and nonspecialized corpora trying to find solutions to problems connected to their own learning of the language.

As previously mentioned, many curricula developed for the teaching of LSP focus on courses of LAP and reflect the analysis of academic-related genres such as the book review, the research article, or university lectures, both for target language analysis and for materials design. Flowerdew (1993b) explains the advantages of the different uses of concordancing in course design. He presents a case study of a course designed in the Language Center at Sultan Qaboos University in Oman. This foundation course was developed for science students at this English-medium university. In the scenario presented by Flowerdew, science and English are taught in parallel, and the English course bases its materials on the science course. The English course was "developed around the language and communicative activities students are exposed to in science" (p. 232). A corpus was then created consisting of transcriptions of the biology lectures that students received and readings in science, and it was analyzed by means of concordancing software for word frequencies in search of specialized and semi-specialized vocabulary. These frequency data were then used as criteria for syllabus selection and grading and for comparison with frequencies from a nonspecialized corpus. The results of the use of the concordancer helped to identify which uses of items to teach and provided examples that were directly incorporated into the instructional materials. Flowerdew presented a complete unit developed following this corpus-informed approach, which was used in the course described in his article.

Several course curricula and materials designed for LAP have originated in the analysis of MICASE. Pérez-Llantada (2005) discussed the role of corpus methodologies in providing information on frequency variability, linguistic patterning, and functional behavior of words in ESP lecture comprehension and how corpora help ESP practitioners investigate real language use to make informed decisions about teaching priorities. Based on findings from the same corpus, Neely and Cortes (2009) provide a variety of corpus-based materials aimed at raising students' awareness of the use of a group of lexical bundles, which are defined as groups of three or more words that frequently occur together, as discourse organizers in academic lectures.

Two very comprehensive and groundbreaking articles that present corpus-based curricula for the LAP writing class are Lee and Swales (2006) and Cortes (2007). Lee and Swales describe an experimental corpus-informed EAP course for doctoral students, in an approach that they called "technology enhanced rhetorical consciousness-raising" (p. 72), presenting students with knowledge and tools needed to work with expert corpora in order to examine these corpora in search of lexico-grammatical and discourse patterns. Students in this course used specialized corpora of academic writing and speech (MICASE, the Research Article Corpus, and academic texts from the British National Corpus) and they were taught to use online and computer-based concordancers in order to analyze the corpus for self-learning. Students were also instructed to compile their own corpora made up of their own writing and expert texts in their disciplines. These authors included an overview of the course structure, the linguistic and discourse phenomena examined in the course, together with a description of its advantages and disadvantages as reported by both learners and instructors. The results of the interviews conducted to receive feedback on the course design and application confirmed that the participants found the use of corpora in the classroom empowering, and they could see the advantages that the use of corpora presented over the use of reference or grammar books.

In a parallel-designed course, Cortes (2007) presents a genre-based and corpus-based class designed for advanced international graduate students. The course intertwined both top-down and bottom-up approaches to the analysis of a corpus through data-driven learning activities. Students' analysis of the especially collected corpus of research articles in their academic disciplines was guided by a set of readings extracted from research studies in applied linguistics that students used as a framework of reference for their own exploration of the corpus. They used specially designed concordancing software to analyze recurrent linguistic features in the genre, and introspective analysis of the different sections of the research article to identify the communicative purposes of those sections.

It is expected that the use of corpora in the analysis and description of varied registers in years to come will continue yielding findings that can be directly transferred to LSP teaching materials and curriculum design. As with other language-teaching areas that have started using corpora, LSP will definitely benefit from the advancement of computers and the use of these advancements in the exploration of more and more varied specialized language corpora.

Corpora: Chinese-Language

WINNIE CHENG

Introduction

Chinese corpus linguistics has made rapid developments over the last decade in the areas of corpus building, exploration in information technology, and publicly available corpus resources, and has introduced various practical applications, primarily in education and research. Chinese corpus construction work began in the 1920s (Feng, 2001; Zhan, Chang, Duan, & Zhang, 2006) when Chinese printed texts, with Chinese characters as the basic unit, were collected manually and the frequencies of Chinese characters were counted by hand to examine statistical data in order to understand the actual usage of Chinese characters in real-world contexts. The quantitative findings contributed to the compilation of Chinese textbooks to help primary school children to read and write Chinese characters. Between the 1980s and the early 1990s, Chinese sentences were segmented into word sequences by hand with the aid of computers for frequency counts of Chinese characters, and Chinese corpora were used to compile Chinese dictionaries, select the most frequently used words for Chinese textbooks, and draft the specifications for Chinese word segmentation (Zhan et al., 2006). From the mid-1990s, Chinese corpora were annotated and no longer confined to written text material but included spoken Chinese (Zhan et al., 2006).

Chinese speech and text corpora are increasingly important for the research and development of word segmentation and the practical applications of word segmentation in information retrieval and part-of-speech tagging, automatic speech recognition, text-to-speech conversion, natural language processing, and learning and teaching (e.g., Li & Xu, 2005; Emerson & O'Neil, 2006). Two such examples are the Chinese–English Parallel Corpus (Chang, 2004) and the Chinese Interlanguage Corpus (Zhan et al., 2006).

The Chinese–English Parallel Corpus, with over 20 million characters of Chinese texts of different types and corresponding English texts, contains texts from the Internet covering a range of domains including newspaper articles, technical articles, literature, and movie scripts (Chang, 2004, pp. 283–84). The parallel corpus is annotated in three ways: global textual attributes, monolingual textual structural annotation, and parallel alignment annotation (p. 284), and has been used in the development of a monograph-oriented machine-aided translation system, a contrastive study on Chinese and English passive form, and bilingual dictionary compilation (p. 290).

The Chinese Interlanguage Corpus, developed by the Beijing Language and Culture University in 1995, contains 5,774 Chinese compositions and other exercises written by 1,635 foreign students from 96 countries and regions learning Chinese in nine universities in Beijing and other cities (Zhan et al., 2006). The corpus was annotated to reveal errors such as incorrectly used Chinese characters and words, and ill-formed sentences. It provides useful information to Chinese language teachers and textbook editorial teams and so promotes effective learning of Chinese.

Chinese Corpora for Linguistic Studies

Chinese corpora have been used as resources for the studies of the Chinese language and cross-linguistic comparisons of English and Chinese (McEnery & Xiao, 2004), focusing on the linguistic aspects of lexis, grammar, semantics, pragmatics, phonetics, and phonology.

Corpora are most commonly used for lexical development, particularly in lexicography (Emerson & O'Neil, 2006). As Chinese words, unlike in many other languages, are not identifiable by spaces, it is problematic for natural language processing (NLP) applications that operate on this basis for purposes of information retrieval and data mining. As a result, researchers working with Chinese corpora have focused on word segmentation using a variety of methods, for instance using existing lexica to form "the core of a tokenization tool" (Emerson & O'Neil, 2006, p. 43). The English–Chinese Parallel Corpus (1 million English words and two million Chinese characters) has been analyzed to support the learning of lexis (Wang, 2001). The adverb *xianzai* ('now') was analyzed by eight Chinese students who noted that 'now' can also be translated as *muqian* ('in front of eyes'), *cike* ('this moment') and that 'now' is also used to draw attention: *wei* ('well' or 'listen') and *haole* ('all right') (Wang, 2001, p. 182).

Deng (2005) looked into the verb/noun collocation behavior of Chinese students, by comparing the Chinese Learner English Corpus (CLEC) with the Brown Corpus of Written American English (Brown) and the Lancaster–Oslo–Bergen Corpus of Written British English (LOB). Deng (2005) examined 'learn', 'gain', and 'success' and found collocates used by Chinese students differed greatly from those used by native English speakers, both in frequencies of occurrence and collocational patterns. For instance, Chinese students used 'learn' much more frequently, and despite similar collocates of 'learn . . . a subject/a language/ something', Chinese learners used 'learn . . . knowledge/technology/experience/skills' which are not found in the Brown or LOB corpora (p. 759). The unique usages were found to be due to "mother tongue interference" (p. 760).

A spoken corpus, composed of both non-face-to-face talk on the Electric Bulletin Board System (BBS) and face-to-face daily conversation mainly produced by young people in Taiwan, was analyzed to explore the lexical, grammatical and discourse functions of *shuo* 'say' (Wang, Katz, & Chen, 2003, p. 457). The study explored the grammaticalization of *shuo*, triggered by metaphorical and pragmatic extension, by drawing on the general tendencies of semantic change proposed by Traugott (1982, 1989), namely grammaticalization will proceed from the propositional (i.e., objective, ideational) to the textual and to the expressive (i.e., subjective, speaker-based) level, but not in the reverse direction (Wang et al., 2003, p. 481). Wang et al. (2003, p. 483) found that *shuo* in Taiwan Mandarin is going through the semantic changes suggested by Traugott. The lexeme *shuo* changes from the propositional level, where it is a verb meaning 'say' that "prefaces an utterance conveying information," to the expressive level, where it functions as a discourse marker, and "encodes the attitude of the speaker toward the proposition" (p. 458). The corpus-based study found that *shuo*, in addition to serving as a complementizer, can also "occur in an utterance-initial position, functioning as a marker of hearsay, and in an utterance-final position, as a marker of counterexpectation or as an intensifier" (p. 457).

A study in Hong Kong compared an existing Chinese synonym dictionary, the *Tongyici Cilin*, with lexical items from the finance and economic news domain from a contemporary Chinese corpus, the Linguistic Variation in Chinese Speech Communities (LIVAC), to "investigate the commonalities and uniqueness of the lexical items used in various communities . . . and to evaluate the adequacy of the *Tongyici Cilin*" (Kwong & Tsou, 2006, p. 325). The *Tongyici Cilin* contains 70,000 lexical items. It was first published in the 1980s based exclusively on Chinese as used in post-1949 Mainland China (p. 324). The LIVAC contains "newspaper articles collected regularly and synchronously from six Chinese speech

communities, namely Hong Kong, Beijing, Taipei, Singapore, Shanghai, and Macau" (p. 325). The study found that 23–40% of the candidate words from various subcorpora are unique to the individual communities and 70% of them are not covered in *Tongyici Cilin* (p. 331). Analysis of the LIVAC shows the highest word usage similarity between the Macao and Hong Kong varieties, followed by Hong Kong and Taiwan, and Hong Kong and Singapore and the lowest word usage similarity between Shanghai and Hong Kong (Feng, 2006, p. 193). It also shows fewer different words (types) used in Singapore and more different words (types) used in Shanghai, probably because "Singapore Chinese language is not the exclusive language in the local social life, whereas Shanghai has a special position in China and the economic activities are extremely active" (Feng, 2006, p. 193).

Using two comparable corpora: the Freiburg–Lancaster–Oslo–Bergen Corpus (FLOB) (1991) and the Lancaster Corpus of Mandarin Chinese (LCMC), Xiao, McEnery, and Qian (2006) studied not only passive constructions in British English and Mandarin Chinese, but also "more fine-grained genre distinctions between the two languages" (p. 110). Analyzing both spoken and written data, their study shows that although passive constructions in both English and Chinese display "a basic passive meaning," they are different in terms of "overall frequencies, syntactic features and functions, semantic properties, and distributions across genres," due to distinguished features of English and Chinese respectively (p. 146). The study also demonstrates that methodologically "comparable monolingual corpora provide a useful tool for contrastive linguistics" (p. 146).

In another study, *gei* ('to give') constructions in Mandarin Chinese and *bei* ('to give') constructions in Cantonese in three corpora of spoken and written Chinese and Hong Kong Cantonese were compared (Wong, 2009). The three corpora were the LCMC (written Mandarin), the CallHome Mandarin Chinese Transcripts Corpus (spoken Mandarin), and Hong Kong Cantonese Adult Language Corpus (HKCAC) (Cantonese) (Wong, 2009, p. 62). The main findings included: (a) in English and Mandarin Chinese, the order of indirect object followed by direct object reverses in Cantonese; (b) compared to Mandarin *gei* constructions, a lower incidence of Cantonese *bei* constructions co-occurring with a verb phrase; (c) when compared with *gei*, Cantonese *bei* is more commonly used as a passive marker and as a verb meaning 'allow'; and (d) *bei* occurs in a set phrase, but *gei* does not (p. 77). As Wong (2009) remarked, the study provided "pedagogical implications for Cantonese speakers learning Mandarin and Mandarin speakers learning Cantonese" and contributed to "the dichotomy between what a language and a dialect are thought to be and how they actually behave linguistically" (p. 77).

Previous studies on aspect in Chinese were mostly intuition-based, that is, not attested with corpus data (Xiao & McEnery, 2004, p. 4). Adopting a corpus-based approach, Xiao & McEnery (2004) studied both situation aspect and viewpoint aspect markers in Mandarin Chinese. They examined five corpora: two monolingual corpora of Mandarin Chinese (The Weekly Corpus and the LCMC), two English corpora (the FLOB Corpus and the Freiburg–Brown [FROWN] Corpus), and an English–Chinese parallel corpus (E–CPC). Their study identifies eight viewpoint aspect markers and discusses the characteristic features of them in great detail.

The LCMC was examined by Siewierska, Xu, and Xiao (2010), in combination with the Lancaster–Los Angeles Corpus of Spoken Chinese (LLCSC) which contains two million words of authentic spoken and written Chinese data, to study the interaction of splittable compounds (SCs) with morphology, syntax and pragmatics. Siewierska et al. (2010) found that "the typical grammatical pattern of SCs is constitutive of an aspect marker (*-le*, *-zhe*, *-guo*) or resultative verb complements as post-verb adjacent elements (54% of all SCs), and a quantifier, a classifier, a modifier or a combination of two or more of them which precede the nominal components of SCs" (p. 464).

Shei (2005) examined features of fixedness in phraseology and textuality in the genre of Web-based news reports on fire incidents in Chinese. The study investigated collocations, extended lexical units (Stubbs, 2002), that is, lexical units larger than collocations, and textual cohesion, based on extended lexical units spanning the text. The study proposed a script model for the Chinese and English newspaper reports which analyze fire news in terms of place, time, event, process, result, cause, and update (Shei, 2005, pp. 215–16). Shei (2005) concludes that “different degrees of fixedness can be observed from corpora of different sublanguages, with distinctive patterns of lexical units or lexical priming effects recognisable for each” (p. 216).

Ambiguity in Chinese discourse can be found at the four levels of “lexical, syntactic, semantic (referential ambiguity), and pragmatic” (Wang, Chen, & Hsu, 1998, p. 467). This study focused on semantic and pragmatic ambiguity that involves ellipsis and anaphora. Wang and colleagues applied an event-based parser and successfully solved about 90 percent of the 300 mathematics-based word problems experienced at elementary school in Taiwan (p. 471). An event is “an activity or state expressed by a sequence of words” (p. 466), and the event-based approach views the underlying structure of a discourse as an event sequence rather than a parse tree. Wu, Jin, Zhang, and Yu, (2006) also tackled the issue of disambiguation and constructed a semantic sense-tagged Chinese corpus, aimed at enhancing “word sense disambiguation and research on Chinese lexical semantics” (p. 420).

Wang and Tsai (2007) investigated Chinese conjunctions/contrastive markers across four different text types—casual conversations (informal dialogues), narratives of personal experiences (informal monologues), formal interviews (formal dialogues), and formal lectures (formal monologues)—in a spoken corpus. Their study found that the use of the Chinese contrastive markers *zhishi*, *buguo*, *danshi*, and *keshi*, which “correspond to English ‘but/ yet/however’” exhibit “a range of attitudinal, cognitive and interactional properties” (p. 1775). *Zhishi* is usually used to express an afterthought, *buguo* to change the topic, *danshi* to emphasize or make a point, and *keshi* to denote an implicit contrast (p. 1775). In terms of frequencies of occurrences, the study found that *danshi* occurs more often in formal monologues, *buguo* in formal dialogues, *keshi* in informal speech situations, and *zhishi* in informal dialogues. In terms of functions, *zhishi*, *danshi*, *buguo*, and *keshi* are lexical conjunctions that express “a topic-internal contradiction” (p. 1775). In addition to this function, *danshi*, *buguo*, and *keshi* function to “introduce a new topic and to mark a dispreferred response” (p. 1775).

Similar to Wang and Tsai (2007), Chang (2008) examined a mini spoken corpus containing approximately 11 hours of conversations among native speakers of Taiwanese Southern Min to explore the syntactic patterning and semantic-pragmatic functions of contrastive markers. Recurrent patterns of contrastive markers in discourse can be attributed to “sequentiality, communicative intent and the dynamics of interaction” (p. 2114). The position of the contrastive marker is related to the function of the contrastive marker, namely when the contrastive marker is placed near the clause matrix, it is more likely to be used for propositional contrast; otherwise, the contrast marker is likely to take on metalinguistic interpretation. The study contributes to linguistic research by providing a “systematic analysis of the syntactic configuration and the discourse functions” (p. 2145) of contrastive markers and serves as a pioneering study on the grammaticalization of *sikong* as a conjunctive contrastive marker in Taiwanese Southern Min conversations.

Idioms and metaphors have been investigated in Chinese corpora. Hsieh (2006) examined the Corpora of Animal Expressions in Mandarin and German, using the notion of ‘semantic molecules’ which are “composed of ‘primitive semantic features’” (Goddard, 1998, p. 247). Hsieh (2006) studied the semantic molecules of *Cat* expressions and found that the “salient semantic molecules of cat are ‘weak’ in Mandarin Chinese and ‘weak, false, small, unimportant, flattering, quick, shrill’ in German” (p. 2206). The study explored the “semantic

interaction and the cultural backgrounds within the form of society" (p. 2206) to explain these findings.

Other corpus-based studies investigated Chinese phonetics and phonology (Tseng, 2005) and the interaction between phonology and syntax and discourse (Wang, Yang, & Lu, 2006; Wang, Lin, & Li, 2009). Tseng (2005), for instance, examined the Mandarin Conversational Dialogue Corpus (MCDC) consisting of 30 one-hour Mandarin spontaneous dialogues in Taiwan to investigate linguistic characteristics of syllable contractions in spontaneous Mandarin which "are more or less unexplored in Mandarin phonetics and phonology" (p. 64). The study found that open syllables following open syllables, rather than closed syllables, are likely to be contracted, and that the most frequent syllables, that is function words, which lack semantic content and are less prominent in phonetic realization, tend to be contracted (p. 81). Tseng (2005) showed that corpora of spontaneous speech could be used to "empirically [confirm] linguistic theories" and to explore "unknown linguistic phenomena" (p. 81).

In another study, a Chinese Putonghua (Mandarin) spoken corpus consisting of 10 monologues was rated by 25 participants on a 5-point scale in terms of the Perceived Boundary Strength (PBS) of discourse units, namely clauses (intonational phrases), sentences, and paragraphs (Wang et al., 2006). The main results include: (a) a significant difference in the PBS of clauses, sentences, and paragraphs, but a similar PBS between simple and compound sentences; (b) the pitch-based cue for distinguishing clauses, sentences, and paragraphs appears to be both the pitch of the pre- and post-boundary syllables and the pitch difference between them; (c) declination occurs within clauses; and (d) pauses are "longer and more varied at larger units" (p. 358).

Using a corpus of 973 spontaneous telephone conversations, Wang et al. (2009) studied the pitch of spontaneous speech in Chinese Putonghua. Analyzing 1,084 intonation phrases, Wang et al. (2009) found a great variability in the pitch range and pitch register of intonation phrases (IPs) in spontaneous speech, showing that the pitch range of IPs at the start position of an exchange is inclined to be great and at the end position small. They also found that compared to university students reading aloud, in spontaneous telephone speech the pitch range of IPs is small but the pitch is more variable (p. 190).

Conclusion

Looking to the future, Chinese language corpora are likely to make improvements in two main areas (Zhan et al., 2006): first, there should be a common standard for annotating Chinese corpora due to the lack of morphological cues in Chinese; second, Chinese language corpora could be made more widely available to both scholars and the public with the advances made in information technology. Chinese language corpora are important resources in a number of important ways, including lexicography (and in the case of Chinese-English corpora, bilingual lexicography), Chinese language information processing, the tracking of changes in the Chinese language, the production of dictionaries and other reference materials, the development of aids to translation, language teaching materials, the study of many aspects of linguistic behavior, such as vocabulary, grammar, semantics, pragmatics, phonetics, and phonology, the study of register variation, and natural language processing (e.g., Tognini-Bonelli, 2001; Hunston, 2002; Chang, 2004). Chinese language corpora promise to be increasingly important in the future.

Corpora: English-Language

SEBASTIAN HOFFMANN

Introduction

This entry provides an overview of a selection of electronic language corpora that are available for the study of English at the time of writing (early 2010), including information about their availability and pricing as well as any specific corpus tools that are required to access the data, where applicable. Before taking a look at individual corpora, a few introductory comments are in order.

First, it is useful to distinguish two senses in which the word “corpus” is used. The more conventional sense is the one described by Sinclair (1996): A corpus “is a collection of pieces of language that are selected and ordered according to explicit linguistic criteria in order to be used as a sample of the language.” In other words, a corpus is a carefully crafted compilation of instances of authentic language use rather than just any large number of electronically stored texts. In recent years, however, some linguists have started to take a more generous view of what constitutes a corpus. This particularly refers to the whole range of data that is available in virtually limitless quantities on the Internet, but it also applies to specialized electronic text archives (e.g., of literary texts or newspapers) and electronic dictionaries (e.g., the *Oxford English Dictionary*). While such data sets no doubt represent interesting sources of data, the present overview will use the more conventional definition and concentrate exclusively on traditional corpora that are compatible with Sinclair’s definition given above.

Second, since specialized corpora are treated in a separate entry, this overview will be restricted to what is commonly termed “general corpora.” This label refers to a balanced collection of electronic texts that is intended to be representative of the whole range of language contexts available to speakers of a particular language variety (e.g., British or Australian English). For very large general corpora, the term “reference corpus” is sometimes used. While some general corpora cover both spoken and written data, the term is also applicable if only one of the two modes is represented.

Third, it must be stressed that the brief descriptions of corpora offered here are no more than introductory in character. Since no fully objective criteria for corpus representativeness exist, reliable interpretations of the linguistic patterns observed in the data greatly benefit from a full awareness of the sampling strategies employed by the corpus compilers. Readers are therefore invited to consult as much additional information as is available for the corpora before using them to conduct serious research. A useful resource for this purpose is the Corpus Resource Database (CoRD—see <http://www.helsinki.fi/varieng/CoRD/index.html>), which provides first-hand information on a range of English-language corpora; all information was submitted or approved by the compilers of each corpus.

Finally, a compact overview of this type must necessarily be selective in its coverage. As a matter of course, the omission of a general corpus should not be seen as an indication that it would not be a useful resource for the study of the English language. A more complete and annotated overview of corpus resources can be found in Lee (*n.d.*).

Overview of General Corpora

British National Corpus

The British National Corpus (BNC—see www.natcorp.ox.ac.uk; Burnard, 2007) was created to be a balanced reference corpus of late 20th-century British English. It contains almost 100 million words, about 10% of which are transcriptions of spoken data. All in all, the BNC consists of over 4,000 text samples of varying length (ranging from a few hundred words to several tens of thousands of words). All texts were automatically part-of-speech tagged with CLAWS (see <http://ucrel.lancs.ac.uk/claws/>; Garside, 1987), making use of the C5 tag set (also known as the “BNC Basic Tag Set”). In addition, all word forms in the corpus are associated with their corresponding headwords (e.g., *GIVE* for the verb forms *give*, *gives*, *gave*, *given*, and *giving*).

The texts to be included were selected according to specified selection criteria in order to mirror the language of the time. For the written component of the corpus, these criteria were “text domain” (e.g., world affairs, leisure, arts), “time period” (mostly 1985–93, but including some older texts dating back as far as the 1960s), and “medium” (e.g., book, periodical). For the spoken component, two separate strategies were employed. On the one hand, a selection of about 150 recruited speakers recorded all their conversations over a given period of time. The selection of these so-called respondents was based on socio-demographic criteria (age, sex, social class, and geographical region) and mirrored the structure of British society at the time. The 4.2 million words recorded in this fashion form the demographically sampled part of the corpus (DS). In contrast, the 6.2 million words of the context-governed part (CG) were chosen to represent particular settings or contexts of language use, for instance meetings, radio broadcasts, lectures, and tutorials. Texts from four broad domains were selected in roughly equal proportions: “business,” “educational and informative,” “institutional,” and “leisure.” Unlike the DS part of the corpus, the CG part also contains monologues (approximately 25%). On the whole, the CG part of the corpus tends to represent more formal language use than the spontaneous conversations of the DS part; this difference is not categorical, however.

Once the material was selected, it was included in the corpus together with whatever supplementary information about it was available (e.g., age, sex, domicile of author or speaker, perceived level of difficulty, genre). The proportions of the corpus annotated with these descriptive features are thus accidental rather than the result of the corpus compilers’ conscious objectives to mirror general language use as closely as possible. For example, about 70% of CG is produced by men, while in DS an equal proportion of words is spoken by women and men.

The transcription of the spoken data is fairly broad and purely orthographic, but it includes such metatextual information as indications of pause length, overlap of speakers, and speech quality (e.g., whispering). No prosodic information is available. Some of the original tape recordings were deposited with the British Library, and at the time of writing a project is under way that will prepare and release the sound recordings of the demographically sampled part of the corpus to the public. Significantly, the project also involves alignment of the transcription with the sound.

Since its first release in 1995, the BNC has been revised twice. No new texts were added to the corpus, but some known errors were fixed (e.g., duplicate texts removed) and the annotation of metatextual information was improved. The texts of the third edition of the corpus (released in 2007) are formatted in XML. The corpus can be searched with a variety of tools. It is distributed with XAIRA (see xaira.sourceforge.net), an open-source corpus tool that can also be used to search other corpora in XML format. An alternative is offered by BNCweb (see bncweb.info), a web-based interface integrated with the

powerful CQP query software (see Hoffmann, Evert, Smith, Lee, & Berglund Prytz, 2008). There are also a number of free web-based services available that offer restricted access to the corpus (e.g., with limited context of query results); these include Mark Davies's BYU-BNC (see <http://corpus.byu.edu/bnc>) and Bill Fletcher's Phrases in English or PIE (see <http://phrasesinenglish.org/>).

The BNC is distributed by the University of Oxford. A personal license is priced at £75 while an institutional license costs £500 (plus VAT, if applicable). Two smaller subsets of BNC texts, BNC Baby (4 million words) and the BNC Sampler (2 million words) are available through the same channels.

Corpus of Contemporary American English

For over a decade, no corpus of American English existed that could match the BNC as regards size and range of data. In the year 2008, this gap was to a large extent filled by the Corpus of Contemporary American English (COCA—see www.americancorpus.org; Davies, 2009), a balanced corpus containing over 400 million words of both spoken and written data. In contrast to the BNC, the contents of COCA are not fixed but updated on a twice-yearly basis, adding approximately 20 million words every year, thus making it possible to investigate very recent developments in American English. A further difference to the BNC is that virtually all texts in COCA are complete texts rather than text samples of varying sizes. The texts in the corpus were automatically part-of-speech tagged with CLAWS. The tag set that was used is the more detailed C7 tag set (see <http://ucrel.lancs.ac.uk/claws7tags.html>); however, since both COCA and the BNC were tagged with the same tagger, it is still possible to compare tag-based findings across these data sets.

Like the BNC, COCA contains a range of different domains or genres, but the choice of categories and their proportions are somewhat different, covering the five genres of spoken, fiction, popular magazines, newspapers, and academic journals in equal quantities. For each of these genres, care was taken to balance their contents not only overall but also for each year. For example, the genre "popular magazines" contains data from almost 100 different sources that cover a large range of different topics and target audiences, including news, health, home and gardening, women, finance, religion, and sports. Similarly, the texts for the "academic journals" genre are taken from the entire range of the Library of Congress classification system, and again this applies as far as possible to each individual year for which data were collected. An Excel spreadsheet containing detailed information about the composition of the corpus can be downloaded from the COCA Web site (see <http://corpus.byu.edu/coca/files/texts.zip>).

Since sampling strategies and selection criteria can vary considerably, it is always a somewhat problematic exercise to compare findings from different corpora. The COCA genre for which direct comparability with BNC data is potentially most challenging is the spoken data. This is because all spoken texts are derived from transcripts of unscripted conversation on TV and radio programs (e.g., *Newshour* [PBS], *Good Morning America* [ABC], *Today Show* [NBC], and *Larry King Live* [CNN]). Although there can be little doubt that these interactions are indeed relevant examples of spoken interaction, their nature is necessarily different from the carefully compiled and demographically sampled set of spontaneous conversations in the spoken component of the BNC. For researchers whose focus is primarily on spoken interaction, the use of additional American sources (e.g., the Santa Barbara Corpus, see below) is therefore recommended to reduce the danger that findings may be significantly influenced by issues relating to corpus compilation rather than by actual differences between British and American English.

For copyright reasons, COCA cannot be distributed to users but is exclusively accessible through its Web-based interface. This tool offers the typical features of a concordancer,

including flexible ways of restricting searches to individual sections of the corpus (e.g., time spans or genres) and displaying results in tabular and graphical formats. The display of the immediate context of search results is restricted to a few words before and after the query match. While this will have no impact on a large range of research questions, this limitation may nevertheless at times be frustrating for users wishing to investigate corpus findings in a more qualitative way (e.g., to conduct research on pragmatics).

The Bank of English

Like COCA, the Bank of English is a corpus whose contents are not static but instead updated on a regular basis. Its compilation was started in the 1980s under the direction of John Sinclair as part of the COBUILD (Collins Birmingham University International Language Database) project, resulting in a corpus of initially 8 million words of English text. In forming the basis for the *Collins COBUILD English Language Dictionary* (1987), it set the stage for a new approach to lexicography and dictionary making that was explicitly corpus-based. Since then, the Bank of English has grown to a size of over 500 million words, containing data from a wide range of sources (written and spoken) from eight different (native) varieties of English. The corpus is available to subscribers as part of Collins WordbanksOnline (see <http://www.collinslanguage.com/wordbanks/default.aspx>) via a Web-based interface (from £695, excluding VAT; free one-month trials are available). A 56-million word subset of the corpus can be accessed for free, but the output is restricted to a maximum of 40 concordance lines.

The Brown Family of Corpora

The three general corpora presented so far belong to a category that is often referred to as “mega-corpora.” However, there are a number of smaller corpora that also clearly deserve the label “general corpus.” A set of these is known as the Brown family of corpora, whose name derives from the very first electronic corpus of English, the Standard Sample of Present-Day American English, later simply known as the Brown Corpus, referring to the university where it was compiled (Francis, 1965; Francis & Kučera, 1979). It consists of 500 written text samples of 2,000 words dating from the year 1961, thus 1 million words. For the selection of texts, the compilers applied a sampling frame that was intended to capture a very wide range of (written) language use: The corpus is divided into two major parts, termed “informative” (approximately 75%) and “imaginative” (approximately 25%), which are in turn subdivided into a total of 15 different genres of varying proportions (e.g., press: editorial, popular lore, romance, and love story). The actual text samples to be included for each section were chosen randomly, for instance from a list of all available publications in a particular subject field, rather than based on any text-internal criteria.

About a decade later, the Brown Corpus was twinned by a matching selection of texts of British English dating from the year 1961, the 1-million-word Lancaster–Oslo–Bergen Corpus (LOB; Johansson, Leech, & Goodluck, 1978), to permit direct quantitative comparisons of written English as it is used on both sides of the Atlantic. In the early 1990s, a team at Freiburg University, Germany, then compiled two further analogues of the original Brown Corpus, the Freiburg–Brown Corpus (abbreviated Frown; Hundt, Sand, & Skandera, 1999) and the Freiburg–LOB Corpus (abbreviated FLOB; Hundt, Sand, & Siemund, 1998) containing texts from 1991 to 1992. The Brown family of corpora thus makes it possible to investigate and compare recent language variation and change in British and American English over a period of 30 years.

All four corpora are distributed on the ICAME CD-ROM at a cost of NOK 3,500 (approximately €440 in spring 2010) for individual users and NOK 8,000 (approximately €1,000) for institutional licenses. The CD-ROM contains a range of other English-language

corpora, some of which are also mentioned in the present overview. The corpora are in a simple text-only format, with minimal mark-up using simplified SGML tags (e.g., indicating paragraph boundaries or foreign words) in the case of Frown and FLOB, and can thus be searched by means of standard corpus tools (e.g., AntConc [see <http://www.antlab.sci.waseda.ac.jp/software.html>] or WordSmith Tools [see <http://www.lexically.net/wordsmith/>]). The Brown Corpus is also distributed in XML format on the BNC Baby CD (see above). Finally, both the Brown Corpus and LOB are also available in part-of-speech tagged format on the ICAME CD-ROM (see <http://icame.uib.no/newcd.htm> and <http://khnt.hit.uib.no/icame/manuals/>).

Three further corpora modeled on the Brown format were compiled for different varieties of English: the Kolhapur Corpus of Written Indian English (Shastri, 1986), the Australian Corpus of English (ACE; Peters, *n.d.*), and the Wellington Corpus of New Zealand English (Bauer, 1993), containing data published in 1978 (Kolhapur) and 1986 (ACE and Wellington) respectively. Furthermore, at the time of writing, several projects are under way or have recently been completed that extend the Brown family of corpora to include both older and more recent data sets. Thus, there are now two additional corpora for British English: BLOB-1931 (for “before LOB”; Leech & Smith, 2005), containing material published around the year 1931, and BE06 (Baker, 2009), consisting of a comparable set of texts from the year 2006, the latter compiled from Internet sources. These corpora are currently not publicly distributed; however, it is anticipated that BLOB-1931 will become available soon via a Web-based search interface. Text collection for 1901 British and 1931 American analogues is still in progress.

By the standards of the early 21st century, the size of the Brown family of corpora is relatively small. However, given their virtually exact match in terms of sampling frames, they nevertheless represent highly valuable sources of data, particularly where medium- to high-frequency phenomena are concerned.

International Corpus of English

One further set of small-scale corpora deserves mention in the current context: the International Corpus of English (ICE—see <http://ice-corpora.net/ice>). Its aim is to provide researchers with a collection of 1-million-word comparable corpora of more than 20 varieties of English worldwide. However, each of its components is also designed to be a general corpus of its variety in its own right. Each corpus is compiled following the same strategies; again, 500 text samples of 2,000 words each are included. In contrast to the Brown family of corpora, however, ICE corpora contain 60% of spoken material. At the time of writing, about half the corpora are publicly available, including data sets for four native varieties of English (Canada, Great Britain, Ireland, and New Zealand).

All ICE corpora follow the same annotation scheme, involving for example markup for overlapping speech, foreign or indigenous words, and typographic features such as bold-face font and underlining. In addition, all corpora will eventually be part-of-speech tagged with the same automatic tagger, thus improving the opportunities for comparing the use of grammatical structures across different varieties. Furthermore, ICE-GB has already been syntactically parsed at the phrase, clause, and sentence level.

The majority of available ICE components can be either downloaded free of charge from the ICE Web site (after submitting a signed license agreement), or accessed for a nominal fee from the corresponding ICE team. The exception is ICE-GB, with prices between about £350 and £750, depending on location and type of license; a single-user student license is available for £25, however. The original audio recordings for ICE-GB can be obtained for an additional £250–500. With the exception of ICE-GB and its complex syntactic-parsing annotation scheme, all ICE corpora can be searched with standard corpus tools. For ICE-GB,

the (Windows-only) tool ICECUP is provided to make full use of the grammatical information encoded in the corpus.

Spoken General Corpora

Since the transcription of conversation is a much more time-consuming task than collecting written data, the number of available general spoken corpora is fairly limited, and none exceeds even half the size of the 10-million-word spoken component of the BNC. For British English, the London–Lund Corpus (LLC; Greenbaum & Svartvik, 1990) is a widely used corpus containing approximately 500,000 words representing various types of spoken language (e.g., spontaneous face-to-face conversations or prepared monologues) recorded mostly during the 1960s and 1970s, but with a few texts dating as far back as 1953 and 11 texts recorded in the 1980s. Some of the recordings were made surreptitiously, without the knowledge of (at least some of) the people involved, which ensures a high level of authenticity of the material, but would no longer be allowed today.

The LLC is distributed on the ICAME CD-ROM. All recordings were carefully transcribed and contain detailed prosodic information. While this is no doubt a great asset for researchers of speech, the format makes a reliable search for individual words or phrases with a standard corpus tool next to impossible. As a case in point, consider the four lines below, reproduced from the LLC. The word *wiggle* occurs twice, but with different types of intonation, indicated by the word-internal symbols “\ /” (i.e., fall–rise) and “\” (i.e., fall), respectively. A search for *wiggle* with a standard corpus tool would match neither of these instances.

```
111b 37 8750 1 1 A 11 2^and !then . 'do a :w\iggle# - - /
111b 37 8760 1 1 A 12 2+^so as _to+ - ++^s/orry#+++ /
111b 37 8770 1 1 B 11 2+((it ^always !w\as#))+ /
111b 37 8780 1 1 B 11 2an ^old 'old ++w\iggle#+++ /
```

Various informal versions of the LLC stripped of its prosodic annotation exist, but it appears that only one of them is officially distributed (see DCPSE below).

For spoken American English, the readily available corpus data is sparse. The only general corpus of spoken interactions is the Santa Barbara Corpus (see <http://www.linguistics.ucsb.edu/research/sbcorpus.html>), with 249,000 words in 60 different texts. The data contain interactions from various regions in the USA; the majority of contributions appear to be by speakers of educated Standard American English. The corpus is distributed by the Linguistic Data Consortium in four separate volumes and includes the original sound files; prices for individual volumes range from US\$100 to US\$200 each. A much larger corpus is the Longman Spoken American Corpus, containing 5 million words of spontaneous conversations of more than 1,000 speakers from a diverse set of sociodemographic backgrounds. However, virtually no documentation exists and access to the corpus unfortunately appears to be restricted to Longman in-house use, where it is for example employed in the compilation and validation of modern grammars of English.

Diachronic Corpora

The final section of general corpora to be presented here deals with text collections whose contents are intended to represent language use from different time periods and are thus primarily suited for the investigation of language change. Perhaps the best-known of these is the diachronic part of the Helsinki Corpus of English Texts (or Helsinki Corpus for short; Kytö, 1996), which covers almost 1,000 years in the history of English (ca. 750 to ca. 1700). It contains 1,572,800 words in three major sections (Old/Middle/Early Modern

English), which are further subdivided into a total of 13 subsections. Most texts included are samples (2,000 to 10,000 words) rather than complete texts. In the selection of texts, the compilers took care to cover a wide variety of language use available through records from each time period; however, given the relatively small overall size of the corpus, the representativeness of individual registers within each section must necessarily be evaluated with caution. For many types of investigation, the Helsinki Corpus offers a convenient starting point that can then be complemented by research on the basis of more specialized corpora covering much shorter periods of time.

Each text of the Helsinki Corpus contains a header with detailed information relating to such parameters as geographical dialect, genre, and sociolinguistic features such as age, sex, and social rank of the author, if available. The file format allows searches with standard corpus tools; however, users need to be aware of the conventions employed to encode certain typical features of older manuscripts. For example, superscript is indicated with an equal sign (e.g., $y = t$ = for y^t) and letters such as ash and thorn are indicated with compound characters (e.g., + t for þ). The Helsinki Corpus is distributed on the ICAME CD-ROM.

For researchers wishing to investigate the full length of the history of English, the Helsinki Corpus can be complemented with ARCHER (short for A Representative Corpus of Historical English Registers—see <http://www.llc.manchester.ac.uk/research/projects/archer/>; Biber, Finegan, & Atkinson, 1994), which contains about 1.8 million words sampled from seven 50-year periods (1650–1990) covering nine different registers. A total of 70% of the corpus represents British English; for American English, only three time periods (1750–99, 1850–99, and 1950–90) are included, but plans are in place to fill the gaps in the American data in the near future. The files are in a simple text format and can be searched with standard corpus tools. ARCHER is maintained by a team of researchers involving 15 different universities. For copyright reasons, it is not publicly available; however, interested researchers can gain local access to the corpus at any of the 15 universities involved.

Given the ephemeral nature of speech, very few collections of historical spoken data exist, and even fewer data sets belong to the category of “general corpora.” There is one notable exception, though, involving major parts of two corpora that have already been mentioned here: the Diachronic Corpus of Present-Day Spoken English (DCPSE—see <http://www.ucl.ac.uk/english-usage/projects/dcpse/index.htm>). It consists of equal proportions of data from the LLC and ICE-GB, amounting to a total of about 875,000 words. Like ICE-GB, the texts from the LLC have been syntactically parsed, thus allowing direct diachronic comparisons of grammatical, and not merely lexical, features of spoken British English across a time span of about 30 years. The corpus can be searched with ICECUP; various licensing options are available and prices range from about £350 to £720; a student license is available for £25.

Finally, at the time of writing, a promising new source of diachronic data for American English was about to be released for public access: the Corpus of Historical American English (COHA—see <http://corpus.byu.edu/coha.asp>), a balanced collection of 400 million words covering the four genres of fiction, popular magazines, newspapers, and academic prose, and thus nicely complementing the present-day English data contained in COCA (see above).

Conclusion

The use of electronic corpora has had an enormous impact on the field of applied linguistics. Today's scholar can access large amounts of authentic language use by way of a few mouse clicks. Furthermore, sophisticated corpus tools have been developed that support both novices and experts in the field in their analysis of the patterns that emerge from the

data. In particular, English corpora have become increasingly influential in language teaching, both when it comes to informing the creation of modern pedagogical materials and when used as active tools in the classroom (see, e.g., Hunston, 2002; papers in Quereda, Santana, & Hidalgo, 2006).

As will be apparent from this overview of general corpora, researchers can select from a wide range of options to find the corpus that is best suited for answering a particular research question. However, it will also be clear that the selection criteria employed by the compilers of these general corpora vary quite considerably. Apart from the obvious difference between corpora incorporating spoken language, written language, or both, more subtle differentiations arise due to the choice and proportions of text types included. As already alluded to in the introduction, it is necessary for researchers to be thoroughly acquainted with the corpus that they are searching in order to make full sense of the patterns that can be observed. This is even more necessary if findings from different corpora are compared.

Fascinating new avenues of research are opening up in corpus linguistics due to the use of virtually limitless quantities of Internet-derived data. Still, for many types of applications, recourse to a data set that was compiled on the basis of principled decisions in order to be representative of a well-defined population of language users is recommended.

Corpora: French-Language

GEOFFREY WILLIAMS

Corpus linguistics arrived late in France, but electronic text archives arrived early. The apparent contradiction lies in the defining of corpora and of corpus linguistics. Interestingly, it was lexicography that would provide the impulse for this new tool for the study of language. The development of a new prestige dictionary led to the building of a large database of texts that is now available online. However, as everywhere the real development of corpus analysis came about with the development of personal computers and stand-alone concordancing tools. In France, two fields made the initial inroads into corpus analysis: spoken language studies and natural language programming (NLP). The latter is not our primary concern here as this entry will concentrate on corpus linguistics in terms of applied linguistics rather than in computational applications.

Initially corpus linguistics in France concentrated on spoken language, text corpus linguistics being essentially carried out in English for specific purposes. This has gradually changed as interest in the use of computers has spread to other fields of applied linguistics, notably in the teaching of French as a foreign language. France does not have a national corpus, but does have a plethora of small spoken corpora in addition to much-used literary and press resources. To understand French corpora, it is useful to have an insight into how and why French corpus linguistics developed, before looking at the different corpora available in the French-speaking world.

French Corpus Linguistics

Frantext and the Literary Tradition

What has become known as the “French exception” is a plea to recognize individual cultural values, and more particularly French ones, in an increasingly Anglo-Saxon dominated world; key to this is a strong defense of the French language and literature, as well as cinematographic traditions. This has had an important effect in educational fields where literature has been put on a pedestal as the paragon of correct usage. In countries which have a national academy, literature is a major reference point in deciding what is correct usage. This does not necessarily leave much room for a descriptive corpus linguistics approach that seeks to avoid imposing notions of acceptability and may be one reason why France still has no reference corpus. It also explains why the first major electronic archive was literary in bias.

In the pioneering postwar years, France realized very early on that computers would play a major role in the analysis of texts. As early as 1957, Paul Imbs, then at the Centre de philologie romane in Strasbourg, had planned a new dictionary for French that would be based on a large “corpus” of texts. This project involved the creation of a new research center in Nancy, the Centre de recherche pour un trésor de la langue française, which was to become the current major research group ATILF, well-known for its work on the Text Encoding Initiative (TEI—www.tei-c.org). ATILF is a group accredited by the Conseil national de la recherche scientifique (CNRS—French national research council); it is based

at the University of Nancy and is now the most important center in France for the encoding and analysis of digital texts, the TEI being the most widely used international standard for the markup of humanities texts. The initial collection of 19th- and 20th-century texts compiled under the direction of the linguist and lexicographer Bernard Quémada formed the basis of what is now Frantext (www.frantext.fr).

The literary tradition in France has also led to a large amount of work on quantitative analyses, notably carried out in Nice by Etienne Brunet. This work necessitated the creation of more electronic texts and also a concordancer, Hyperbase, which is widely used for corpus analysis in France. This quantitative literary work cannot really be considered as corpus linguistics as it is aimed essentially at authorship studies of literary texts, although more recent work on political texts using Hyperbase is more applied in orientation, notably with the work of Damon Mayaffre.

Political issues have also been an important element in the work of researchers like André Salem and Dominique Labbé, but here again the interest lies more in the discourse of individual politicians or movements than in an attempt to analyze language in general. Work carried out in Aix-en-Provence by Jean Véronis led to the compiling of corpora from press and EU sources to study political discourse, but in this case more from an NLP viewpoint.

Non-Literary Written Corpora

Apart from the literary tradition and work on spoken corpora, it was English-language studies that primarily discovered and promoted corpus linguistics. Much current work on French corpora is carried out by researchers initially involved in English-language teaching. Apart from these pioneers, the main interest in corpora came more from the NLP community, with the exception of work on spoken language analysis.

Much early work on French corpus linguistics arose from sociolinguistic studies, notably through the publications of Françoise Gadet and Claire Blanche-Benveniste. The former undertook sociolinguistic analyses while the latter carried out essential corpus building work and investigations at Aix-en-Provence, leading to a reevaluation of attitudes to both genre and grammar in spoken French. Much work in developing spoken corpora has been carried out in the Université de Provence, and also in other centers such as Lyon and Orléans.

The interest in oral corpora in France led to a perceived need to adopt common standards for the collection, transcription, and archiving of material. The result was a project under the auspices of the French Observatoire des pratiques langagières (Observatory of language practices), part of the Délégation générale à la langue française et aux langues de France (DGLFLF). In France, language is very much a state affair, even if the state puts very little money into actual research. The resulting reference work edited by Olivier Baude (2006) talks little about applications, which was not his brief, but does provide valuable information on all aspects of corpus constitution, including the far too often neglected legal aspects.

Nevertheless, most data-collection projects remain small and tackle extremely precise sociolinguistic issues rather than more general questions of language, as might be expected in corpus linguistic research. If anything can differentiate corpus linguistics from other related fields in applied linguistics, it must certainly be that the objective of the former is to generalize about language or language varieties and to compare with other subsets.

Journées de la Linguistique de Corpus

Despite the lack of available corpora, the French corpus linguistics scene is dynamic with both the Association française de linguistique appliquée (AFLA—French Association for Applied Linguistics) and the Association pour le traitement automatique de la langue

(ATALA—[French] Association for NLP) hosting events. The *Revue Française de Linguistique Appliquée* has, to date, published three issues dedicated to corpus linguistics (1996, 1999, and 2007; <http://www.rfla-journal.org/presentation.html>), although the contents give a better picture of what is happening elsewhere in the world than in France as the definition of “corpus” tends to be very wide. Since 2002 a journal with a strong literary bias entitled *Corpus* (www.unice.fr/ILF-CNRS/CORPUS) has been published annually by the research group created by Etienne Brunet at the University of Nice. Major written works are still relatively rare, although three books can be mentioned, the very NLP-oriented volume by Habert, Nazarenko and Salem (1997), the work edited by Bilger (2000), and that edited by Williams (2005). The latter shows the broad spectrum of work being carried out in France as shown through contributions to the 2002 edition of the conference “Journées de la Linguistique de Corpus” (JLC) organized first annually, and now biennially, at the Université de Bretagne-Sud in Lorient.

The JLC originally started as a workshop in 2001. The success led to a major conference in 2002 with further editions at two-year intervals from 2003. From 2005 onwards the proceedings have all been published online in the *Texte et Corpus* journal (<http://web.univ-ubs.fr/corpus>) giving an up-to-date picture of what is happening in the French-speaking world.

The JLC aim to bring together all those interested in corpora in French or in French-speaking countries. This means a very broad range of approaches ranging from the highly computational to teaching-based studies. Variety is not only the spice of life, but it breaks down frontiers between disciplines so that people from very different fields can meet and exchange views and information.

French Corpora

As we have seen, French corpus linguistics is relatively young and suffers from the lack of a national reference corpus. Corpus projects are legion, but corpora tend to be small and the compilers lack the necessary copyright permissions to make them available. Larger resources do exist, but these are often created by and for the language-engineering community and distributed through ELDA (Evaluations and Language Resources Distribution Agency) at prices that are beyond the means of university research groups.

Literary Corpora

The biggest and most well-known French corpus is Frantext. This largely literary archive of 3,952 whole texts has been partially lemmatized and can be consulted online under license and with restricted access. For those involved in French literary studies this is a marvelous research tool with full texts for key works over a period of nearly 700 years. Unfortunately, the allergy felt by some, and promoted by others, in literary academia for computerized tools means that many students of French are unaware of the existence of this corpus, even if it is used by those preparing for the (highly) competitive examination used to select teachers in French secondary schools, the *agrégation*. This is a great shame as, although the interface is not very user-friendly, the contents are a gold mine for anyone studying the evolution of the French language.

The archive consists of two main parts: the main section covers contemporary French from 1500 to the present and a separate corpus of Middle French covers the period from 1330 to 1500. The main corpus allows the user to study lexical, stylistic, spelling, and grammatical changes over a long period of time. Syntactic and lexical variation mean that part of speech markup is impossible for earlier periods, but more recent texts are available in a separate part of speech (POS) tagged and lemmatized corpus. Rights have always

been a major issue with Frantext, which explains why access is so restricted. However, a large subset of copyright-free texts is now available from the Centre national de ressources textuelles et lexicales (CNRTL) Web site (www.cnrtl.fr). This is highly appreciated as downloadable resources are vital for developing a discipline where people like to experiment with different concordancers.

Students of the French language can also turn to the French of Quebec with license-free access to the Quebec counterpart to Frantext, Québétext (www.tlfq.ulaval.ca/quebetext). The Trésor de la langue française au Québec is a rich source of data containing texts published between 1837 and 1919. Like Frantext, the archives can only be accessed online, but, in this case, the access is open.

For those wishing to compile their own literary corpora it is possible to access some major texts in HTML format through the Association des bibliophiles universels (ABU) Web site (<http://abu.cnam.fr>); the Bibliothèque nationale Gallica Web site (<http://gallica.bnf.fr>) also has downloadable texts, but many of these are as yet only available in PDF format. Many other resources exist through the TEI-based projects and other collections held on university servers, but the majority of literary corpora are the work of scholars who do not hold copyright, and who consequently cannot distribute their source data.

Spoken Corpora

If written corpora tend toward the literary, the area in which corpus linguistics has really developed in terms of applied linguistics has been spoken corpora, which tend toward the sociolinguistic.

Two major early developments in spoken corpora were the projects of the GARS research team in the University of Provence and sociolinguistic work carried out at the University of Orléans using the Etude sociolinguistique sur Orléans corpus, the latter consisting of a series of interviews carried out in the late 1960s. The results from these studies exist, but the problem lies in actually tracking down the corpora.

Name changes and mergers among French research groups can lead to problems of visibility as acronyms change frequently. In the case of GARS, the group became DELIC before the latter split up with some members forming TALEP—Traitement automatique du langage écrit et parlé (Automatic Processing of Written and Spoken Language) along with some members from CALN—Compréhension automatique du langage naturel. All of these belong to LIF—Laboratoire d'informatique fondamentale. Unfortunately, corpora are not mentioned on their Web site and a knowledge of history is required to understand the meanders. Another source of freely downloadable corpora might seem to be the Corpus de la parole Web site. This does give links to major projects in spoken corpora such as the Orléans corpus and the Phonologie du français contemporain corpus and others. Unfortunately, what this Web site does not do is link to the actual corpora. However, much of the material from GARS-DELIC is available on the C-ORAL ROM dataset (Cresti & Moneglia, 2005). This very rich source contains data in four Romance languages, including French. It is here that many of the earlier spoken corpora can be found along with more recent material. The CD-ROM also contains tools, for which more up-to-date versions can be found online. One source for freely available corpora is the Parole publique archive held at the University of Tours (http://www.info.univ-tours.fr/~antoine/parole_publicue/corpus.html). These are small, but can be downloaded. Anyone involved in building spoken corpora and wishing to share data can upload material and thereby participate in a movement for open-source corpora.

Obviously, much is also happening in other French-speaking countries, notably at the Université Catholique de Louvain in Belgium with the VALIBEL research group (www.uclouvain.be/valibel). In addition to an inventory of existing corpora and transcription procedures, their Web site also gives access to corpora via the MOCA (Multimodal Oral

Corpora Administration) interface. As ever, open access with downloading is difficult, but at least access exists.

For those interested in language learning another useful source is the French Learner Language Oral Corpora at the University of Southampton (www.floc.soton.ac.uk). The building of learner corpora is a growing field in the study of "Français langue étrangère" (French as a foreign language) studies, but few corpora are freely available, as they are largely built for small studies and PhD theses. The Southampton dataset concerns child language from subjects between the ages of 5 and 11, and contains corpora built at Southampton and also at other partner universities. Access is via the CHILDES software (<http://childes.psy.cmu.edu/>). The very informative Web site gives details of methodologies adopted and the criteria for corpus constitution. However, spoken corpora are inevitably small, so linguists seeking large amounts of data have to turn to written sources.

Non-Literary Written Corpora

If a French linguist wants to turn to contemporary language, the only direction seems to be toward newspapers. The obvious answer here is to download material from Web sites or from databases such as Lexis Nexis or Factiva. In practical terms this does give access to a large amount of data but, since restrictions apply, the resulting resource cannot be disseminated despite any time spent in marking up data in XML and the carrying out of POS tagging, which is, in itself, a breach of copyright.

The CNRTL, who brought us the open-access Frantext, also have a newspaper corpus online from a regional source. This gives access to three years of material from the regional newspaper *Est Républicain* in XML format. Otherwise, those who want large amounts of data have to look to CD-ROM sources, and this means *Le Monde* and *Le Monde Diplomatique*, both available through ELDA. They are not true corpora, however, in that they are a single source, with *Le Monde* being just a very particular center-left Paris-centered variety of the French language. Unfortunately, much research continues to be based on these, and will be until a reference corpus comes along.

No centralized database of written corpora exists in France, but the Réseau des corpus lexicaux québécois (Quebec network of lexical corpora) provides a variety of corpora built and maintained by the five universities of the province. Access is still invariably by interface due to copyright restrictions.

Web-based corpora are also increasingly available. The biggest are those held on the Corpus Architect Web site (<http://ca.sketchengine.co.uk>). Corpus Architect, previously Sketch Engine, is not free but is not expensive either, and gives access to the online concordancing and sketch building tools that have proved invaluable in lexicography. The French corpus is a very large collection of Web data from which concordances and word sketches can easily be built and analyzed through a tried and tested convivial interface. Those wishing to download a very large Web-based corpus of French can also contact the WaCky (Web as Corpus kool ynitiative; <http://wacky.sslmit.unibo.it/doku.php?id=start>) project which will make the French, and other language, corpora available free of charge on request. At the time of writing the frWaC corpus is at 1.6 billion words.

Another Web-based source is that held at the University of Leeds, which is freely available online with a concordancer interface (<http://corpus.leeds.ac.uk/internet.html>). A very simple interface in English gives access to Internet corpora in several languages. It is sufficient to type the query and select the language to get a concordance. The same can be done to get collocations extracted via a series of different statistical measures: Mutual Information, T-Score and Loglikelihood. More sophisticated searches can be done using Corpus Query Processor (CQP) syntax, a system for writing complex queries developed during the Corpus Workbench project (<http://www.ims.uni-stuttgart.de/projekte/>

CorpusWorkbench/CQPUserManual/HTML/). These are mass data; the user has no information as to selection criteria. While such corpora may not fulfill the canons of corpus building criteria that are laid down, tried, and tested in corpus linguistics research (see Wynne, 2005, for a full discussion), they are much used in language engineering and do provide access to very large amounts of data.

Parallel Corpora

From early on in the development of corpus studies an interest arose for parallel corpora, particularly in the NLP community with its interest in terminology extraction and automatic, or assisted, translation. One notable resource was that developed within the TELRI (Trans-European Language Resources Infrastructure; <http://telri.nytud.hu/>) initiative. Unfortunately, as with many Europe-funded projects, once the project is over access to data is difficult. This is very much the case with the TELRI Tractor archive. Freely available parallel datasets include the EUROPARL corpora built from European Parliament texts and the INTERSECT corpus held at the University of Brighton. The former is a large project with data available for the period from 1996 to 2009 in 11 different languages, including French (www.statmt.org/europarl). The corpora are downloadable with the relevant documentation. The latter is at about 1.5 million words for French and is formed from a balanced corpus covering a variety of genres (<http://artsresearch.brighton.ac.uk/research/academic/salkie/portfolio>). The files are plain text, and have been aligned using ParaConc (<http://www.athel.com/para.html>). Copyright issues mean that the corpus is not freely downloadable, but it is available on request to the researchers involved. Although parallel corpora remain a staple in NLP, corpus linguistics and much NLP is now turning to comparable corpora in order to get over the inevitable bias brought in by the translation process. Projects such as IntUne (Integrated and United; www.intune.it) and METRICC (Mémoire de traduction, recherche d'information et corpus comparables or Translation Memories, Information Retrieval and Comparable Corpora; www.metricc.com) are only beginning to analyze the complexity of such corpora, and as yet none are available for distribution or online access.

Lexicographical and Specialized Corpora

French commercial lexicography may fail to take corpora seriously, but terminology and special language studies do not. This is not to say that the big dictionary publishers do not use corpora, but that they do not make them available. In developing French-language lexicography two nations shine forth: Belgium and Quebec.

With the ancient Katholieke Universiteit Leuven and the Université Catholique de Louvain, Belgium is well served in corpus linguistics. French-speaking Louvain has already been mentioned; its Flemish counterpart is particularly active in both lexicographical and terminological corpora. Most notable is the team built up by Jean Binon and Serge Verlinde with the DAFLES (Dictionnaire d'apprentissage du français langue étrangère ou seconde) project. This is a unique learning interface for French with access to corpora—a model for data-driven learning.

Terminology is another field that is well represented in Belgium with TERMISTI (ISTI = Institute for Translators and Interpreters; www.termisti.org) in Brussels. Their Web site gives a large number of links to resources and tools in a variety of languages, including French. Another major lexicographical and terminological center is the Observatoire de linguistique sens-texte (OLST; <http://olst.ling.umontreal.ca>) in Montreal. A visit to their site will give access to a number of resources, including Corpus Migou, a consultation interface for their corpora.

France itself has well-developed research centers using corpora for special languages; there are centers in Paris with the EILA research group at the Université Paris-Diderot and in Lyon with the CRTT (Centre for Research in Terminology and Translation; Université de Lyon 2). In both cases, corpora are built, often by doctoral students working on highly specialized themes, but copyright impedes access.

The French national research agency (Agence nationale de la recherche or ANR) has funded the construction of corpora, but the definition of the terms has been extremely fuzzy. However, one ambitious project looking at authorial position and learner corpora has been funded: the Scientext initiative (<http://aiakide.net/scientext-site/spip.php?article1>). This ANR-funded project has built corpora in French and English. The latter is fully open source and can be downloaded; the former is currently available through an interface. If ambitious funding and a genuine analysis of needs takes place, this could be the means to gradually move forward to building a reference corpus for French.

Conclusion: Corpora in France and the French-Speaking World

We have a strange dichotomy. Corpus linguistics is alive and well in France, but corpora are far and few between, at least those that can be disseminated. This initial survey may stimulate people to come forth with more addresses or to put more material online so that a directory of available resources can be built. A careful reading of *Texte et Corpus* would provide a long list of cited corpora. Unfortunately, many have no distribution possibility or very limited access, generally through a Web interface.

The way forward can only be through cooperation with those who need corpora endeavoring to persuade research funding bodies that, as researchers work for free, the tools they need should be free too. A lot of hidden resources will continue to lie insufficiently exploited on machines throughout France and the French-speaking world. This entry does not seek to be exhaustive; it is an overview of what is available. What it would like to be is also a stimulus so that a more complete picture may be drawn and more ambitious projects may see the light of day.

Corpora: German-Language

WOLFGANG TEUBERT

This entry focuses on large and more frequently used German-language corpora, their use, and applications. Many more corpora have been compiled for specific research issues, and some of them can be found on the Web for instance by using Google Scholar (www.scholar.google.co.uk/). The corpus activities of the Institut für Deutsche Sprache (IDS) in Mannheim are accorded a particular focus, because this institution was the cradle of German corpus linguistics. IDS corpus compilation and research reflects the changing corpus philosophy from the early decades of German corpus research to the present time. The IDS is also an important clearing and service center for contemporary German language studies. The remit of the corpus linguistics group at the IDS is to develop new methods and tools for a data-driven exploration of very large text corpora. Researchers inside and outside the IDS are invited to use corpora and software for studies in the field of lexicology/lexicography, grammar, and language variation. The goal is to enable a fruitful interaction between top-down and bottom-up approaches that will enhance our understanding about the way discourse behaves. For more information see IDS Korpuslinguistik (www.ids-mannheim.de/kl/) and IDS (www.ids-mannheim.de).

While some diachronic and historical corpora are also listed, dialect corpora outside the IDS are not documented as this would demand too much space and as there is already an excellent Web page containing all the relevant information. However, some corpora of related or neighboring languages, Frisian, Lëtzebuergesch, and Yiddish, are referenced. There is also a list of parallel corpora with German as one of their languages.

Excluded are commercial corpora and corpora not compiled for linguistic research but for applications in computational linguistics, natural language processing, or human language engineering, that is, corpora providing data for knowledge extraction, machine translation, artificial intelligence and expert systems, conceptual ontologies, or speech recognition/understanding systems.

The Kaeding Corpus: A Corpus *Avant la Lettre*

As early as 1891, the stenographer Friedrich Wilhelm Kaeding began to compile a non-electronic 11-million-word corpus of contemporary literary works, newspaper texts, official announcements and directives, business letters, and specialist literature. The purpose was to develop a new stenographic system based on dependable statistics of syllable frequency. In the absence of computers, it turned out to be a mammoth project involving 100 compilation centers all over Germany with 665 collaborators (Kaeding, 1897/1898). The Kaeding corpus also formed the basis for Helmut Meier's *linguo*-statistical studies, begun in 1922 and finally completed in 1964 (Meier, 1964/1967). Later, in the 1970s, a computational analysis of the Kaeding corpus formed the basis for the development of the *Zertifikat Deutsch* of the Goethe-Institut (www.goethe.de/lrn/prj/pba/bes/tdf/enindex.htm).

Corpora and Corpus Research at the Mannheim Institut für Deutsche Sprache (IDS)

The IDS was set up in 1965. Its foundation marks a new beginning of research on contemporary German language. Much earlier research during the 1940s and 1950s was seen as problematic due to the closeness of many scholars to the Nazi regime. It was also the time when the subdiscipline “Germanistische Sprachwissenschaft” [German language studies] was gradually introduced at German universities, on a par with German literature and history of the German language, within the discipline of German studies (“Germanistik”). The remit of the IDS was to describe language objectively using real language data. The results of this basic research fed into applications such as the compilation of dictionaries, grammars, and textbooks for teaching German as first and as foreign language.

Early History of Written Language Corpora at the IDS

Almost half a century ago, the first IDS Yearbook stated:

The section “Documentation of contemporary German” will fill an urgent need. In a representative cross section of today’s literature and on the basis of carefully prepared software, initially the written German language of today will be stored electronically, considering aspects of lexis as well as of syntax. The resulting data will be made available to all researchers working on the German language. (Institut für Deutsche Sprache, 1967, p. 12, my translation)

What has changed since is that the naïve belief in a representative corpus has given way to a more cautious and multifaceted view of what a corpus can represent. In 1969 the IDS acquired its first (mainframe) computer, with a core memory of no more than 7 megabytes, and completed its first corpus, the Mannheimer Korpus (MK1), consisting of 293 texts or 2.2 million words published between 1950 and 1967, featuring fiction, some popular science and other non-fiction, and also a small selection of newspaper and magazine texts. The texts were keyboarded on punched tape. As neither screens nor online access was available, any results obtained with still rather primitive corpus software were printed out as hard copy. For more information see IDS Korpora (www.ids-mannheim.de/cosmas2/projekt/referenz/korpora.html).

The MK1 provided the empirical data for the project *Grundstrukturen der deutschen Sprache* dealing with grammatical phenomena such as the passive voice, tenses, the subjunctive, and sentence patterns, mostly completed during the early 1970s. Due to the computational shortcomings, the actual work, such as the extraction of citations and their annotation, was carried out manually. Still, the resulting monographs constitute proper corpus-based studies and had important implications for all subsequent grammatical research, correcting many erroneous previously held beliefs. They were published in the 1970s in the series *Heutiges Deutsch, Reihe 1: Linguistische Grundlagen. Forschungen des Instituts für deutsche Sprache*. For more information see IDS Publikationen (<http://pub.ids-mannheim.de/>).

Another early corpus project was the Bonner Zeitungskorpus (BZK) compiled at the Bonn branch of the IDS and consisting of cross sections of a leading East German paper (*Neues Deutschland*) and a leading West German paper (*Die Welt*) of the years 1949, 1954, 1959, 1964, 1969, and 1974. It was the first German corpus suitable for diachronic research. For more information see IDS Korpora (www.ids-mannheim.de/cosmas2/projekt/referenz/korpora.html). Some studies using this corpus were published in Hellmann (1984).

The IDS Archive of Written Language Corpora Today: DeReKo (Deutsches Referenzkorpus)

From 1999 to 2002, the IDS, in conjunction with the Institut für Maschinelle Sprachverarbeitung at Stuttgart University and with the Seminar für Sprachwissenschaft at Tübingen University, carried out the project DeReKo (Deutsches Referenzkorpus), which led to the compilation of complete and unaltered (i.e., no correction of spelling, etc.) texts (starting from 1956) representing a wide range of genres (newspapers, fiction, political, legal, and scientific texts) and covering Germany, Austria, and Switzerland, originally totaling ca. 1 billion words. Kupietz and Keibel say, "The main purpose of DeReKo is to serve as an empirical basis for the scientific study of contemporary written German" (2009, p. 54).

DeReKo is now the label given to the entirety of written German language corpus resources at the IDS. It comprises a host of corpora totaling about four billion words, three billion of which are accessible online for language researchers worldwide. The majority of these corpora were compiled at the IDS, others were transferred to Mannheim after the local projects had expired. The current list comprises the MK1 and MK2, the Limas-Korpus (see below), numerous corpora of German, Austrian, and Swiss newspapers and German language newswires, corpora devoted to specific authors (Goethe, the Grimm brothers, Marx and Engels, Thomas Mann), corpora of languages for special purposes, contemporary fiction, as well as some smaller special corpora. Three billion words can be accessed from outside the IDS, with a further billion available only to researchers working at the IDS. A complete list can be found at IDS Aktuelles Korpusarchiv (www.ids-mannheim.de/kl/projekte/korpora/archiv.html).

Development of an IDS Corpus Philosophy

The early beginnings of corpus research were marked by a belief that it would be possible to design and compile a finite corpus representative of the German language, if not in respect to the lexicon then at least in respect to its grammar. But in the 1970s the European corpus community began to question the concept of representativeness and its discontents. The outcome of this discussion is set down in the NERC Report (Calzolari, Baker, & Kruyt, 1995). What exactly is the discourse universe sampled by the corpus? What is our definition of standard language? Is it more a matter of text production or of readership? Which social and regional parameters have to be taken into account? It was in the 1980s that the aim of an authoritative balanced or representative corpus was finally abandoned. Instead the task was redefined: the IDS would offer a variety of modular corpora among which a user had to select the modules they expected to fit their specific research question. The task of demonstrating that a corpus samples a particular discourse universe is thus devolved from the corpus compiler to the corpus investigator. Consequently, it was decided to assemble corpora compiled for different purposes under the umbrella of a highly sophisticated query system, Cosmas I (Corpus Search, Management and Analysis System), now replaced by Cosmas II (www.ids-mannheim.de/cosmas2/). It allows the researcher to compile their customized corpus from the resources on offer. This philosophy of separating corpus compilation from corpus research promotes a corpus acquisition strategy that can be described as opportunistic, that is, building an ever-growing corpus archive with limited means, based on the principle of "primordial sample design" (see Kupietz, Belica, Keibel, & Witt, 2010).

While the use of concordancing tools became the primary approach for corpus research on English, the limitation of single concordance lines proved to be inappropriate for German, with its very liberal word order. Often elements semantically closely linked are

dispersed over a whole sentence. This is why normally the sentence is the unit of reference in most German-language corpora. Consequently all corpus texts are divided into their sentences, and the sentence number provides the reference. As German is a highly inflecting language, Cosmas makes provisions for queries either by lemma or by a definable subset of word forms of a lemma. This feature also allows a search for all compounds of which a lemma can be part (compounding being another common feature of German). DeReKo comes with annotations generated by three tagging tools: TreeTagger, Machine Phrase Tagger (Connexor Oy), and Xerox FST Linguistic Suite (more information at IDS Annotationen, www.ids-mannheim.de/kl/projekte/korpora/annotationen.html, and in Belica, Kupietz, Längen, & Witt, 2010). The IDS corpus setup is based on the international standard XCES as set out in the Corpus Encoding Standard for XML (www.xces.org) and compatible with the text encoding initiative guidelines TEI P5 (www.tei-c.org/Guidelines/P5/).

While most corpora in applied linguistics are organized synchronically, only the diachronic dimension of the discourse will reveal how language changes and how the meaning of the same segment type (word or phrase) in a text today differs from the meaning of this segment type in prior occurrences. This is why special software for monitoring semantic change was designed and implemented for the Wendekorpus, a corpus divided into six phases covering newspaper texts in West and East Germany covering the end of the GDR and the German reunification, from mid-1989 to the end of 1990. For more details, see IDS Cosmas Gesamtkonzept (www.ids-mannheim.de/kl/projekte/cosmas_I/gesamtkonzept.html).

Spoken Language Corpora and Corpus Research at the IDS

The Archiv für Gesprochenes Deutsch (AGD) comprises a large selection of corpora partly compiled at the IDS, partly in external projects. They are divided into (a) dialects spoken inside Germany (Binnendeutsche Mundarten), (b) colloquial German/standard German (Binnendeutsche Umgangssprache/Standardsprache), (c) varieties spoken outside Germany (Auslandsdeutsche Varietäten), and (d) corpora for conversation analysis (Gesprächskorpora). These corpora exist in the form of recordings and, to a large extent, also in the form of transcripts. About 8,000 of altogether 15,000 documents are implemented in the database. For legal reasons only a fraction can be accessed from the outside. Without authorized access a user can only try out ten different interactions as registration is necessary to work with the full research version. There are a number of query options, including those provided by Cosmas II (<http://agd.ids-mannheim.de/html/index.shtml>).

In the early days of the IDS, its Freiburg branch was compiling a corpus of spoken standard German for the purpose of investigating grammatical and stylistic registers of spoken German and comparing them to those of the written language. The size of the Freiburger Korpus is 500,000 words. It has provided the basis for a number of studies, describing for the first time the grammar of standardized spoken German in a systematic way, for instance, on the subjunctive, the passive voice, the past tenses, and on vocabulary size. It is complemented by a corpus of “natural” dialogues, compiled from 1974 to 1978. Some of these studies were carried out in conjunction with the Goethe-Institut, thus providing a basis for their German courses for non-native speakers. Corpus texts and the research on them are published in the series *Heutiges Deutsch* (Hueber Verlag).

Even older than the Freiburger Korpus are the origins of the Deutsche Spracharchiv, the key archive of spoken German language recordings, founded in 1932. Its main collections (elicited narratives with a focus on dialects) date from the mid-1950s to the late 1960s and cover West Germany and surrounding areas (Vorarlberg, Liechtenstein, Alsace, and the Netherlands, but also include speakers from former East Prussia and from what used to

be called West Prussia). This corpus comprises ca. 6,000 recordings, representing ca. 1,000 mostly rural locations with speakers from three generations. About 3,000 recordings are transcribed and accessible. They are complemented by a collection of East German dialect recordings. The last major project of the Deutsche Spracharchiv before it was integrated into the AGD was a rather comprehensive recording operation of extant (East) Yiddish dialects, including elicited narratives recordings of Holocaust survivors. Many of these recordings have been transcribed and are accessible.

Another important corpus is the Pfeffer-Korpus, consisting of ca. 400 narratives and dialogues, covering the regional accents of colloquial German sampled in 1961 from the whole German-speaking area. It was transcribed, encoded, and edited at the Institute for Basic German at Stanford University under the guidance of Alan Pfeffer.

The conversation corpora are more recent. During the 1980s, a corpus *Stadtsprache* sampling 840 recordings (250 also available as transcripts) of colloquial discourse of diverse social strata and in different public environments of Mannheim was collected. During the same period, a corpus of 223 professional mediation talks (*Schlichtungsgespräche*, of which 103 are available as transcripts) was also compiled. The corpora were made the object of a number of studies within the framework of ethnomethodology and conversation analysis (www.ids-mannheim.de).

The Limas-Korpus: A German Version of the Brown Corpus

The Limas-Korpus is compiled on principles similar to those of the Brown Corpus. The Brown Corpus, set up in the 1960s by Henry Kucera and W. Nelson Francis at Brown University, contains a selection of American English (about 500 text samples of 2,000 words and consisting of about one million words). The Limas-Korpus contains 500 excerpts from various kinds of texts, each with a length of ca. 2,000 words. Randomly selected on the basis of the “Nationalbiographie” of 1971/1972, this corpus is composed of textual excerpts from the 33 different domains into which this bibliography categorizes all German language publications. The project was initiated in 1970 by the Arbeitsgruppe Limas (*L*inguistische und *M*ASchinelle Sprachbearbeitung) in Bonn and completed in 1973. Although the work on the project is completed, the corpus can still be accessed at various sites, for example, at Limas (www.korpora.org/Limas/) and at IDS Korpora, and is also available on microfiche (it is described in more detail in Glas, 1975).

Corpora at the DWDS

The DWDS (Digitales Wörterbuch der deutschen Sprache) is a long-term project of the Berlin-Brandenburg Academy of Sciences. It has a large collection of corpora, and it is also linked to the C4 corpus project which will, once completed, provide a balanced 20th-century corpus of the German-language area in Austria, Switzerland, and South Tyrol consisting of 80 million words. For more information on the C4 project, see Korpus C4 (www.korpus-c4.org).

All DWDS corpora are lemmatized and part of tagged speech. Many of them can be accessed without subscription. These are the more important corpora:

DWDS Kernkorpus: This corpus covers, in balanced form, text genres over the whole 20th century. It consists of 100 million words in ca. 80,000 documents, encoded/annotated in conformance with XML/TEI (see Text Encoding Initiative, 2009).

Korpus Gesprochener Sprache: This corpus comprises 1,500 transcripts covering the 20th century, totaling 2.5 million words.

DDR-Korpus: This steadily growing corpus, compiled in conjunction with the Berlin Humboldt University, comprises currently 1,150 texts covering the full duration of the East German state from 1949 to 1990, mostly texts written by East German authors and published in West Germany. It contains 9 million words.

Korpus Jüdische Periodika: This corpus, covering the years from 1887 to 1938, is compiled in conjunction with the project Compactmemory. Currently it comprises 50,000 pages taken out of eight periodicals and linked to digitized images of each page, and consists of ca. 26 million words.

Zeitungskorpora: This corpus consists of the weekly *Die Zeit* (mainly since 1996, currently 106 million words and regularly updated), *Berliner Zeitung* (covering the years 1994 to 2005 and consisting of ca. 250 million words), *Tagesspiegel* (covering the years 1996 to 2005 and consisting of ca. 170 million words), and *Potsdamer Neueste Nachrichten* (covering the years 2003 to 2005 and containing ca. 15 million words).

There is also an opportunistic *Ergänzungskorpus* of ca. 1 billion running words (mostly newspaper texts from between 1990 and 2000). There is more information on the corpus resources at the DWDS (www.dwds.de). A list of relevant publications is also available at this Web site.

Schweizer Textkorpus

The Schweizer Textkorpus is an ongoing project of Basel University. The goal is the compilation of a substantial corpus of texts in standard (written) German written by Helvetian authors of the 20th century. It will form part of the 80-million-word Korpus C4 mentioned above. The Swiss contribution aims to provide a balanced representation of Swiss German vocabulary. In 2009 the first phase was completed, comprising ca. 20 million words, about half of which are currently accessible online. For more information see the Schweizer Textkorpus (www.schweizer-textkorpus.ch).

Austrian Academy Corpus

The Austrian Academy Corpus (AAC) is a long-term project of the Austrian Academy of Sciences. While the corpus aims to contribute to new applications in text technology and to research in philology and cultural history, it has also compiled a large structured collection of Austrian texts (books, newspapers, and journals, including *Die Fackel*) from 1848 to 1989. The digitized texts are linked to the scanned page images. There is also a Viennese Theatre Corpus focusing on the playwright Johann Nepomuk Nestroy, and a Baedeker Corpus, consisting of first editions of Baedeker guidebooks between 1875 and 1914. These corpora are richly annotated.

The combined size of all AAC corpora is currently ca. 1 billion words. The AAC is part of the C4 project and forms part of the Austrian subcorpus. For more information see Austrian Academy Corpus (www.aac.ac.at).

Initiative Korpus Südtirol

The aim of the Initiative Korpus Südtirol is the collection of South Tyrolean texts and their compilation in the form of electronic corpora in order to make them available for a wider public and to carry out research on the specificities of South Tyrolean German. The Initiative Korpus Südtirol is a joint project of the Freie Universität Bozen, the Europäische Akademie Bozen, and Innsbruck University. In its first phase, from 2005 to 2008, the

initiative compiled a richly annotated corpus of 68 million words. This corpus is freely accessible. It feeds into the C4 project (see above). For more information see Korpus Südtirol (www.korpus-suedtirol.it).

Wortschatz Universität Leipzig

The German part of this project consists of a (finite and completed) 30-million-word newspaper corpus, available for download. A second (Web and non-completed) corpus is under construction and is expected to offer another 30 million words. In addition, an internal corpus, Deutscher Wortschatz Online, with 35 million sentences or 500 million words, can also be queried. For more information see Wortschatz Universität Leipzig (<http://wortschatz.uni-leipzig.de>).

Diachronic and Historical Corpora

There are a growing number of diachronic and historical corpora or corpora featuring earlier phases of German. These resources have been primarily compiled not for linguistic research but for literary or philological studies (e.g., the Projekt Gutenberg initiative at <http://Gutenberg.spiegel.de>). Listed below are some diachronic corpora compiled with linguistic research in mind.

Bonner Frühneuhochdeutschkorpus: This corpus is a collection of approximately 100 published books in Early Modern German (ca. 1350–1700). Each book is available in HTML code (2002), useful for older browsers with a legible HTML version of the text, and the customized FnhdC/HTML version using Unicode-3.1 with morphological and syntactic annotation (www.korpora.org/Fnhd/unten_ueberfnhd.html).

Digitales Mittelhochdeutsches Textarchiv: The goal of this archive at Trier University is to make available a comprehensive collection of philologically reliable Middle High German text editions. It is the basis for the *Mittelhochdeutsches Wörterbuch*, a joint project of the Mainz Academy of Sciences and Göttingen University. The archive was compiled in co operation with the Electronic Text Center of the University of Virginia. Most of the ca. 100 texts are available as XML downloads (<http://mhgta.uni-trier.de/index.html>).

Reference Corpus Middle High German (1050–1350): This project at Bochum University commenced in 2009 and will be concluded in 2012. It aims at creating a reference corpus of Middle High German, with annotation on the morphosyntactic level (www.linguistics.ruhr-uni-bochum.de/~dipper/project_ddd.html).

Oxford Text Archive: This archive contains ca. 30 German texts, many of them from the Middle High German period. Most of them are available to the general public (<http://ota.ahds.ac.uk/catalogue/index-id.html>).

TITUS (Thesaurus Indogermanischer Text- und Sprachmaterialien): This is an ongoing project of Frankfurt University. Besides text in most Indo-European languages, it also features a surprisingly large selection of Old/Middle High and Early Modern German texts, usually in HTML format and often also in a “wordcruncher” version. They are annotated to a high standard. For access to many of the texts it is necessary to sign up as a member of TITUS (<http://titus.uni-frankfurt.de/indexe.htm>).

German Dialect Corpora

The Archiv für Gesprochenes Deutsch (AGD) at the IDS offers a broad selection of German dialects in the form of recordings and corpora of their transcripts. However, many more

corpora exist for many regional or local dialects spoken within the German language area and in the diaspora. They are listed in Paul Joyce's Web page (Joyce, 2010), "Deutsche Dialekte—Linkverzeichnis" at the University of Portsmouth, covering not only German dialects but also neighboring languages such as Yiddish, Frisian, Lëtzebuergesch and the Slavic language Sorbian spoken in parts of eastern Germany (see below; <http://userweb.port.ac.uk/~joyce1/dialects/>).

The Situation of Related Neighboring Languages

Frisian: While (West) Frisian is still very much alive, with ca. 400,000 speakers, in the Dutch province Friesland or Fryslân, with its municipal center Ljouwert (Leuwarden), it has largely disappeared in its eastern variety (East Frisian), formerly spoken along the German North Sea coast between Emden and the Jade estuary. However, the variety spoken by perhaps 10,000 speakers along the eastern coast of Schleswig Holstein and Jutland and on adjoining islands (North Frisian) is still kept actively alive. So far, however, there is no corpus.

The Fryske Akademy in Ljouwert is constructing several corpora, for New Frisian, 19th-century Frisian, Middle Frisian, and (planned) Old Frisian, covering the time from the 12th to the 20th century. The New Frisian corpus with currently 25 million words is accessible online from the Akademy. For more information see Frisian Corpora (www.fa.knaw.nl/fa/3departments-and-disciplines/departement-of-linguistics/taalkorpora_en_/frisian-language-corpus).

Lëtzebuergesch: Luxembourgish/Lëtzebuergesch is one of the official languages of Luxembourg (besides French and German). Lëtzebuergesch now has a standardized orthography and grammar and has about 300,000 speakers. However, so far no substantial corpus has been compiled. For more information see Laboratoire de linguistique et de littératures luxembourgeoises (http://www.wfr.uni.lu/recherche/flshase/laboratoire_de_linguistique_et_de_litteratures_luxembourgeoises/recherche).

Yiddish: While West Yiddish, the variety formerly spoken by Jews in Germany, Switzerland, and Alsace, became practically extinct at the end of the 19th century, (East) Yiddish, with its center in Wilna, and spoken in various dialects in Poland, Czechoslovakia, the Ukraine, the Baltic states, Belorussia, and Russia, had a strong presence up to the Holocaust with millions of speakers and a wide range of literature. It has all but disappeared from the lands conquered by the German troops in World War II, but it survives (as a taught language) in the diaspora, for example, in New York, Buenos Aires, and also in Israel. The largest collection of Yiddish recordings is found at the Language and Culture Archive of Askenazic Jewry at Columbia University. However, transcripts of these recordings are not accessible online. For more information see *Language and Culture Atlas of Askenazic Jewry* (Herzog, 2006). The IDS Archiv für Gesprochenes Deutsch (<http://agd.ids-mannheim.de/html/index.shtml>) also features a corpus of recordings and transcripts of Yiddish dialects.

German in Parallel Corpora

Parallel or translation corpora consist of original texts in a source language and their translations into one or more target languages. Ideally they are aligned at the sentence level. When it comes to German, there is a dearth of such corpora. For more information on parallel corpora and applicable software see parallel corpora in Uppsala (<http://xml.coverpages.org/etap-over.html>). Here follows a selection of existing resources and/or projects about to develop parallel corpora:

EuroParl is a parallel corpus consisting of proceedings of the European Parliament. It offers currently about 50 million words for each of these languages: French, Italian, Spanish, Portuguese, English, Dutch, German, Danish, Swedish, Greek, and Finnish. The original language of a document is often not transparent, therefore, the corpus is aligned on the sentence level. For some language pairs, including English–German, there are specific parallel corpora using the same dataset. EuroParl can be downloaded (www.statmt.org/europarl/).

The English/German Translation Project was carried out in the 1990s at Chemnitz Technical University. It consists of a variety of genres and features English as well as German original texts and their translations. Limited access is possible at Transcorpus (www.tu-chemnitz.de/phil/english/chairs/linguist/real/independent/transcorpus/index.htm).

GeFRPaC is a German–French reciprocal (bi-directional) corpus, aligned on the sentence level, with 15 million words in each language. It features a variety of genres. It is published by ELRA as a CD-ROM. More information is available from the ELRA Catalogue (www.language-archives.org/item/oai:catalogue.elra.info:W0031).

Concluding Remark

As for other languages, there is an abundance of special corpora, often relatively small, that have been compiled in connection with specific research projects. For reasons of space they cannot be dealt with in this entry. Unlike the Oxford Text Archive, which is a kind of clearinghouse for English corpora in Britain, there is still no comparable institution for German language corpora. Anyone searching for a particular German corpus is best advised to put a query to the Corpora List (corpora-bounces@uib.no).

Corpora: Multimodal

SVENJA ADOLPHS

Natural language collected and stored in multimillion-word corpora forms the basis of inquiry in a diverse range of disciplines. Advances in the field of corpus linguistics over the past two decades have contributed to pioneering research in many areas of communication studies and language description. However, while the analysis of large-scale text corpora can provide insights into language patterning, and can help establish linguistic profiles of particular social contexts, it is limited to the textual dimension of communication. Yet, communication processes are multimodal in nature, and there is now an increasing body of research concerned with the development and analysis of corpora that enable the user to study the speech and gestures of the participants in social interaction, and ways in which the verbal and nonverbal are inextricably linked. The impetus towards multimodal corpora recognizes that natural language is an embodied phenomenon and that a deeper understanding of the relationship between talk and bodily actions—particular gestures—is required if we are to develop a more coherent understanding of the collaborative organization of communication (see also Saferstein, 2004).

Work in multimodal communication has seen advances in both theory and practice. The theoretical starting point for much significant work has been in systemic-functional linguistics and in different subfields of psychology (see, for example, McNeill, 1985). Foundational work in multimodal communication, such as Kress and van Leeuwen (1996), has illustrated how choices of image can align with verbal choices. This work has been extended in recent years to embrace the multimodal analyses of word, image, and sound within different language varieties, including cartoons, comics, film, information leaflets, maps, advertisements, Web pages, and classroom textbooks (e.g., Baldry & Thibault, 2004, 2006). The emphasis has been on how choices of one image or camera angle or color tone can cumulatively encode particular meanings. The almost exclusive focus has been on written text. A particular challenge for current research is therefore to integrate the computer-enabled power of corpus linguistic methods with the theories and practices of multimodal linguistic research, with particular reference to the analysis of spoken discourse. In other words, one key aim of multimodal corpus linguistics is to provide computerized analyses of patterns of verbal and nonverbal meaning in ways that allow new understandings of discourse to emerge.

Human communication functions within a variety of direct and indirect “semiotic channels” (Brown, 1986, p. 409). The occurrence of such channels is affected by modes of communication that differ widely according to their form, function, and context of use (see foundational work by Argyle, 1988, and Ekman & Friesen, 1969, and more recent studies by Wilcox, 2004, and Gu, 2006). Previous studies on the relationship between language and gesture have traditionally focused on smaller data samples (see, for example, Streeck, 1994; Goodwin, 2000; Kita, 2003; and Olsher, 2004), and are often carried out in experimental settings. With the development of large-scale collections of video-recorded and transcribed interactions, we can extend the potential for research into behavioral, gestural and linguistic features. Current multimodal corpus studies focus mainly on multimodal and multimedia studies of discourse, and speech engineering and corpus annotation (Gu, 2006, p. 132).

Whatever the approach and focus of multimodal corpus research, there are a number of common challenges which relate to three key stages in data preparation and collection. These can be summarized under the headings “record,” “represent,” and “replay” (Knight, Evans, Carter, & Adolphs, 2009). Recording multimodal corpus data poses a number of issues ranging from the right camera angle to capture sufficient detail of the interaction, to more basic questions of equipment, and challenges relating to informed consent. A related priority for future research in this area is the development of tools and methods to address ethical issues; for example, to anonymize video data while still being able to extract the salient features that are the focus of the analysis. Pixelating faces or using shadow representations of heads and bodies can blur distinctions between gestures and language forms and, when taken to its logical conclusion, anonymization should also include replacing voices with voice-overs from other speakers. Ethical considerations of reusing and sharing contextually sensitive video data as part of a multimodal corpus resource need to be addressed further in consultation with end users, informants, researchers, and ethics advisors. The issues are especially acute when tools and resources are shared and Web-enabled.

Once the data is recorded, it needs to be represented in a way that allows a certain degree of alignment between the video/audio stream and the transcript of the interaction. Video annotation software, such as ELAN and Transana, can facilitate this process. The development of new interfaces is required when the aim is a corpus-based analysis of multimodal discourse representations. It is important that such interfaces include a concordance facility and allow the analyst to move between the concordance data and transcript, and the relevant point in the video. An example of such an interface is the Digital Replay System (DRS), which is a research prototype developed at the University of Nottingham (Brundell et al., 2008). The “replay” phase of the process requires careful consideration as to the extent to which the user may determine replay features (e.g., through linking search functions to predetermined coding tracks in the analysis).

Research in multimodal corpus linguistics has contributed significantly to the development of new interfaces of the kind described above and to the articulation of key challenges associated with each of the research phases (Carter & Adolphs, 2008). Most importantly, it has challenged the applicability of some of the key methods and visualization tools used within the corpus linguistics tradition, such as the analysis of concordance data, when we move from monomodal to multimodal representations.

Multimodal corpus linguistics is a relatively new area of research, and there are numerous challenges that require further investigation. They include technical issues such as the development of gesture-recognition systems, and issues of scope, such as the analysis of more than one gesture region at a time. An example of the latter would be the integration of hand and head gestures, as well as gaze, in alignment with language use. They further include theoretical questions of how gesture and language integrate and whether they can be described within a single framework. Early work in this area has generated some interesting findings as outlined above. It has also shown that some of the functional categories of language use that we have developed purely on the basis of transcribed records of discourse may have to be reconsidered in the light of new insights gleaned from the deployment of a multimodal approach. As our abilities develop in recording, storing, and analyzing ever larger multimodal corpora in an integrated manner, we may expect to see new patterns of meaning, which allow us to assess issues of scalability in relation to multimodal corpus research. Finally, advances in adding video and audio streams to more traditional corpus linguistics resources mainly based on textual records, are likely to pave the way for adding and exploring further data streams. This may include global positioning system (GPS) data or time reference to a discourse event, and could potentially include any type of data that is recorded in relation to our everyday social interactions. In this

regard, multimodal corpus linguistics is likely to have an impact on language description that goes beyond the mere link-up between language and gesture, to include a vast number of other data streams that will ultimately lead to better descriptions of language in context, and thus to better applications based on those descriptions.

Corpora: Specialized

MARTIN WARREN

In corpus linguistics, there is a distinction made between general corpora and specialized corpora. A simple, but potentially misleading, way to distinguish between these two kinds of corpora is size. The former run into tens of millions of words, such as the Bank of English (over 500 million words) and the 100-million word British National Corpus, whereas specialized corpora tend to be measured in tens of thousands, or single-digit millions, of words. However, as Sinclair (2001, p. viii) points out, the size of corpora is relative and what seemed large in the 1960s was subsequently dwarfed by those compiled in the 1980s and they, again, now seem small at the time of writing (2011). The difference between the two kinds of corpora is described by Sinclair (2001, pp. viii–x), and he argues that it is not the size of a corpus but rather the purpose for which it is created which best distinguishes a general corpus from a specialized corpus. A general corpus is designed to reveal patterns of language use for the language as a whole, whereas a specialized corpus is compiled not to aid in the description of the language as whole but to describe, for example, a specific register, genre, or variety of the language.

A key aspect of any corpus is that it is designed on a principled basis (Sinclair, 2005, pp. 2–17). Four of Sinclair's design principles—the communicative purpose of the corpus contents, what the corpus represents, the representativeness of the corpus, and the control of the subject matter by means of external criteria—are central to determining whether a corpus is made up of a wide range of spoken and written texts representing in their totality general language use, or is made up of spoken or written texts (or both) representing a specific kind of language use.

Given that general corpora are typically made up of identifiable subcorpora, it might be argued that they in effect contain a set of specialized corpora making the compilation of distinct specialized corpora unnecessary. For example, the Cambridge International Corpus (see, e.g., McCarthy & Handford, 2004) consists of a number of subcorpora (e.g., spoken British English, spoken business English, spoken North American English, legal English, business reports and documents, financial English, academic English, and a learner corpus), each of which could be treated as a specialized corpus. However, as Flowerdew (2004, pp. 14–15) points out, using the subcorpora of general corpora in place of specialized corpora can be problematic because they often fall short in terms of representativeness, size, and even accessibility, so it is often necessary for the corpus linguist to build a specialized corpus. Flowerdew (2004) offers a useful set of parameters for classifying corpora as specialized (p. 21):

- specific purpose for compilation;
- contextualization—setting, participants, and communicative purpose;
- size—1 to 5 million words;
- genre-based;
 1. type of text/discourse
 2. subject matter/topic
- variety of English.

2 CORPORA: SPECIALIZED

It can be seen that Flowerdew (2004) includes size as a characteristic of specialized corpora and, while there are some very large specialized corpora, Sinclair (2005, p. 16) notes that for the compilers of a specialized corpus a “much smaller corpus will be needed for typical studies than is needed for a general view of the language.” The reason for this is that the “number of different word forms, which is a rough estimate of the size of the vocabulary, is far less” in specialized corpora than general corpora (Sinclair, 2005, p. 16). This tendency is explained by the fact that a specialized corpus “highlights a small, probably technical vocabulary” and the “characteristic vocabulary of the special area is prominently featured in the frequency lists” (Sinclair, 2005, p. 16).

Another design characteristic which distinguishes specialized from general corpora is that specialized corpora tend to be designed for early human intervention (EHI) studies while general corpora are designed for delayed human intervention (DHI) (Sinclair, 2001, p. xi). In the case of the former, the corpus compiler has a specific goal (or goals) and builds a corpus accordingly. In the case of DHI, the researchers compiling a general corpus do not have such specific aims in mind. Sinclair (2001, p. xi) gives an example of one EHI study often conducted by those working with specialized corpora, which is to compare “proportional differences or the presence or absence of particular phenomena” which the researcher then interprets. Sinclair (2001, p. xii) cites Biber, Johansson, Leech, Conrad, and Finegan’s (1999) grammar of English which compares four specialized corpora—conversation, fiction, news, and academic with each corpus made up of 4–5 million words—as a typical EHI study. Other increasingly popular examples of comparative studies are translation studies using specialized parallel corpora consisting of translated texts aligned to enable comparisons to be made and thus “translation equivalence to be studied” (Sinclair, 2001, p. xii), examples of which are given below. Having a specific focus can also mean that specialized corpora can be used to inform language teaching. For example, “descriptions of structure, reliable models of usage, how words and phrases are translated,” determining the essentials in a syllabus, and identifying learners’ errors can all be developed and/or supported by focusing on specific genres and subgenres (Sinclair, 2001, p. xiii).

A specialized corpus, then, is typically compiled to investigate a particular register, text type, language variety, or form of language use. Here Bhatia’s (2004, pp. 30–2) definition of register is used, which relies on the notion of context of situation: the field, mode, and tenor of a discourse, whereby a register can be field dominated (e.g., scientific register), mode dominated (e.g., casual conversation), or tenor dominated (e.g., client consultation) (Bhatia, 2004, p. 32). A genre, on the other hand, represents a particular type of text (Bhatia, 2004, p. 31) such as a sales letter, annual report, or job interview. When examples of specialized corpora are reviewed, it is apparent that they are not always easy to categorize as representing primarily a register, text type, language variety, or form of language use because some are designed to cover more than one of these categories.

Selection of Contents

The selection of the contents of a specialized corpus often requires the corpus linguist to seek advice from experts in the field to ensure its representativeness and balance. Three specialized corpora compiled in Hong Kong illustrate the importance of doing this. The Hong Kong Financial Services Corpus (7.3 million words) and the Hong Kong Engineering Corpus (9.2 million words) relied on professional bodies, organizations, and individual professionals both for expert advice in terms of corpus contents and also for the texts themselves. Bhatia (2004, p. 212) built a corpus of 105 criminal and civil law cases (569,445 words) from common law countries, mainly the UK and Australia, recommended by law professors in Hong Kong. He examined the use of collocations to arrive at a grammar of such legal cases and looked in detail at the collocations of the verbs *submit*, *grant*, *reject*, and

dismiss (p. 215). Another example is the 1.3-million word research article corpus compiled by Hyland (2004, p. 91) containing 240 articles based on 30 articles from 8 disciplines. In such a project, it was important to have the advice of experts in the respective disciplines to select the texts. Hyland used the corpus to examine the use of citations, reader orientations, directive functions, self mention, and promotion (2004, pp. 94–108).

Spoken Corpora

There remains a massive imbalance between the number of corpora of written texts and those containing spoken texts because spoken language remains the most difficult kind of data to obtain and is very time consuming to transcribe. This is unfortunate given that the written language makes up only a small proportion of total language use compared with spoken, of which the vast majority is conversation. However, there are some notable exceptions, such as Sinclair, Jones, and Daley's (1970) Spoken Text Corpus of 135,000 words compiled in the 1960s and the extensively researched 500,000-word London–Lund Corpus of Spoken English built in the 1960s and 1970s (<http://khnt.hit.uib.no/icame/manuals/londlund/INDEX.HTM>). Examples of more recently compiled spoken corpora are the Michigan Corpus of Academic Spoken English (MICASE), the Cambridge and Nottingham Corpus of Discourse in English (CANCODE), and the Corpus of London Teenager Language (COLT). MICASE is 1.7 million words of spoken, mainly US, English and is another example of a corpus representing the academic register minus written academic texts. CANCODE is a 5-million word corpus of spoken UK English collected from a variety of informal settings and has been used by McCarthy and Handiford (2004) with another specialized spoken corpus, the 1-million word Cambridge and Nottingham Spoken Business English Corpus (CANBEC), to compare the two registers. Compiled in 1993, COLT (<http://www.hd.uib.no/colt/>) contains 500,000 words of naturally occurring talk between London teenagers aged 13 to 17. There are, of course, spoken corpora of languages other than English. For example, Wong (2009) compared *gei* and *bei* constructions in Mandarin Chinese and Cantonese, which closely correspond with a basic meaning of “to give” (p. 60). The study made use of one written corpus and two spoken corpora, the Lancaster Corpus of Mandarin Chinese of 15 written texts, the 300,000-word corpus of Mandarin Chinese telephone conversations (CallHome Mandarin Chinese Transcripts Corpus), and the 170,000-character Hong Kong Cantonese Adult Language Corpus of “phone-in programmes and forums on local radio” (Wong, 2009, p. 62).

Register

There are corpora which represent a register such as the corpus of computing-related texts compiled by Bowker (1998), who argues that specialized target language corpora are a better translation resource for translators than conventional lexicographic resources. Similarly, Claveau and L'Homme (2006, p. 209) describe a method for “discovering and organizing noun-verb combinations” made possible by developing a French corpus of computing texts. The description of English grammar by Biber et al. (1999) has been mentioned before and is based on four specialized corpora representing four different registers drawn from both US and UK sources (Biber et al., 1999, pp. 29–35). Hoey (2005, p. xi) describes his theory of lexical priming with examples drawn from a 95-million word corpus of news and features texts from the UK-based *Guardian* newspaper. He argues that using this specialized corpus is “an asset, not a limitation” because “working with a corpus from a single source” then “means that claims, though necessarily limited, are securely grounded” (p. xi). Another example of a news register corpus was built by De

Sutter, Speelman, and Geeraerts (2008) to investigate the reasons for grammatical variation in the “word order in Dutch clause final verb clusters” (p. 194). To do this, they used the 54-million word corpus of written Dutch which includes both Netherlandic and Belgian Dutch texts, from newspapers and the Web from the years 1958, 1978, and 1996 (p. 199). A different register, fiction, was used in a study by Brown, Tiberius, and Corbett (2007) which examined the use of Russian nominals that “exhibit both syncretism and inflectional allomorphy” (i.e., where one form has more than one function and one function has two or more forms) in the Russian Standard Corpus, which is 1.5 million words of 20th-century Russian fiction (p. 518).

Genre

Specialized corpora based on a genre have become very common and can range in size and the specificity of the text type collected. Ooi (2001), for example, compiled a corpus of 120 personal classified advertisements posted by men and women in Singapore and the USA. He investigated the use of frequently used phrases and identified *looking for* and *sense of humor* to be key phrases in the genre along with key words. He found the key words *fun* and *sex* were used more frequently by men while women were more likely to use the key word *friends* (pp. 181–2). Another example of a very specific text type is Quaglio’s (2009, p. 30) Friends corpus (604,767 words), made up of nine seasons of the well-known television program of the same name, which he compared with the 4-million word American conversation subcorpus of the Longman Grammar Corpus (p. 36). The main aim of compiling this specialized corpus was to compare the scripted conversations with naturally occurring conversations, and Quaglio uncovered substantial differences between the two. The 4-million word American conversation subcorpus of the Longman Grammar Corpus was also used in a study by Friginal (2009, p. 64) in which he compared approximately 1.1 million words of face-to-face conversations selected from the subcorpus with two other specialized corpora. He compiled a call center corpus (553,765 words) based on 500 telephone calls recorded in the Philippines. He also used a 1-million word switchboard corpus (pp. 65–7) which is part of the American National corpus. It comprises 600 calls between pairs of speakers who were matched to talk on the phone by selecting the same topic from a list of potential topics before being recorded. The latter corpus is unusual in that corpus linguists typically collect naturally occurring data for their corpora rather than contrived or experimental data.

Function-Based Corpora

Some specialized corpora contain incomplete texts. Sometimes this is in order to have strict control over the size of the corpus, and the balance of the contents, and sometimes it is because the compilers are interested in particular parts of a text. Bondi (2001, pp. 138–9) compiled two corpora made up of parts of texts. One comprises ten economics textbook introductions (71,000 words) and the other consists of 456 economics-journal abstracts (47,000 words). She compared the use of expressions “to represent argumentative activity within scientific procedures” (p. 138). The six most frequent meta-argumentative expressions in the introductions are *statements*, *questions*, *assumptions*, *disagree*, *judgments*, and *predictions*. In the corpus of abstracts they are *examines*, *state*, *discusses*, *considers*, *implications*, and *analyzes*. Barnbrook and Sinclair (2001) compiled a dictionary-definition corpus of 434,220 words which is made up of all 31,497 word senses defined in the *Collins COBUILD Student’s Dictionary* (Barnbrook & Sinclair, 2001, p. 238). They investigated and described the “restricted language of definition” and argued for “local grammars” which better

describe the grammar of the restricted language than a general grammar (p. 271). These local grammars then formed the basis for writing software capable of automatically retrieving definition sentences from corpora. Some corpus linguists have compiled more traditional specialized corpora—fund-raising letters, biology/biochemistry research articles, and university classroom teaching—and then dissected the texts into their respective discourse moves in order to compare the language found in each of the move subcorpora (Biber, Connor, & Upton, 2007).

Bilingual Lexicography, Translation Studies, and Parallel Concordancing

The use of specialized corpora in bilingual lexicography, translation studies, and parallel concordancing has become increasingly common. Santos and Frankenberg-Garcia (2007, p. 337) describe the compilation of a 3-million word parallel corpus of English and Portuguese publicly available on the Web. The corpus consists of different varieties of English (UK, USA, and South Africa) and of Portuguese (Portugal, Brazil, Mozambique, and Angola). The corpus files are based on 74 different pairs of original and translated texts which are “extracts of fiction, randomly taken from the beginning, middle or end of books” (p. 337) from the period 1886 to 2002. Parallel corpora, such as the French–German parallel corpus (Teubert, 2002), enable bilingual lexicographers to harness corpus linguistics to identify in one language “semantic conglomerates such as compounds or collocations using a combination of statistical and grammatical approaches,” (p. 204) and then their equivalents in the other language, to compile better-informed dictionaries. Teubert uses *Arbeit* and *travail* as examples and shows how they are rarely translation equivalents in the parallel corpora (pp. 205–10). Chodkiewicz, Bourigault, and Humbley (2002, p. 250) compiled a parallel English–French corpus, European Court of Human Rights, which includes the court’s own founding texts and 36 decisions made by the court. The two corpora each contain 12,131 sentences and around 300,000 words (p. 251). They found that problems of ambiguity, in terms of translation equivalents, are greatly reduced if “multiword terms” are studied because “single-word terms are often more ambiguous” (p. 253). Williams examines the “semantico-syntactic environments” of the verbs *show* and *demonstrate* and Spanish *mostrar* and *demostrar* in a bilingual corpus of medical research articles (Williams, 2008, p. 38). He uses a parallel corpus of English and Spanish texts in the study, 64 articles translated from Spanish and 64 from English and a comparable subcorpus of 64 untranslated Spanish articles, totaling 0.5 million words (p. 40). The Springer Bilingual Corpus contains a 1-million-word parallel corpus of English–German scientific medical abstracts from 41 medical journals. The corpus is aligned at sentence level and annotated for part-of-speech, morphology, chunks, semantic classes, and semantic relations.

Learning and Teaching Applications

Specialized corpora have implications for the learning and teaching of English for specific purposes, and many learner corpora (corpora of texts spoken or written by novice writers and speakers rather than by experts) are now aimed specifically at language learning and teaching. Flowerdew (2001, pp. 370–1) used a subcorpus of written reports by university students (ca. 200,000 words) which is part of the Hong Kong University of Science and Technology Learner Corpus. She found that students knew key vocabulary but were less familiar with “the lexico-grammatical environment in which the word occurs” (p. 371) resulting in “collocational mismatches.” The International Corpus of Learner English (<http://cecl.fltr.ucl.ac.be/Cecl-Projects/Lindsei/lindsei.htm>) is a written learner corpus made up

of 3.7 million words of EFL writing by university students representing 16 mother tongue backgrounds (Bulgarian, Chinese, Czech, Dutch, Finnish, French, German, Italian, Japanese, Norwegian, Polish, Russian, Spanish, Swedish, Turkish, and Tswana). Each subcorpus contains 200,000 words written by third or fourth year university students who each contribute two 500-word essays—one argumentative and the other a literature examination paper. The same team of researchers built a spoken learner corpus to complement the written corpus.

Unique Resources

There are also specialized corpora that are worth noting because of the daunting task of compiling them and the unique resource which each represents. One such corpus is the Electronic Text Corpus of Sumerian Literature (<http://etcsl.orinst.ox.ac.uk/>) which is made up of 394 texts originally written on clay tablets in cuneiform characters. The corpus comprises both transliterations and translations (English). Another is an online sign language corpus (Crasborn et al., 2007) which consists of three signed languages used in Sweden, Britain, and the Netherlands (p. 542). The corpus was built in part to determine the extent to which “current annotation conventions, metadata categories, and technical possibilities” for archiving sign language are sufficiently robust to build a larger corpus in the future (p. 542).

Multimodal Corpora

The most recent development in specialized corpora is the building of multimodal corpora. Knight, Evans, Carter, and Adolphs (2009) describe the formidable challenges faced by those compiling a multimodal, multimedia corpus. The corpus in question is the Nottingham Multi-Modal Corpus which is a multimodal corpus of spoken interaction. These challenges include saving the naturally occurring data in “three different modes; textual, spoken (audio) and video” (Knight et al., 2009, p. 2). These are then searchable via an interface which gives access to “lexical, prosodic and gestural features” (p. 2). This requires researchers to transcribe, code, and mark up gestures such as head nods and hand movements. Another of the pioneers of multimodal corpora is Gu, of the Chinese Academy of Social Sciences, who also describes (Gu, 2006) the extensive analysis required in the preparation of an accessible multimodal corpus. He included orthographic transcription, prosody, speech acts, eye gaze, body language, gestures, elaborate descriptions of participant roles, and relative positioning in a multilayered alignment accessed via a complex computer-mediated interface (p. 161). These kinds of specialized corpus are promising to open up exciting new avenues of research and the exploration of a much fuller description of meaning making.

Specialized Corpora in Other Fields

The focus above has been on the compilation and investigation of specialized corpora by corpus linguists, but there are, of course, researchers in other fields who compile and work with specialized corpora. The most notable fields are computational linguistics and natural language processing (NLP). Much of the work with specialized corpora in these fields has focused on investigating ways to build such corpora in a fully automated fashion. An example is the work of Leturia, San Vicente, Saralegi, and Lopez de Lacalle (2008) who compiled specialized computer science and geology corpora of written Basque texts from the Web using discipline-specific n-grams (i.e., two or more words which frequently

co-occur consecutively in a corpus) to identify the texts. Others have used key single-word and multiword terms as the basis to extract texts to build corpora. For example, Fairon (2006, p. 43) compiled a specialized corpus of online newspapers by using “clustering algorithms” (i.e., mathematical formulae that aim to determine the significance of word clusters) which identified specific kinds of newspaper article content. In a project involving computational linguists, corpus linguists, and critical discourse analysts, a corpus of newspaper articles about refugees and asylum seekers was compiled automatically using a method termed “relative query term relevance” (Gabrielatos, 2007, p. 5) in combination with the identification of key words to automatically extract relevant articles from electronic newspaper collections. The resulting corpus was then analyzed employing a fusion of corpus linguistics and critical discourse analysis approaches (Baker et al., 2008).

The techniques employed for the automated compilation of corpora have been developed within a broader field known as “data-mining” (see, e.g., Han & Kamber, 2006), which often involves constructing an ontology that aims to be a complete description of a specific knowledge domain (in a specific language) in terms of how it is organized, its hierarchy, and all of its constituents and their interrelationships. Automatically identifying and classifying documents on the Web, for example, requires “frequent pattern analysis” which includes association, correlation, causality analysis, and cluster analysis (Han & Kamber, 2006). Roche and Kodratoff (2006) adopted this approach when building their French curriculum vitae corpus by using a threshold for acquiring the ontology (i.e., all the relevant and related domain texts on the Web) based on statistical cutoffs.

Conclusion

Specialized corpora cover a wide range of registers, genres, language forms, and language varieties. Their number has increased thanks to a combination of the availability of hardware and electronic texts, and the higher profile of corpus linguistics. As corpus linguistics has grown, so too has the demand for more specific and targeted studies and applications, which specialized corpora are often best designed to meet. These corpora are still primarily compiled for the use of researchers, but they are also finding a more significant role in the language classroom, especially in the learning and teaching of languages for specific purposes, and in translation studies.

Corpus Analysis for a Lexical Syllabus

DAVE WILLIS AND JANE WILLIS

The Case for a Lexical Syllabus

A lexical syllabus for language learners sees lexis as central to syllabus design, aiming to cover the most frequent words and phrases of the target language, together with their most frequent meanings and uses and the combinations and patterns in which they typically occur.

The arguments for a lexical syllabus rest on the findings of corpus linguistics and were initially put forward by West (1953), who laboriously drew up *A General Service List of English Words* (GSL) by hand. Now the advent of electronic corpora affords us a far more detailed picture (see Sinclair & Renouf, 1988; Willis, 1990). An appropriate research corpus can help us identify the words, phrases, and patterns that learners are most likely to need. A general corpus (spoken and written) would suit most learners, but a specialist corpus would be required for learners who need to study or work in a specialist field (e.g., academic, business, medical).

In the 1970s and early 1980s advocates of a notional/functional syllabus tried to identify the central meanings in the language, those which every learner would need to express and understand from an early stage, and to design a syllabus around these meanings. They listed functions such as *agreeing/disagreeing* and drew up complex inventories of meanings, or notions. But there were two major problems with these inventories. First they had no empirical basis. There was no way of knowing whether a proposed inventory truly represented the basic meanings realized in the language. Second, there was the problem of identifying realizations of these notions and functions. Notions of space and time, for example, are central to all kinds of discourse, but how are they typically expressed?

In advocating a lexical syllabus Sinclair recognized that the most central meanings in the language are those expressed by the most frequent words and phrases, and these can be identified empirically by means of frequency counts based on language corpora (see Sinclair & Renouf, 1988). Given this, corpus analysis can contribute to syllabus design in three ways:

- by analyzing *word frequency*. In English (although other languages will vary), the most frequent 700 words account for around 70% of text. So 70% of all we hear, speak, read, or write is made up of a mere 700 different words. The most frequent 1,500 words account for 80% of text and the most frequent 2,500 for 86%. Figures vary slightly for different types of corpora, and informal spoken language can be 10% higher (Nation, 2001, p. 17, 2006, pp. 59–82; Hunston, 2002). After 2,500 words the coverage begins to fall off very rapidly. It takes over 6,000 words to account for 90% of text. (A “word” here is a “type”: so *go*, *going*, *went*, *gone*, etc. would all count as separate words.) These figures show that these highly frequent words and their meanings are vital for a working command of the language. But they would not be sufficient. Even with 86% coverage, roughly one word in seven would still be unknown (Laufer, 1989; Waring & Nation 1997). Learners still need key words and phrases relating to specific topic areas, so a topic-based syllabus should run in parallel with a lexical syllabus.

2 CORPUS ANALYSIS FOR A LEXICAL SYLLABUS

- by identifying the most frequent *meanings and uses of the most frequent words*. These can be surprising. The word *point*, for example, is one of the 20 most frequent nouns. Once we look at the phrases in which the word occurs (*the point is, that's a good point . . .*, etc.) we realize the important function it serves in organizing discourse. It is this use that accounts for its startlingly high frequency, rather than its more obvious meaning: *the thin sharp end of something*.
- by highlighting *typical phrases and word combinations*. Prepositions—all highly frequent—combine with frequently occurring verbs to create new meanings (*get up, get over, get out of*, etc.). Frequent adjectives collocate with a wide range of nouns: *strong* is found with nouns as disparate as *case, currency, drink*, and *possibility*. Many common verbs have a range of delexical uses; *give*, for example, is frequent with its basic meaning of *present* or *donate* but is more often found in phrases such as *give a talk, a smile, some advice*, and so on. Hunston (2002) explores more deeply the concept of “language as phraseology.”

There was a second argument in favor of a lexical syllabus. Sinclair’s work with corpora led him to postulate two principles at work in the organization of language. Traditional grammar sees language as made up of grammatical units—noun phrases and verb phrases—which combine to make clauses, which in turn combine to make sentences. So, following a structural (grammatical) syllabus, we teach students to produce and understand pattern sentences illustrating verb tenses, conditionals, comparatives, and so forth and then manipulate those frames in particular ways to achieve particular meanings. Sinclair (1991, pp. 109–10) calls this the “open choice principle”: language is made up of a series of sentence frames and clause frames; we then choose appropriate lexical items to fill out these frames. Vocabulary is treated as subservient to grammar.

But Sinclair challenges this view of grammar by drawing attention to another more important principle at work, which he calls the “idiom principle.”

The principle of idiom is that a language user has available to him or her a large number of semi-preconstructed phrases that constitute single choices . . . The overwhelming nature of this evidence leads us to elevate the principle of idiom . . . to being at least as important as grammar in the explanation of how meaning arises in text. (Sinclair, 1991, p. 110)

This view is echoed by Widdowson:

Communicative competence is not a matter of knowing rules for the composition of sentences. . . . It is much more a matter of knowing a stock of partially pre-assembled patterns, formulaic frameworks, and a kit of rules, so to speak, and being able to apply the rules to make whatever adjustments are necessary according to contextual demands. Communicative competence in this view is essentially a matter of adaptation, and rules are not generative but regulative and subservient. (Widdowson, 1989, p. 135)

So Widdowson sees grammatical rules governing verb tenses, determiners, and so on (what Willis, 2003, p. 34, calls “the grammar of orientation”) as “subservient,” simply allowing us to tailor our message more precisely to the context. Communication is predominantly a process whereby we string together pre-assembled or partially pre-assembled phrases. And it is these phrases together with the most frequent words which form the backbone of the lexical syllabus.

Specifying a Lexical Syllabus—From Words and Phrases to Meanings and Patterns

The first realization of a lexical syllabus for a general course—*Collins COBUILD English Course* (Willis & Willis, 1988)—was based on the COBUILD main corpus which, in the early 1980s, consisted of 7.5 million words of written and spoken language. This provided reasonable coverage of the most frequent 2,500 words, all of which occurred at least 120 times in the corpus.

The most frequent words have on average three broadly different meanings, and each meaning has its own typical patterns. When compiling the COBUILD syllabus, a data sheet was produced for each word, giving the main meanings and numerous examples of each pattern, with the most typical phrases. Let us look at a summary of the word *way* and its contribution to the lexical syllabus.

Way comes after *time* and *people* as the third most frequent noun in English with around 7,000 occurrences in the main corpus. Lexicographers worked with these 7,000 concordance lines to identify the main semantic fields covered by *way*:

- | | |
|-----------------------------------|--|
| 1. Method, means | <i>It's a useful way of raising revenue.</i> |
| 2. Manner, style | <i>He smiles in a superior way.</i> |
| 3. What happens, what is the case | <i>That's the way it goes.</i> |
| 4. Degree, extent | <i>In no way am I a political person.</i> |
| 5. Direction | <i>A man asked me the way to St. Paul's.</i> |
| 6. Distance, extent | <i>I flew the rest of the way to Danang.</i> |
| 7. Time | <i>National revolt was still a long way off.</i> |

In addition to these semantic areas a number of discourse uses were noted, such as:

By the way: *By the way, that visit of Muller's is strictly secret.*

Also salient were a number of syntactic frames associated with *way*:

Noun Phrase + *to* + infinitive: *The cheapest way is to hire a van.*

Noun Phrase + *of* + *-ing*: *The different ways of cooking fish.*

Noun Phrase + relative clause: *The only way a telegram can be delivered.*

So the word *way* offers input to the syllabus in three ways:

- as a word which expresses a number of central concepts,
- as a component in a large number of common phrases,
- as an exemplar of valuable syntactic frames.

Studying syntactic frames (e.g. *way of* + *be* + verb + *-ing*) can lead to other discoveries. We can identify groups of nouns which often follow the same pattern:

METHOD: *way; method; means; process*

LIKING/DISLIKING: *love; hope; hatred; fear; horror*

POSSIBILITY: *likelihood; chance; possibility; risk; danger*

OUTCOME: *result; effect; aim; intention; advantage; disadvantage*

4 CORPUS ANALYSIS FOR A LEXICAL SYLLABUS

So we move from highly frequent words such as *way* and *of* to the specification and organization of other words which exhibit similar behavior. This approach to the classification of words according to their meanings and associated patterns has been exhaustively researched and documented (Francis, Hunston, & Manning, 1996, 1998).

Once we embark on this process of analysis we begin to discover further insights which are often ignored in language-teaching materials. A look at the modal *would* is illuminating. Traditionally, *would* is treated as a component in the so-called “second conditional” with an “if” clause: *I would feel sorry for him if he wasn't such a reactionary*. But in the COBUILD main corpus only 8% of the occurrences of *would* were in conditional sentences; 48% of occurrences were in hypothetical statements without the co-occurrence of *if*:

“The Tempest” would make a wonderful film.

Most course books fail to highlight this much commoner occurrence of *would*. Another use of *would* which is largely ignored is its reference to past habits:

On my way to school I would stop and pick wild strawberries.

This use is rarely taught. Its place is usurped by *used to*, even though *would* with this meaning is roughly three times as common as *used to*.

So the specification of a lexical syllabus offers four advantages:

- It enables us to identify the central concepts that learners will need to produce and understand.
- It offers a truer reflection of the way language is structured.
- It links words to syntactic patterns and groups words according to the patterns with which they are associated.
- The process of syllabus specification obliges us to take a fresh look at the language and the way words are used.

From Lexical Syllabus to Teaching Materials

In the 1980s all the lexical research had to be done from scratch. After the publication of the *Collins COBUILD Dictionary* in 1987 it became possible to start with a frequency list and then work from dictionary entries to provide a description of the meanings, uses, and typical patterns of the target words. Nowadays, all the major ELT dictionaries are corpus based and provide a sound basis for a lexical syllabus.

The words to be learned (target words) need to be embedded in text. Nation (2001, p. 387) recommends that for optimum learning, words need to be encountered in meaning-focused contexts in normal language use. So the materials writer needs to identify relevant topics and select and create suitable texts, both spoken and written, which learners will process as part of their language course, using frequency lists and word descriptions to ensure systematic coverage of target words in course materials. These topic-related texts will obviously provide exposure to vocabulary far beyond the frequent words targeted for detailed study, moving towards the 15,000–20,000 words generally accepted as providing an adequate threshold vocabulary for reading.

This body of assembled texts forms what Willis (1993, 2003) calls a *pedagogic corpus* (Hunston, 2002). This corpus is then analyzed to see what coverage it offers of the target words and meanings, and decisions are taken as to which words or meanings (or both) are best illustrated in each text. Words and meanings are then allocated to units of work.

After devising activities and tasks which help learners to use language and engage with the texts in a meaningful way, pedagogic exercises can then be devised to enable learners to focus on the target words and their associated patterns. Further exercises will ensure these are recycled at regular intervals. The aim of all these exercises will be to familiarize learners with the target forms in the pedagogic corpus as a whole. Types of activity appropriate to this are illustrated in Nation (2008), Willis (1996, 2003), Willis and Willis (2007).

The approach in the *Collins COBUILD English Course* was to design a pedagogic corpus covering the top 700 words at the elementary level, to revise and extend these and add a further 800 words at the intermediate level and a further 1,000 words at the advanced level, making a total of 2,500 words. On average, the top 700 words have three broad meanings each—so the elementary course covered well over 2,000 meanings. An alternative approach would be to provide opportunities for an initial study of the top 300 words and their combinations at elementary level. At later stages learners would go over these words again and again, linking them progressively to further words, associating new words with the patterns based on the most frequent words. So the top 300 words would provide a constant focus, linking gradually to an increasing number of less frequent words, but constantly revising the most basic patterns of use.

The Impact of the Lexical Syllabus

These proposals for the lexical syllabus have had an impact on syllabus design in that recent approaches recognize more fully the importance of frequent words and, in particular, of phrases and collocation. Lewis's lexical approach (Lewis, 1993) emphasized the importance of lexical phrases and collocation and promoted much greater awareness of these phenomena among ELT practitioners and textbook writers, for example Dellar, Walkley, and Hocking (2005). The main difference between Lewis's approach and the lexical syllabus is that Lewis takes lexical phrases as a starting point but offers no empirical way of specifying the most important phrases. The lexical syllabus, on the other hand, starts with the most frequent words, arguing that an analysis of these words and their associated patterns will identify the phrases learners are likely to need. For more on the lexical approach see Lewis (1997), and for another view of this approach see Thornbury (1998).

Frequently Asked Questions

Does a lexical syllabus ignore the central concerns of the grammatical syllabus, such as the structure of interrogative and negative clauses and the use of different verb forms?

In fact, a lexical syllabus subsumes a very thorough coverage of grammar. Interrogative and negative forms are identified by the specification of words such as *why*, *what*, *not* and the auxiliary verbs such as *do*, *will*, and their uses. Both their form and their use are highlighted in the context of the pedagogic corpus and the texts in which they occur. Elements such as past tense are highlighted by the use of the most frequently occurring forms such as *was*, *were*, and *went*. The way in which these words are used is related to other past tense forms to build up a picture of the verb phrase in context. As we have seen in our analysis of *would*, modal verbs are likely to receive a more detailed and revealing treatment in a lexical syllabus than in traditional syllabuses. But both the syllabus and the materials designer must be aware that the "idiom principle" works alongside the "open choice principle." Basically, communication is achieved through words and phrases, and this is

the proper starting point for syllabus specification. But we must be aware of Widdowson's additional requirement that learners need to be "able to apply the rules to make whatever adjustments are necessary according to contextual demands."

Is a lexical syllabus just a list of words or does it include phrases?

As we have shown in our earlier references to Sinclair and Widdowson, the rationale for a lexical syllabus derives from recognition of the importance of phraseology and of the way language is structured around frequent phrases and patterns. In advocating a lexical syllabus, Sinclair and Renouf (1988) were quite explicit in their recognition of phrases. "For any learner of English, the main focus of study should be on (a) the commonest word forms in the language, (b) their central patterns of usage, and (c) the combinations which they typically form" (Sinclair & Renouf, 1988, p. 148).

Below is an example of how the word *fact* appeared on the list of lexical objectives in a revision unit of level 1 of the *Collins COBUILD English Course*. The examples were taken from the texts and recordings in previous units. Notice how the examples relate to (a), (b), and (c) above. Other common uses of *fact* (*the fact is . . .*, *despite the fact that . . .*) were covered elsewhere in the course, together with words such as *problem* which have similar patterns.

Fact

- | | |
|------------------------|---|
| 1. True things | Facts about Britain. |
| 2. The fact that | My 81-year-old mother is proud of the fact that she doesn't look her age. |
| 3. In fact | It was cold, in fact freezing. |
| 4. As a matter of fact | |

How can a lexical syllabus handle the complexities of the really common words?

The definite article *is*, by a long way, the most frequent word in English. But it can hardly be regarded simply as a lexical item. It carries with it a complex and highly abstract grammar. The same applies to the indefinite article. Between them they label noun phrases as given or new; specific or non specific; and so on—features which are essential to the coherent development of discourse. They present serious problems for speakers of languages like Japanese and Arabic which handle these notional categories in a very different way. So all the really common words such as *the*, *a(n)*, *of*, and *is* require detailed treatment and revision over a long period of study, not just at beginner level. Fortunately, they occur so often in any pedagogic corpus that it is easy to collect familiar examples to highlight their various uses.

Applications

The usual approach to syllabus design nowadays is to design a "multistrand" syllabus, taking account of grammar, lexis, phonology, and language functions. But the core of such a syllabus is nearly always a specification of grammatical items: Sinclair's (1991) "open choice" grammar. Proponents of a lexical syllabus would acknowledge the need for multiple strands in the syllabus but would argue for a lexical specification based on corpus analysis of the most frequent words in the language to form the basis of the syllabus.

Corpus Analysis for Operational Communication

EDWARD JOHNSON AND MARK GARNER

Operational Communication

“Operational communication” refers to the combination of communication procedures, technologies, and language systems used for a range of operationally specifiable communicative purposes, working environments, or settings (Johnson, 1990). These operations typically involve coordination of personnel, machines, data, or all of these, and have implications for law and order, health and safety, the protection of property, or all three. The professional cultures engaging in operational communication frequently transcend conventional linguistic and political boundaries (Johnson, 2002, 2003). Much of the communication occurs at a distance in environments that are fast moving, and it therefore relies to a considerable extent upon technical connectivity, for example by radio. Equally importantly, it also requires the use of language that is as clear and reliable as possible, avoiding the ambiguity and implicitness inherent in natural language. Procedures need to be imposed not only to manage the technology, but to control the language transmitted in a manner appropriate to the operational requirements.

The contribution of corpus analysis to pioneering dictionary projects such as COBUILD (e.g., *Collins COBUILD English Language Dictionary*, 1987) is well known. Less familiar is the contribution to the languages of operational communication. This entry considers that contribution to the design of operational communication systems in six different areas of professional activity: shipping, policing, air traffic, emergency services coordination, civil protection, and health care. Much of the discussion is based on commissions undertaken by the present authors over the last 30 years, which have required collaboration between experts in operational matters, computer science, and communications technology as well as linguistics. In each case the objective was to formulate practical solutions to the problems affecting communication between people operating in circumstances of high risk. The projects differ in terms of the operational settings and the form of the potential solutions, but each has required a substantial body of corpus-derived evidence.

Kinds of Communication Controls

Two well-known early operational communication projects were aimed at standardizing communication procedures for VHF radio. SeaSpeak (Johnson, 1983a; Glover, Johnson, Strevens, & Weeks, 1984a, 1988) was designed for worldwide maritime communication and PoliceSpeak (Garner, Hick, Johnson, & Matthews, 1993a, 1993b; Garner, Johnson, Hick, & Matthews, 1993; Johnson, 1993) for UK and French police at the Channel Tunnel frontier. Each involved developing a controlled grammar that permitted a more or less unlimited number of utterances and conversations. The grammars prescribed the sequencing of transmissions within a conversation as well as the structure of the transmissions themselves. They also specified standard phrases and conventions for expressing measurements and

The screenshot shows the 'LinguaNet - New Message' window. The interface includes a menu bar (File, Edit, View, Compose, To, Window, Help) and a toolbar with various icons. The form contains several sections:

- Intelligence Evaluation:** Includes dropdowns for 'B - Mostly reliable', '2 - Known personally to source but not to officer', and '1 - May be disseminated to other law enforcement and prosecution'. It also has a 'Priority: Normal' dropdown and a 'Recorded Delivery' checkbox.
- To:** The recipient is 'Kittling'.
- Intelligence assessment for message:** Set to 'B/2/1'. The 'Reason for check' is 'Vehicle(s) subject of process or investigation'.
- Vehicle Details:**
 - VRN: 'yiy9879879', Country: 'Finland'.
 - Make: 'volvo', Model: 'FH16'.
 - Main Colour: (empty), Secondary Colour: (empty), Vehicle Type: 'Articulated Lorry'.
 - VIN (Chassis No): 'digh8s670i7', Engine no: 'ufhiuhfgahtihf82547697'.
- Result of check:** A checkbox 'Include result of check' is checked, with the result 'Reported lost or stolen'.
- Owner:** A large empty text area.
- Officer in case:**
 - Name: 'parsons'.
 - Ref No.: '827498'.
 - Phone: '6609906990'.
 - Fax: '7436767986-098'.
- Additional information (untranslated):** Contains the text 'ACKNOWLEDGEMENT/ACCUSE DE RECEPTION' and 'Message of/de 05/05/04 16:55:13'. Below this is a small image of a truck with the number '134' on its side.
- Additional Messages:**

descriptions. A similar controlled grammar approach was used later for the interactive English–French machine translation authoring system Linitext (Johnson, 1990, 1996). At the other end of the scale are simpler systems, such as the phraseologies for International Air Traffic Control (Johnson, 1987; Cushing, 1994; International Civil Aviation Organisation, 2007; Civil Aviation Authority, 2009) and Vessel Traffic Control (Glover, Johnson, Strevens, & Weeks, 1984b). These consist of a set of “slot-and-fill” patterns for particular operations.

Between these two extremes are partially elaborated grammars, which comprise a smaller number of formal rules and a partially prescribed lexis, in combination with a few guiding principles that make for more efficient communication. Standardised Radio Procedures (SRP) for police analogue radio (Kent Constabulary, 1994) was of this sort, as is its 21st-century equivalent, AirwaveSpeak (National Police Improvement Agency, 2007), for police digital radio. Intacom (Johnson, Garner, Hick, & Matthews, 1996), for British and French emergency services at the Channel Tunnel, produced four interconnected solutions: detailed English and French operational language recommendations, a design for an electronic binational incident log, a bilingual operational lexicon, and prescribed bilingual emergency alert formats. The project also gave rise to the development of the first multilingual, multi-modal operational e-mail system, LinguaNet™ (Prolingua, 1993).

This system was created in the early 1990s, using corpora from police operations. It remains operational today, and enables the police of European countries to engage in cross-border operational communication using multilingual text and annotated images (Gorm Hansen, Selsøe Sørensen, & Johnson, 2002; Johnson, 2002, 2003). It uses linguistic

controls for consistency in certain kinds of messages, such as describing suspects, identifying vehicles, and tracing firearms.

A more ambitious application is being built for multinational health care. The Millennium Global Village Network (MGV-Net) (Kanter et al., 2009) is an information and communication system built upon the Open Source medical record, OpenMRS (Wolfe et al., 2006). Linguistic elements within MGV-Net and OpenMRS must be stable and usable by staff working at several levels within an international application field including community health-care workers, clinic staff, regional administrators, and the staff of health ministries. Communication between different speech communities depends on establishing equivalence in the various languages. A multinational corpus of existing records is providing the initial field data, which are then mapped to pre-existing standard codes in internationally agreed medical reference tables such as SNOMED (www.ihtsdo.org) and the International Classification of Diseases (<http://www.who.int/classifications/icd>), the object being to improve interoperability between systems and semantic coherence within the international health-care and medical research community.

Finally, some operational communication systems include little or no formal prescription, but limit the nature of the linguistic control to a series of recommendations. One example is the UK government's national guidelines for emergency call handling (Association of Chief Police Officers, 2005; Garner & Johnson, 2006). Another is an ongoing project for the UK Cabinet Office aimed specifically at standardizing the terminology of civil protection (HM Government Cabinet Office, 2010), and more generally at achieving greater uniformity in usage across the government departments, organizations, and emergency response agencies. The analysis of the corpus of civil protection literature results in lexicographical proposals, which are then subjected to professional scrutiny and modification using a wiki-style facility on a closed circuit extranet.

It should be clear from these outlines that the nature of the technology of transmission significantly influences the nature and extent of the linguistic controls. Nowadays, operations are seldom coordinated through speech alone. The transmission of textual and graphical data is communicatively more efficient than the spoken word in many contexts. Transponders fitted to aircraft (Field, 1985) and ships (McGeoch & Stawell, 1987) automatically transmit a signal announcing identity, position, and heading, thus reducing the need for radio exchanges. Special-purpose text messaging and electronic mail permit operational dialogues through the medium of text and images. The different media are also used in combination, as when a radio conversation is based on operational information available to both parties via screens. Operational communication is a constantly evolving field.

Sources

Since it deals with actual language in use, all operational communication research needs to be rooted in corpus analysis. Here, the concept of "corpus" extends beyond collections of talk-in-interaction to include diverse spoken and particularly written materials relating to the organizational, operational, technical, and professional environments within which communication occurs, and which determine its forms and functions. Such material can also provide an authentic framework for the delivery of results to practitioners who are more familiar with the language of their profession than with the language of linguistics.

In operational settings, communication is an integral part of a technical process and also the main apparatus of command and control. This means that sources specifying the operations are a fundamental part of any operational communication corpus. The manifest real-world outcome of an exchange—its operational purpose—is of central concern to the researcher. In some circumstances, the purpose is achieved if, for example, a question is

appropriately answered, a warning heeded, an item of information understood and noted, or an instruction recognized and accepted (Johnson, 1983a). In many circumstances, the criterion of achieving the purpose is physical: The airplane is at the cruising altitude; the fire team has withdrawn; the ship is changing course; police officers have begun setting up cordons; the diver is now “slacked” from the bell (Construction Industry Research and Information Association, 1982). In some operations, for example police surveillance, the operational purpose, such as the transmission of an item of information, is achieved by the communicative act itself. The objective of including operational data in the corpus is to give the researcher access both to the higher-level operational situations in which specific operations occur (the descent of aircraft, evacuation of buildings, etc.) and to the full range of detailed operational purposes which give rise to specific communicative forms: *Bring [the aircraft] to flight level one zero; Withdraw all fire-fighters from the front of the building.*

Some operational information can be inferred from a corpus of real exchanges, but this kind of corpus provides only instances: it is a poor guide to the influences that gave rise to those instances. The comprehensive prescriptions for operational communication must, as far as practicable, anticipate every eventuality, especially those which, though very rare, are high risk. These eventualities are found in operational manuals, layouts of working environments, emergency plans and procedures, inquiries into disasters, formal codes of practice, organizational structures and legislation, and the like. Much of this material may be tagged and merged within a combined corpus for ease of analysis and comparison. Experience has shown that operational detail is enhanced during consultations with practitioners and when researchers attend operations and exercises. At such times, too, unwritten influences on language stemming from professional cultures (Zimmerman, 1992) may be revealed. It is on such sources that the rationale for the communication prescriptions is based; as the historical failure of artificial languages demonstrates (Garner & Johnson, in press), without an evidence-based rationale their formal adoption, and particularly the participation of the end users, is unlikely to be achieved.

Other essential corpus resources contain the technical characteristics of the carrier technologies and regulations governing their use (International Telecommunication Union, 2004). The different technical possibilities and limitations of, for example, radio, telephone, and electronic mail make different linguistic and procedural demands. Very high frequency (VHF) or ultra-high frequency (UHF) analog radios have limited range, are subject to distortion, blocking, and interference, and are vulnerable to interception. Such impediments can often be circumvented by appropriate language and procedure. On the other hand, digital radios, now used by several services in Europe (www.tetra-association.com), allow multiple “talk groups” of users to share fewer frequencies without interference. This removes the need for language to cope with poor reception, but it creates a new requirement for procedures and language to manage talk groups. Digital signals can be routinely encrypted, which obviates the need for code words and veiled speech. Enhanced reception and security, however, are conducive to less disciplined speech, and hence a greater risk of communicative inefficiency. The need for exchange protocols and other language controls is correspondingly higher.

The advent of ancillary technologies, such as operational databases, global positioning systems (GPS), and mapping systems, has also affected operational communication, for example between police officers and control rooms. Officers can obtain unmediated access to data on suspects or vehicles; GPS combined with mapping systems provides control-room staff with the location of patrols and incident sites. Particularly significant changes have been brought about by the operational information systems which now regulate much of the work of emergency service call handlers and dispatchers (<http://www.publictechnology.net/content/14730>). Behavioral controls, such as screen layouts, templates, and questioning

sequences, together with specified terminologies, field titles, and data elements, determine forms of language that inevitably migrate into operational usage.

In sum, while language-in-use corpora are essential for operational communication research, they are not sufficient by themselves, and need to be extensively supplemented by a range of other data sources.

Corpora and Analyses

Corpora of language-in-use for these studies fall into three broad categories: transcribed speech from radio and telephonic sources, text from paper records converted to electronic form, and material imported directly from computer-mediated communication systems. There have also been remote analyses of corpora held by others. An example is the Trans-Frontier Police Messaging Project (Cross Channel Intelligence Conference and Hampshire Constabulary, 2003), which examined the direction, content, and operational outcomes of cross-border police messaging as the basis for designing new systems. Eleven police sites in seven European countries ran a Prolingua (www.prolingua.co.uk) analytical program on their own structured message corpora and were thus able to produce research data without releasing the original records. This is a valuable capacity, as operational data often contain sensitive material which may be handled only by security-cleared researchers. Alternatively, raw data may be desensitized using substitution guidelines set by linguistic researchers.

The collection, assembly, and transcription of speech corpora are essential to operational communication research when voice is one of the modes of communication, but they are logistically complex and sensitive to security controls, and hence expensive to produce. The corpora are thus typically of modest size, unlike the textual resources that have become available since the advent of word processing, orthographic character recognition, the World Wide Web, and electronic text messaging. The voice corpus for SeaSpeak in 1981, for example, amounted to 1,600 transcribed maritime VHF transmissions of perhaps 40,000 words plus 200 complete exchanges containing 20,000 more. This was a respectable speech corpus, at the time, of some 60,000 words (Johnson, 1983a). A decade later, PoliceSpeak had access to equally modest voice corpora: 80,000 words of transcribed English and French police radio and 13,500 words of written messages. By contrast, 500,000 words of written records were downloaded from police computers. Fifteen years later, the project to build a national standard for police digital radio (National Police Improvement Agency, 2007) analyzed radio exchanges from 22 UK constabularies amounting to some 150,000 words. The more easily compiled corpora of textual or computer-readable communication are valuable, particularly in the compilation of lexicons, data elements, field names and entries, and free or controlled written syntax which are part of operational communication. They must not, however, be given disproportionate influence.

The relatively small language-in-use speech corpora may be exhaustively analyzed by a combination of manual and fairly basic automated processes. As long ago as 1980 corpus analysts in the SeaSpeak project were able to produce evidence of unnecessary synonymy and syntactic variety in maritime operational communication, by annotating instances in an automated corpus (a concordance, for example), then sorting and re-presenting. Categories included such items as phrases used for making contact, signaling repeats, and giving confirmations of reception, together with functionally tagged syntactic structures—all of which are required for building a controlled operational language and procedure. Corpora also have a central role in evaluation. Real-life operational material collected before and after a communication training program can be compared to provide a measure of, for example, how communicatively effective the prescribed forms are, and the extent

to which they have been learned and used (Kent Constabulary, 1993). For these purposes, simple in-house programs based on general and selective concordancing, word counts and rankings, collocations, category tagging and sorting, and morphological identification are sufficient.

Detailed Examples

Let us illustrate the foregoing discussion by examining a few cases in more detail. It is almost thirty years since the computational re-presentation of corpora made it relatively easy to process linguistic resources for language building in areas of high operational dependency. SeaSpeak therefore qualifies as a historical milestone of corpus linguistics (Johnson, 1983b); it can still serve as a model and benchmark for other studies. Its objective was to reduce misunderstandings and inefficiencies in communication, as well as to reduce the training demands, by creating standard procedures and a simple grammar for English language radio communication in international maritime operations. Analysis of the corpus revealed that VHF conversations were conducted in a variety of sequences using a wide range of vocabulary, so an essential early step was to construct a conversation grammar for all maritime VHF exchanges. This took the form of a standard algorithm structured around three simple stages: establishing contact, exchanging messages, and terminating.

The formula is shown in steps below using Pike's tagmemic notation (Pike, 1954–60):

Ex = + cal + att +/- [+/- (+/- adc -/+ asc) + agc] +/- swo +/- rqr +/- adv + mes +
rsm +/- (+/- sco -/+ aco) +/- sby + end

where Ex = exchange, cal = initial call, att = respond to call, adc = advise VHF channel, asc = assign VHF channel, agc = agree VHF channel, swo = switchover, rqr = request readability, adv = advise readability, mes = message, rsm = respond to message, sco = state continuation, aco = advise continuation, and sby = standby.

All the steps are linguistic; they are transmissions; except "swo," which is a manual switch to another frequency. The first compulsory step, shown here as the tagmeme "cal," requires a standard utterance to alert the station called. In the corpus at least thirty variants for this simple function were found; analyzing them provided a set of candidate components, lexis, and word orders for the controlled grammar. The prescribed sequence was: identification of station name called × 2; the phrase 'this is'; station name calling × 2; the phrase 'on channel number # . . .'; the word 'over'. For example:

Elin Star GXXX, Elin Star GXXX. This is Halmsund Port, Halmsund Port. On VHF Channel 16. Over.

Each of the necessary transmission types was built in the same way, starting with the corpus analysis. The outcome is a prescription for all maritime VHF exchanges, where the process of making, maintaining, and terminating contact is treated separately from message-bearing content.

This structure contrasts with air traffic control language where, because of the very close attachment of participant, message, and operation, it is deemed safe to abbreviate the contact procedure, combine it with message bearing, and prescribe entire sections of slot-and-fill dialogue (Robertson & Johnson, 1988, p. 132):

SF 153 radar contact. Descend to flight level 220.
– Leaving flight level 310, descending to level 220, SF153.

SF153, continue descent to flight level 110, report
passing 150.

– Descending to flight level 110, SF153.

The grammar of message-bearing transmissions in SeaSpeak is based in part upon the linguistic functions identified during corpus analysis (full grammar discussed in Johnson & Garner, *in press*). As an illustration, here are four instructional messages from a (functionally annotated) corpus:

I want you at the SB buoy for two o'clock.
You should be all right if you stick to that.
We would like you just to push on the starboard.
You have to steer a course then of three two.

They are rendered (using a simple imperative verb rule) in SeaSpeak as follows:

Meet the pilot, position: SB buoy, time: one-four-zero-zero UTC.
Maintain your present course.
Push on the starboard side.
Steer course three two.

The first example indicates some other rules, such as replacing certain prepositions with specific “topic markers” for position and time; a standard format for time of day, including the convention used, ‘UTC’. The entire SeaSpeak prescription is an interlocking suite of procedural and linguistic components. The grammar specifies the structures of the exchange, the transmission, and the broadcast. Forms are strictly specified for numbers, identifications, time, measurements and quantities, and position. Standard markers are used to prefix 43 of the most commonly occurring maritime concepts, such as bearing, destination, draught, interval, range, tonnage, and visibility. There is a set of 39 standard phrases for such purposes as making and maintaining contact, controlling discourse, seeking clarification, correcting, and confirming. There are also a very few fixed-format messages, such as the standard ‘Mayday’ call. Finally, for training purposes the project provided a list of the 32 most prominent maritime operations as contexts within which to exemplify the language system.

A supplement to SeaSpeak, Vessel Traffic Control Systems (VTS) (Glover et al., 1984b), was developed for strictly controlled sea areas and ports. These are the maritime equivalent of airports, and allow abbreviated communications between ships and shore stations. Analysis of a corpus showed that a limited range of messages occurs in this context, and these, together with existing regulations and the physical and technological features of VTS systems, were converted into a prescribed series of condensed slot-and-fill reports matched to ships’ transit stages. In order to reduce the dependency on voice communication, the project also recommended a generic physical layout for VTS systems (Johnson, 1990).

PoliceSpeak adopted a similar methodology to SeaSpeak, starting with analysis of a corpus of English and French radio traffic, supplemented by operational instruction materials. Standard procedures for making and maintaining contact over VHF and UHF radios were designed. Unlike in maritime communication, however, the variety of possible police messages is considerable, and the controls in this project focused on guidance for constructing the most frequent or important types of message found in the corpus. Standard formats were introduced for certain messages, such as the situation report, the request for a vehicle or person check, and the declaration of a major incident. Standard forms were given for commonly occurring topics, including addresses, locations, directions, clock times, dates,

clothing, weapons, person descriptions, vehicles, and index numbers. To facilitate communication in the bilingual context of the Channel Tunnel, the first ever corpus-derived English–French police lexicon was developed (Garner, Hick, et al., 1993a). A set of recommendations was made for the use of police radio in the Tunnel (Garner, Hick, et al., 1993b; Garner, Johnson, et al., 1993), later adapted for more general police radio purposes (Kent Constabulary, 1994). An example follows:

Priority, Priority. This is. Papa Sierra One. Over.
 Hello Papa Sierra One. Transmit. Over.
 Priority Sitrep. Location M20, coast-bound carriageway, A229 exit. Incident, serious injury,
 RTA. Require ambulance and fire brigade. Over.

PoliceSpeak was the forerunner of the UK national standards for digital police radio in 2008 (National Police Improvement Agency, 2007), which were aimed primarily at communication between control rooms and patrols. Owing to the very limited time available for training officers to use the standards, the grammar was greatly simplified, and three levels of compulsion were introduced: “mandatory,” “use-as-required,” and “recommended.” The operationally most logical sequences for voice transmissions were adopted: for example, inverting the normal sequence of a residential address into district—area—road—house number.

Summary

Corpus analysis is integral to the successful conduct of operational communication research and to the design and evaluation of the controlled language and communication systems which are the outcome of the research. In broad outline, the process of developing a system typically goes through three phases (Garner & Johnson, 2006):

1. description and analysis of current communication practices,
2. planning and implementation of controlled communication practices, and
3. evaluation of the controlled practices.

The approach is cyclical, and the phases may overlap as the work progresses.

Corpora are essential to phases 1 and 3. In the first phase, several different types of data—and hence different corpora—are required. One type is of actual language-in-use, which can be analyzed to provide a picture of current practices; this kind of corpus has been familiar to descriptive linguists for a long time. Clearly it is desirable to make this corpus as extensive as possible, but there are limitations to what can be achieved. Operational communication practices are highly specific to individual professional fields (such as police, fire brigade, ambulance, air traffic, maritime) and often to organizations within those fields (such as an individual police force or a harbor authority). Moreover, these practices change over time as the carrier technologies and the nature of the operations change. This means that corpora cannot normally be agglomerated: A new corpus is required for each new project. Other corpora also required in phase 1 are built from written (and occasionally spoken) texts relating to the organizational environment, standard procedures for operations within the particular context, and the like. They include strategic planning documentation, professional service manuals, technological specifications, and training materials. Such sources, appropriately tagged, may be combined with the language-in-use corpus for ease of analysis. They provide the framework for understanding how communication works both as a control and as a medium of the operations.

The corpus required in phase 3, the evaluation phase, consists of real-life data of operational usage in the period after the introduction of the communication controls. Analysis of usage reveals how well the controls have been learned and utilized, and helps the researcher to identify areas in which communication inefficiencies remain, or new ones have arisen. These linguistic measures, along with objective measures of efficiency (such as data on airtime use and numbers of repeat transmissions), are used to supplement qualitative measures derived from users' attitudes toward the controls, impressions of ease of learning, and so on.

Operational communication research thus provides an interesting, and in some respects a distinctive, example of the application of corpus linguistics (broadly understood) to the solution of highly important, real-life communication problems.

Corpus Analysis in Dialectology

DANIELA KOLBE

Introduction

Dialectology is the study and description of dialect(s); the first studies in this field were conducted in the 19th century. Significant changes in methodology and research focus in the second half of the 20th century distinguish “modern” dialectology from earlier, “traditional” dialectology. Traditional dialectology focused on dialect words and their pronunciation by individuals deemed “good dialect speakers” in rural areas, widely neglecting, for instance, dialect grammar. Modern dialectology aims to represent the actual speech used in particular areas, and it consequently reveals a more representative picture of actual language that also takes into account further linguistic areas, in particular grammar, as well as external factors, such as speakers’ gender and social background. Before the second half of the 20th century, data had to be gathered, analyzed, and stored without the help of a computer, that is, in nonelectronic form. The turn towards empirical studies in modern dialectology was introduced by sociolinguistics and eventually initiated the use of large electronic corpora of texts. As the term “corpus” in general has come to refer only to electronic databases since the 1990s, the development and application of corpus analysis in modern dialectology is focused on in this entry. Most of the existing electronic corpora for the study of dialects have been compiled since the 1990s. These databases allow the analysis of the infrequent patterns of dialect syntax, which had earlier been widely neglected, but which are indispensable for a complete description of the linguistic systems of dialects.

Aims and Methods of Traditional Dialectology

Research in English dialectology first focused on dialect lexis. It comprised the collection of specific dialect words that did not belong to the standard English lexicon, such as Scottish *lassie* for *girl*, non-standard pronunciations of English words, such as the entry *tack* for *take* in Wright (1898–1905, vol. 6, p. 12), and different meanings of words, such as *angle* meaning ‘hinge’ (Wright, 1898–1905, vol. 6 supplement, p. 8). The interest in dialect lexis was inspired by comparative philology, which is mainly concerned with discovering the relationships between languages. Dialects were considered to be good sources of older words that were no longer used in contemporary English, but which display the relation to another language. An example of this is *to wend* ‘turn,’ a cognate of German and Dutch *wenden* which was still used, for instance, in the Yorkshire and Essex dialects, at the end of the 19th century (Wright, 1898–1905, Vol. 6, p. 432).

This kind of research usually resulted in the creation of atlases that showed the spread of dialectal forms. At the turn of the 19th/20th century, comprehensive dialect atlases of Germany and France were compiled (Wenker, Wrede, & Mitzka, 1956; Gilliéron & Edmont, 1902–15). The first countrywide survey in England was the *Survey of English Dialect* (Orton & Dieth, 1962–71). These atlases show the geographical boundaries of dialect forms by illustrating in which locations a specific form occurs. A map of British dialects of English would show, for instance, in which locations speakers use the Scottish word *lassie* for

standard English *girl* by isoglosses, that is, lines that divide the locations in which the word occurred from those in which it did not (see Trudgill, 2000, p. 124).

In order to collect the necessary information to produce dialect maps, dialectologists mostly interviewed older men in rural areas—the so-called NORMs (nonmobile, old, rural males)—and explicitly examined how they would pronounce a certain word, or which word they would use, usually on the basis of a questionnaire that was filled in by the interviewer (Chambers & Trudgill, 1980, p. 33). The resulting maps were thus based on corpora of the questionnaire data and of the notes reporting dialect use outside the pre-formulated questionnaire interview noted by fieldworkers (e.g., the “incidental material” of the SED).

Sociolinguistics and Modern Dialectology

The use of electronic corpora accompanied the shift from traditional to modern dialectology. The first sociolinguistic studies led to a turn towards different methods in the 1970s and gave rise to the conference series *Methods in Dialectology* (Wilson, 1972).

In his sociolinguistic studies, Labov (1966) revealed that many linguistic expressions are variable, so that speakers make use of more than one realization of a linguistic form. One famous example of such a linguistic variable is a speaker’s choice between pronouncing or not pronouncing the postvocalic “r” sounds in *fourth floor*. Labov’s studies show that hardly any speaker uses one variant at all times and that speakers’ choices of a variant are strongly influenced by external factors, such as social class, age, gender, and ethnic background. Speakers also use a wide range of speech styles, from more casual to more formal styles.

Thus, although *lassie* is a typically “Scottish” variant of Standard English *girl*, Scottish speakers of English vary between both forms, depending on the situation. Dialect usage is more likely to appear in more casual speech, typically among relatives and/or friends. In situations that involve persons who do not speak the same dialect, speakers prefer formal speech and avoid the use of their vernacular, especially of strongly stigmatized variants. Unfortunately for linguists interested in nonstandard language, their presence alone creates a situation in which it seems appropriate for informants to use more formal speech and to avoid stigmatized variants. This is known as the “observer’s paradox”: the mere observation of behavior leads to a change in the behavior, so that the event the observer would have been interested in does not take place.

The combination of different observation techniques in sociolinguistics (e.g., questionnaires vs. recorded interviews) also brought to light the fact that speakers are often not aware of or do not admit to their actual language use and are thus unreliable sources for its documentation (see Labov, 1966, p. 455). The data collected in the early dialect studies must therefore have been heavily influenced by speakers’ consciousness of being asked questions about their dialect. Depending on the speaker, this might also mean that they reported dialect words that they remembered other people using but had actually never used themselves.

Following on from sociolinguistic studies, dialectology from the 1970s consequently turned towards the description of actual speech. Instead of reporting only the locations in which speakers used, for instance, the glottal stop [ʔ] instead of [t] in the pronunciation of certain words (e.g., *better*, *but*), studies now calculated the percentage of the glottal stops in all instances of (t) in intervocalic or word-final position. The availability of the tape recorder from the mid 20th century helped to create corpora of audio recordings for phonological studies of dialects. Dialectology then also shifted from interviewing NORMs to observing the speech of more balanced samples of speakers in terms of occupation, age,

and gender. As more speakers of varying social background live in urban areas, dialectologists extended their research to towns and cities. Trudgill's study of speech in Norwich (1974) is one of the first large studies applying sociolinguistic methods and has become a milestone for modern dialectology by cofounding the subfield of "urban dialectology."

Most of the studies in "urban" dialectology in the 1970s and 80s still focus on phonological or accent differences, and they do so for a reason: all English utterances contain more phonological variables than lexical, morphological, or syntactic ones. The phoneme inventory of received pronunciation (RP) has a fixed size and is limited to 45 phonemes (Upton, 2008, pp. 240, 248). Phonemes therefore recur at relatively small intervals. Grammatical patterns and especially syntactic variables (including relative pronouns, conjunctions, and word order patterns), however, are much less frequent. For example, the double modal construction *would might*, which indicates uncertainty and can be rephrased by *would perhaps*, occurs twice in the 500,000 words of spoken English in the British component of the International Corpus of English (ICE-GB; <http://ice-corpora.net/ice/index.htm>), for example, *I would might move it now straight away* (file s1b-025). In quantitative terms this means that in over 7,000 occurrences of modal verbs the double modals constitute not even 0.1 per cent of all cases. Consequently, quantitative studies of syntax require much larger databases than studies of phonology. It is also more difficult to elicit individual syntactic structures such as *to*-infinitive or relative clauses in an interview than a particular word or the pronunciation of a sound (in a word). Moreover, nonstandard patterns in syntax, such as double modals, are often regarded as instances of "wrong grammar" and strongly stigmatized. Thus speakers try to avoid them in recorded interviews and respond in the negative when asked about their use in a questionnaire. In descriptive linguistics, however, standard English is one variety of English among other, nonstandard, varieties. Consequently, dialect grammar is considered by linguists as parallel and equal in status to standard grammar. Dialects are seen as one of many aspects in which languages vary, and this variation can represent incipient language change (see Torgersen & Kerswill, 2004).

The lack of research on dialect syntax and the resulting gap in the description of dialects was first noted in the 1980s (Edwards & Weltens, 1985). However, in order to conduct empirical studies with quantitative analyses that examine proportions of standard and dialect features in actual speech, dialectologists needed larger data samples of dialect speech which can be analyzed automatically—that is, electronic corpora. The first studies of dialect syntax were thus conducted in the 1980s (e.g., Jones, 1985) and they are not restricted to dialects of English. Much research on the syntax of Scandinavian dialects has, for instance, been conducted within the project umbrella ScanDiaSyn (Scandinavian Dialect Syntax; <http://uit.no/scandiasyn/?Language=en>) from 2002 to 2009, and several of the individual projects are continuing till after 2010 (Vangsnes, 2010).

Computer-Assisted Corpus Analysis in Modern Dialectology

The application of sociolinguistic methods in dialectology, as mentioned above, usually concerns the calculation of a linguistic variable, for example the ratio of instances of *girl* or /t/ to instances of *lassie* or [ʔ], and to possible further variants. There are different approaches to extracting these variants from the corpora.

Electronic corpora usually consist of text files. Up to the time of writing (2010), phonetic transcriptions of sound files have not been digitized, which is not surprising considering the complications involved. One such complication concerns the recognition of phonetic symbols by corpus search tools, as these symbols do not appear on standard computer keyboards. The amount of phonetic detail that could be included in a transcription (aspiration, glottalization, pronunciation of /r/, devoicing, etc.) presents another compounding

factor: many of these phonetic processes are matters of degree rather than of complete presence or absence, and might be classified differently by individual researchers. The original sound files are, however, indispensable for (re)evaluation, ideally through alignment of the text with the respective audio files, such as in the Newcastle Electronic Corpus of Tyneside English (NECTE; <http://www.ncl.ac.uk/necte/>).

In order to retrieve data from electronic corpora, a common method is to use a concordance search for particular words of interest, which yields all instances of these words from the corpus in their respective contexts. Thus, one could listen to the pronunciation of each occurrence of particular words, or analyze their meaning from the context accessible via the concordance. Concordance searches can also be used to find nonstandard language patterns, such as dialect words (e.g., *lassie*), the use of standard English object pronouns, such as *me* or *him*, in subject position (*Him's doing well*), or the nonstandard relativizer *what* (*My aunt what lives in Manchester*).

There are, however, structures that cannot be found by searching for individual words. For instance, subject–verb inversion in indirect questions, as in *She didn't know why had this happened*, appears in a large variety of forms. It can be introduced by the *wh*-question words or by any auxiliary (*have, had, was, were, is, am, are, would, should . . .*), and an adverb or adverbial phrase might occur before the indirect question. Therefore, the total number of indirect questions required to calculate the percentages of standard and nonstandard forms cannot be extracted from a corpus through the concordances of an easily restricted number of words. In order to extract as many indirect questions from a corpus as possible with a reasonable amount of effort, the most frequent verbs that introduce indirect questions (i.e., their matrix verbs) are used as means of identification. For indirect questions, these are *ask, wonder, know*, and *see* (see Filppula, 2000). In the concordances of these verbs it is possible for the researcher to identify all indirect questions.

While this method has the disadvantage of presenting the researcher with a lot of irrelevant data, such as other uses of the verbs, it also has the benefit of allowing the analysis to become more corpus-driven (see Tognini-Bonelli, 2001, pp. 65–100), as unexpected patterns can be found. In the analysis of the variation between the complementizer *that* and its zero equivalent in Kolbe (2008, pp. 90–129), for example, the concordances of the matrix verbs *think, say, know*, and *see* revealed the use of the dialectal complementizer *as*, which is hardly mentioned in the descriptions of dialect grammar (see Kortmann & Upton, 2008). Had it been possible to extract only complement clauses with zero-*that* or *that* complementizer, the dialectal variant *as* would have been ignored.

Modern dialectology makes central use of statistical software, both for descriptive statistics, which count occurrences and percentages, and for inferential analyses, which indicate whether the actual distribution could be replicated in a different sample, mostly by tests of statistical significance. In addition, inferential statistics helps to compare the influence of speakers' dialects with other factors that may influence their choice of one variant of a linguistic variable by calculating the strength of the influence of each factor, for example, in variable rule analysis (Tagliamonte, 2006, pp. 217–34). It thus allows the distinction between features of nonstandard language that are typical of a (group of) dialect(s) and features that are so widespread that they can be considered to belong to a supraregional vernacular. For instance, nonstandard *for to* is reported to occur in all dialects of English spoken in the British Isles represented in Kortmann (2008) except East Anglia (p. 485). As it also expresses a sense of purpose and predominantly appears in infinitive adverbial clauses of purpose (Kolbe, 2008, p. 273), it is probably better considered as a nonstandard feature of the general vernacular that especially occurs in nonfinite clauses of purpose than as a characteristic feature of a certain (group of) dialect(s).

While the rise of these statistical methods results from the growing importance of quantitative analysis of distributions and frequencies, qualitative analyses of small samples, which focus on the closer examination of a particular structure, are still indispensable.

From a quantitative perspective it does not make sense to analyze the distribution of only two instances of any syntactic structure. In a qualitative analysis, however, the two instances of double modals (*would might*) in ICE-GB support the hypothesis that *might* is developing into an adverb with a similar meaning to *perhaps* or *maybe* (Miller, 2008, p. 306): as in *I would **might** move it now* (ICE-GB, file s1b-025) and *I would **perhaps** move it now*.

In dialectometry, a subfield of dialectology, computational methods are used to measure how different or “distant” particular dialects are from each other. While these calculations are primarily based on the data from dialect atlases and on lexis and pronunciation, the first dialectometricians turned to corpus data for their studies at the beginning of the 21st century (Leinonen, 2008; Szmrecsanyi, 2008; Grieve, 2009), and also to the study of grammatical features (Szmrecsanyi, 2008; Grieve, 2009).

Implications of Modern Dialectology

Corpus analyses facilitated the description of dialects as complete linguistic systems that exist in parallel to, but are not in any way “worse” than, the standard. Research of this kind has had repercussions even on the United Kingdom’s national curriculum in schools. One of the aims is to teach pupils “about **how** language varies: . . . between standard and dialect forms” (Qualifications and Curriculum Authority, *n.d.*, emphasis added). This implies a didactic approach in which dialects are treated as alternative varieties for private communication, while standard language and its patterns are discussed as formal alternatives rather than taken for granted (Cheshire & Edwards, 1993).

Dialect Corpora

Most existing electronic dialect corpora were compiled since the 1990s (a list of corpora and their Web sites is provided in the reference section), some of which consist of the digitized results of earlier dialect surveys. The Leeds Corpus of English Dialects (part of the Leeds Archive of Vernacular Culture, LAVC; <http://www.leeds.ac.uk/english/activities/lavc/>) contains selected SED recordings (Klemola & Jones, 1999). The Newcastle Electronic Corpus of Tyneside English (NECTE) consists of more recent data and also data from the Tyneside Linguistic Survey. The Helsinki Corpus of British English Dialects (<http://www.helsinki.fi/varieng/CoRD/corpora/Dialects/index.html>) will (once completed) contain dialect speech from the 1970s and 1980s.

However, when dialect speakers are interviewed for other reasons than dialect study, they are not aware that their language is destined for later analysis, which should reduce the degree of attention they pay to their speech. Transcripts of these interviews are therefore useful resources for the analysis of dialect speech. The Freiburg English Dialect Corpus (FRED; <http://www.anglistik.uni-freiburg.de/institut/liskortmann/FRED/>), for instance, consists of interviews for oral history projects in Great Britain. Corpora which were not explicitly compiled for dialect analysis but contain spontaneous speech from different regions can serve to analyze dialects, as demonstrated in the two examples of double modals in ICE-GB. The British National Corpus (BNC; <http://www.natcorp.ox.ac.uk/corpus/>) also provides information on the regional origin of speakers sampled in the spoken files, and ICE-Ireland allows the analysis of Irish English.

Parts of the database of spoken German (Datenbank Gesprochenes Deutsch, DGD; <http://dsav-oeff.ids-mannheim.de/DSAv/SUCHMASK.HTM>) are also accessible to the general public, as are the maps compiled in the survey of German dialects by Georg Wenker in digitized form (Digitaler Wenker Atlas, DiWA; <http://www.3.diwa.info/titel.aspx>). The DGD, together with the German Language Archive (Deutsches Spracharchiv, DSAv) furthermore provide online access to over 20 different corpora.

Further corpora compiled explicitly for the study of regional differences in other countries are, for instance, the American Nationwide Speech Project Corpus (Clopper & Pisoni, 2006; <http://www.ling.ohio-state.edu/~cclopper/nsp/index.html>), the Spoken Japanese Dialect Corpus (University of Tsukuba; <http://research.nii.ac.jp/src/eng/list/files/GSR-JD.pdf>), the Nordic Dialect Corpus (Johannessen, Priestley, Hagen, & Åfarli, 2009), and the Corpus of Estonian Dialects (Lindström & Pajusalu, 2003).

Conclusion

Dialectology has always drawn on the collections of speakers' utterances. In their electronic form these are now known as corpora. When dialectologists began to conduct empirical studies in the tradition of Labovian sociolinguistics, the availability of large digitized corpora facilitated the turn towards the study of less frequent syntactic patterns. In addition to the connection with sociolinguistics, modern dialectology bears on various other approaches in linguistics, such as typology (Anderwald, 2002) or cognitive grammar (Pietsch, 2005). Although traditional dialectology focused on the investigation of dialect lexis, lexical analysis has become rare; it is not even addressed in the overview of British varieties of English in Kortmann and Upton (2008).

The introduction of corpus analyses to dialectology also accompanies the shift to investigations of more naturalistic data. Thus, it would be desirable to collect more data from interviews for nonlinguistic purposes in order to be able to analyze more natural dialect data.

Nevertheless, modern dialectology faces two central challenges: First, to pursue the interest in dialect syntax it will be necessary to compile much larger corpora than the ones that already exist. If a double modal occurs on average twice in 500,000 words, dialectologists would need a corpus of at least 10 million words of dialect speech to compile a database of double modals that is large enough for the analysis of their actual function and use. Second, traditional dialects are decreasing in number, while individual dialect features spread to many other dialects, a process which is probably enhanced by modern media (Durham & Smith, 2008). Due to this general process of dialect leveling, corpora of 21st-century British English are less likely to contain typical traditional dialect features. These prospective corpora are more likely to serve as a resource to redefine our notion of dialect areas, as well as understanding of dialect features, in the UK (see Trudgill, 2000, pp. 82–3, pp. 132–5).

Corpus Analysis in Forensic Linguistics

JANET COTTERILL

This article looks in two directions with respect to the use of corpora within forensic linguistics: first, the notion of small, genre-specific forensic corpora made up of both questioned or disputed texts and candidate texts; and second, the use of existing large corpora of language in a variety of specialized/individual genres which may assist the forensic linguist in his or her task. Each category of analysis is illustrated with contemporary, real-world examples and considers the advantages and disadvantages of using a corpus approach.

Definitions and Delineations of Forensic Linguistics

The growing discipline of forensic linguistics may be broadly defined as the study of language and law. Forensic linguistics is coupled with its sister discipline forensic phonetics, which, as the name suggests, deals with speaker and voice identification in data such as telephone calls, answerphone messages, and other recorded speech samples. Forensic linguistics has two principal foci of attention: the descriptive aspect and the investigative dimension.

Descriptive Forensic Linguistics

Within this domain, the linguistic characteristics of a variety of different genres and text types are described. This broadly encompasses the language of the legal process, from arrest to trial and beyond, and includes the following texts and registers:

- The police caution/Miranda and its equivalents, a text read aloud to suspects on arrest outlining rights and responsibilities (Shuy, 1997; Cotterill, 2000; Rock, 2007).
- The police interview (Heydon, 2005; Haworth, 2006).
- The language of civil and criminal trials, including examination-in-chief (direct) and cross-examination; opening statements and closing arguments; jury deliberation and verdicts (Stygall, 1994).
- Judicial language: Supreme Court judgments, reports, and appeals (Solan, 1993).
- Prison language (Mayr, 2004).

Within the written aspect of language and law a wide spectrum of text types is also analyzed:

- contracts/written laws (Tiersma, 1999),
- trademarks (Shuy, 2002),
- warning labels/signs (Dumas, 1990; Tiersma, 1999).

This descriptive aspect of the field is an obvious one for the development of genre and text-specific, specialized corpora, although in some countries, including the UK, there are restrictions placed on the availability of data from courtrooms, with many of the proceedings and resulting transcripts/recordings either difficult to obtain or nonexistent. Despite this the descriptive area is undoubtedly one where corpus linguistics can prove extremely

DOI: 10.1002/9781405198431.wbeal0238

useful in exploring linguistic characteristics of legal genres and is likely to grow in the future. Perhaps indicative of this trend the most recent book on courtroom and judicial language (Heffer, 2006) carries the subtitle *A Corpus-Aided Linguistic Analysis of Legal–Lay Discourse*.

Investigative Forensic Linguistics

The second area is perhaps the best known and longest established area of corpus analysis in forensic linguistics: This involves the analysis of texts as part of criminal investigations. Texts include the following:

- threat letters,
- suicide notes,
- fabricated confessions,
- blackmail/extortion letters,
- terrorist/bomb threats,
- ransom demands,
- e-mails,
- text messages.

The use of corpora in investigative forensic linguistics is of increasing importance. Not only is such a methodology useful for analyzing sets of texts collected by scenes-of-crime officers at the early crime investigation stage, but the resulting evidence benefits from a scientific presentation in court. This includes the use of graphs and charts, tables and statistics, which juries have been shown to find more convincing than testimony delivered in a qualitative form (Conley & O'Barr, 1990). In addition to clearly defined forensic contexts such as those detailed above, there are other, more peripheral areas where corpus linguistics is becoming an important method of investigation. As O'Keeffe, McCarthy, and Carter (2007, p. 20) attest, "authorship and plagiarism are growing concerns within forensic linguistics, for which corpora can prove a useful instrument of investigation." The Joint Information Systems Committee (JISC) Electronic Plagiarism Detection project created TurnitinUK plagiarism detection software in 2000, for example, which is used widely by UK universities, colleges, and schools.

One of the major challenges within the forensic field is usually not present in the same way for corpus constructors of more general and widely available texts such as newspaper articles or casual conversation (e.g., the Bank of English, the Brown Corpus, or the British National Corpus). As O'Keeffe, McCarthy, and Carter (2007) point out, the construction of corpora and the notion of sampling can be crucial. As they put it, "any old collection of texts does not make a corpus." Unfortunately, and frustratingly for the forensic linguist, any old collection of texts is precisely what is provided by either the police or defense solicitors, who are unaware of genre/register differences, variations in text size, and temporal factors, all of which may influence the potential of texts to be analyzed.

All the text types listed above pose a number of challenges for the analyst. The first concerns the length of the text(s) to be analyzed. In general, all of the above are typically short pieces of writing with very few extending beyond a single page or several pages. In fact, texts such as e-mails and in particular text messages frequently consist of fewer than ten words and as such represent a dilemma for the analyst. Without very much language to work on, it is difficult to establish authorship, either in terms of identification or exclusion of candidate authors. As Olsson (2004, p. 14) notes:

many forensic inquiries present too little data to justify a full-scale statistical study. Often there are no more than two candidates, as few as three attested texts and perhaps no

more than one or two questioned texts. This is why most methods described as authorship detection do not work in the forensic context.

This kind of work also involves the notion of idiolect and uniqueness of expression (see Coulthard, 2004), both of which can very effectively involve the use of corpora. However, there are additional problems with work of this kind. First, the linguist has to attempt to deal with the thorny issue of genre. Such work in general linguistics which has attempted to define the characteristics of particular genres (e.g., Biber, 1988, 1995; Stubbs, 1996) has resulted so far in only partial descriptions of stylistic characteristics associated with certain text types. Perhaps the most problematic genre of analysis in this area is that of text messaging, where samples of data are both brief and highly idiolectal.

The Use of Specialized Individual Corpora in the Authorship of Text Messages

In addition to the text types outlined above, an increasing number of crimes involve the analysis of small, specialized corpora of text messages or SMS. Here, very small features including the use of punctuation, capitalization, and abbreviation, as well as openings and closings to messages, contained in very short texts nevertheless appear to give a sense of the author's idiolect or texting style. The brevity of text types was a focus of Eugene Winter's work, who attempted to establish the threshold of text size where analysis was no longer feasible (Winter, 1996). As Coulthard discussed as early as 1993:

no one really knows how small a sample one can reliably work with, at what size significant irregularities begin to emerge, whether two samples by the same person can be treated as one larger sample and to what extent regularities vary across registers. (Coulthard 1993, p. 93)

To illustrate this principle, he cites Stubbs (1996, pp. 81–100) who, comparing two short letters of an average of only 400 words each, was able to show repeated instances of common word usage. In addition to the issue of genre or register, there is a diachronic dimension to the issue of authorship attribution; as Tomblin (2009) has also noted, underpinning authorship identification must be an assumption that an individual's idiolect (even assuming this can be established as a valid concept), remains constant across the output of an author over time.

As a relatively new genre, people's texting styles tend to show considerable variation and idiosyncrasy. In general, older people tend to write messages in full form with traditional openings and closings, as they would in e-mails or letters, whereas younger individuals are more likely to send more frequent and shorter text messages, using abbreviated forms and features such as emoticons, and tending to omit openings to their messages as well as parts of speech such as the definite and indefinite article (Crystal, 2009). These differences in style, whether related to gender, age, or other sociolinguistic variables, are becoming increasingly significant in forensic linguistic corpus evidence. In 2000, the BBC News website even went as far as to call mobile phones "the new fingerprints" in their potential as corpora of an individual's idiolectal texting style.

In a 2005 case with texting as a key evidential criterion, parallel corpora of the text messages of murder victim Julie Turner and her friend Howard Simmerson were compared. This was central to the timeline of the crime, since on the afternoon following her disappearance her partner had received the following mobile phone text which the local newspaper reported at the time: "Stopping at jills, back later need to sort my head out."

He (the perpetrator) allegedly sent this text message to Miss Turner's partner and to his own mobile phone in an apparent attempt to convince people she was still alive and to give himself an alibi.

The following day, two days after Julie had gone missing, another apparently reassuring text was received: "Tell kids not to worry. sorting my life out.[sic] be in touch to get some things" (*Workshop Guardian*, November 4, 2005). In a corpus of letters which Simmerson had written (and which therefore provided a comparative corpus), analysts found similarities to the language of the mobile-phone texts, as well as several unusual orthographic and punctuation features which were indicative of a text-messaging idiolect. Simmerson was arrested and charged with her murder. He was subsequently convicted of the murder in 2005 and was sentenced to life imprisonment. The role of his individual corpus of text messages in comparison to Julie's was pivotal in the trial.

The Use of Pre-Existing Linguistic Corpora in Forensic Linguistics

As well as the construction of sometimes necessarily opportunistic and unprincipled, but bespoke, case-specific corpora as in the example discussed above, large, pre-existing corpora of English are extremely useful for the forensic linguist in a variety of case types. This may be in an investigative role where the linguist is asked to comment on idiolectal, dialectal, or regional features of texts which may aid police officers in identifying and locating a potential perpetrator. It is also possible to use corpora to illustrate common meaning (the difference between a legal meaning and a lay person's plain understanding) of a term in (usually civil cases) disputed comprehensibility of texts. These include texts such as patient information leaflets included in packs of medication, instructions, and warnings. Failure to fully comprehend these types of texts can lead to frustration at best and even injury or death at worst.

Another sector of work for the forensic linguist is that of trademark disputes, where both usage type and frequency becomes crucial (see Shuy, 2002 for a detailed discussion of forensic linguistic analysis of trademarks). In cases such as this, access to large corpora can be invaluable since it allows the linguist to gauge a sense of the common usage of such terms and by implication the common understanding of them. Arguably the largest corpus of all is the Web—used in a number of authorship attribution cases, most famously that of the Unabomber.

Using the Web as a Reference Corpus to Catch a Killer

The case of the Unabomber in the USA spanned the 1970s, 1980s, and early 1990s and is the archetypal illustration of a hybrid approach to forensic data analysis, combining individual intuition and idiolectal features of language, with the Web acting as a reference super-corpus.

Theodore Kaczynski, a disenchanted ex-university professor of mathematics in the USA, sent 16 letter bombs to a variety of targeted individuals and institutions. His attacks increased in the level of violence used and resulted in three fatalities and 23 injuries of varying severity. He was named by the FBI as the Unabomber because of his choice of targets—universities and airlines. In 1995, a textual dimension was added to the case. Kaczynski contacted the *New York Times* with an ultimatum: he would stop his campaign if either the *Washington Times* or the *Washington Post* agreed to publish a 35,000-word manifesto he had written, entitled "Industrial Society and its Future." One of the hopes of the *Post* and the *Times*, which both agreed to publish the manifesto, was that someone might recognize its stylistic characteristics.

The manifesto contained a number of distinctive features indicative of the writer's idiolectal style. In addition to consistent self-references using the plural form *we* or *FC* (standing for Freedom Club), or both, the author also capitalized whole words as a means of indicating emphasis. Although the text displayed an idiosyncratic use of hyphenation, it was otherwise error-free, in terms of both spelling and grammar, despite the fact that the author had used an old-fashioned typewriter rather than a word processor with a spelling and grammar checker.

A short time after the manifesto was published, the FBI was contacted by David Kaczynski, who claimed that the document had been authored by Theodore, his long-estranged brother. The manifesto contained certain unusual expressions, such as a self-description of the writer as a "cool-headed logician." David Kaczynski found a set of letters dating back to the 1970s which appeared to contain similar phrasing to that of the manifesto. This is a clear and fascinating example of the power of an individual's recognition of an idiosyncratic and distinctive writing style. Following a search of Kaczynski's property, he was arrested and charged with manufacturing and sending the incendiary devices. With the possession of a further set of additional documents seized from the property, the FBI's analysis (discussed in Fitzgerald, 2004, a Georgetown graduate of linguistics and FBI agent) determined that there were multiple similarities between the manifesto and particularly a lengthy letter sent to a newspaper on a similar topic.

Following this individual analysis and discovery process, a more detailed analysis of the manifesto was subsequently conducted. The first linguist brought in by the defense argued that although the two documents did indeed share lexical and grammatical similarities, this was not surprising as they were written in roughly the same genre and on the same topic. In response, the FBI carried out an analysis of the Web, which, although significantly smaller in the mid-1990s than even 10 years later, still represented an enormous reference corpus. The FBI used the same set of 12 expressions that had been used in an analysis previously carried out for the defense. The 12 generic and non-subject-specific words and phrases were the following:

Single Lexical Items	Phrases	Lemmas
thereabouts	at any rate	argu*
gotten	more or less	propos*
propaganda	on the other hand	
presumably	in practice	
moreover		
clearly		

* This includes lexical items such as argument, argumentative, proposition, proposal, etc.

At first glance these items and phrases do not appear at all remarkable. As the defense suggested, one would expect them to appear in any argumentative text of this type. However, when the 12 words and expressions were entered into the search engine Google, a total of approximately 3 million Web hits were returned which contained one or more of them. This is an unsurprising result but was clearly extremely disappointing for the FBI's analyst (confirmed in personal communication with the special agent concerned and published by him in Fitzgerald, 2004). The query was then refined to include only those documents which contained all 12 of the search terms. This produced a remarkable result: only 69 documents on the entire Web contained all 12 of these words and phrases. Perhaps more remarkably, each hit consisted of a version of Kaczynski's 35,000 word manifesto. As Coulthard points out in his discussion of the methodology employed in the Unabomber case:

This was a massive rejection of the defence expert's view of text creation as purely open choice [see Sinclair, 1991], as well as a powerful example of the idiolectal habit of co-selection and an illustration of the consequent forensic possibilities that idiolectal co-selection affords for authorship attribution. (Coulthard, 2004, p. 433)

In addition to the corpus evidence produced from these items and phrases, one further fascinating issue emerged which relates to the concept of keyness, that is words or phrases which occur with "unusual frequency" (Scott, 1999). In his manifesto, the Unabomber reversed the order of an expression, from the more expected "have your cake and eat it too" to "eat your cake and have it too." This alternative formulation was also found in other writings by Kaczynski, but a search of the Web again found that this was a unique form not found in any other text. The concept of idiolectal features, as illustrated in the case of the Unabomber, has considerable potential in forensic casework, as Kredens (2002) discusses in detail.

Shortly before his trial in 1998, Kaczynski pleaded guilty to all charges and received a commuted sentence of life imprisonment without the possibility of parole. The Unabomber case is a powerful illustration of the potential power of using the Web as a reference corpus, albeit with many caveats and cautions.

Coulthard and Johnson (2007) discuss the case of Robert Brown in the UK, who was convicted of the murder of Annie Walsh in 1977. The alleged confession was the only substantive evidence presented by the prosecution. Brown consistently claimed the confession had been produced by the police and that incriminating sections had been inserted into his police interview. Coulthard analyzed several significant strings which occurred in both disputed texts, for example, "I asked her if I could carry her bags and she said yes." In a convincing analysis using the Web again as a reference corpus, Coulthard showed these apparently common strings do not occur at all on the Web. The appeal court found Brown's conviction unsafe, mainly due to this evidence, and he was released after spending 25 years in prison. Coulthard labels this comparative method a "corpus-assisted" approach combining expert qualitative analysis with corpus linguistic methodology (Coulthard, 2004).

For Solan and Tiersma (2004), such an approach would be admissible even under the rigorous Daubert criteria employed in American courtrooms. Daubert requires that a method be subjected to peer review and publication, undergo empirical testing, and be generally accepted by its relevant academic community. Corpus linguistics, Solan and Tiersma conclude, represents the most promising methodology currently available to linguists attempting authorship attribution.

Conclusion

With the development of large corpora of various forensic genres apparently on the horizon, the future for forensic linguistics, particularly in terms of authorship analysis in all its forms, seems to hang on computerized analysis and the development of robust statistical measures. Many forensic linguists advocate the creation of these genre-specific corpora of authentic data (in the example below, police statements), both to permit:

statistically valid statements in court and to protect [oneself] against the suggestion by hostile cross-examiners that, as any reasonable person will agree, a corpus of general conversation is irrelevant for comparative and normative purposes, because the linguistic behaviour of witnesses and suspects must change when they are making statements under oath. (Coulthard, 1993, p. 89)

In terms of effective data analysis and the fulfillment of evidential criteria, it seems clear that corpus linguistics will have an increasingly important role to play in the future detection of crimes involving language. Whether corpus-aided, corpus-assisted, or corpus-based, much of the work of the forensic linguist will involve some degree of corpus linguistic methodology and principles.

Corpus Analysis in Social and Public Policy Research

JOANNA CHANNELL

Corpus analysis can be used to research problems and issues in government and public policy. It can, for example,

- explain why people misunderstand government information documents,
- suggest how such documents can be improved,
- show how the uses of terminology differ between the general public and specialists or politicians,
- reveal the underlying assumptions and coded messages in public documents, and
- provide advice on how public institutions can best communicate with the people whose needs they serve.

Such research may be carried out as academic research (where the inspiration, methods, timetable, and aims come from the academic researcher), or it may be consultancy research or commissioned research. Consultancy research is different from academic research (although it may be carried out by academics) because the paying client (government or other public body) specifies the research question(s), the outcomes, and the timetable. And the client normally retains control of the data and the results (for detail on how applied linguistics research of this type is commissioned and negotiated, see Shuy, 1998; Roberts, 2003; Channell, 2007).

Corpus research in public policy is a relatively new area, with the first projects being undertaken in the mid-1990s (see Campanelli & Channell, 1994, 1996, for early examples). With the arrival of large general corpora of British English (e.g., the Bank of English and the British National Corpus), together with the software tools to analyze them, building a specialist corpus for a specific project became possible (Channell & St John, 1996; Channell, 1997; and see principles set out in Thomas & Wilson, 1996; Skelton & Hobbs, 1999).

The results of corpus research are valuable in the public arena and potentially helpful to policy makers because they are methodologically sound, and demonstrably objective and quantified. This is important because people with no specialized knowledge about language often believe that language use is entirely subjective and that therefore the evaluation of its effectiveness is simply a matter of personal opinion. It is also the case that policy makers, particularly those at the top of government and responsible for large areas of government expenditure, require a high level of robustness of data and findings, since they will need, in turn, to present sound arguments to government ministers. Given its evident reliability and applicability, however, corpus research remains an underused resource for policy research.

Why Do Organizations Commission Corpus Research?

The reasons for seeking specialist help from applied corpus research are often one or more of the following:

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

© 2013 Blackwell Publishing Ltd. Published 2013 by Blackwell Publishing Ltd.

DOI: 10.1002/9781405198431.wbeal0239

- The organization needs to evaluate the effectiveness of its communication with the public it serves.
- The organization has received complaints, or negative media coverage, or an external body is putting pressure on it to improve.
- Professionals with other types of expertise (often management consultants or marketing professionals) have failed to solve a particular language issue or problem.
- Applied linguistics research has been helpful before (or they have heard that it was helpful to another organization).

How Corpus Linguistics Helps Public Policy Makers to Understand the Nature of Language

One of the most important contributions that corpus linguistics can make to public policy is to explain how language works and therefore how public communication can be made effective. (Many other areas of applied linguistics, for example discourse analysis and genre analysis, can also make a strong contribution here.) Applied linguists who carry out consultancy research often encounter writers who, while they may have a sincere desire to write effectively, operate with a layperson's view of language which misleads them (Shuy, 1998, gives a good exposition of the misunderstandings he encountered in 30 years of undertaking consultancy research, much of it for the US Government; see also Channell, 2007).

For example, inexperienced writers often believe that words are "a bunch of discrete units" which can be put together in any way the writer likes (Shuy, 1998), and therefore used in any setting regardless of appropriateness. Corpus analysis has consistently demonstrated the contrary, which is that

- most words must be used in regular patterns (collocation, pattern grammar), and
- the frequency of particular words, grammar patterns, and sentence structures varies measurably according to the context and purpose of the text.

Nonlinguist readers can recognize a successful text but often lack the vocabulary and theoretical framework to explain why it is successful. Corpus analysis can help them to see that a successful text is highly structured, and that vocabulary and grammar choices follow known patterns appropriate to the text purpose.

Many writers of public documents struggle to balance brevity with simplicity and clarity. Corpus research can show that a shorter version of a text may be harder to understand because it deviates from known patterns and omits appropriate text-linking phraseology.

Another area of difficulty for many nonlinguists is the accurate identification of ambiguity and therefore the potential for misunderstanding of a text. Corpus linguistics helps by demonstrating unequivocally that a form may have different functions in different contexts. Equally a particular function may be expressed by a variety of forms. The different perspectives on and conceptions about language held by linguists and nonlinguists pose specific issues in the establishment of a productive working relationship for a research project (see Shuy, 1998; Channell, 2001; Roberts, 2003, for ideas about how to establish such a relationship).

When conducting public policy research on language issues there are, therefore, two specific challenges for the corpus linguist: first, to understand how nonlinguists understand and try to resolve language issues; and second, to find ways to communicate the insights of research in usable and understandable forms to public bodies or government (Shuy's book, *Bureaucratic language in government and business*, 1998, which contains examples of

research on Medicare and social security with government institutions in the USA, is particularly good on overcoming the challenges in this area).

Examples of Corpus Research Approaches and Methods for Public Policy Research

Researchers may exploit corpus approaches in a number of ways and will usually use them in conjunction with other linguistic research methods, such as conversation or discourse analysis. They may also draw on social research methodologies, for example focus groups, survey data, and interviews (see Channell & St John, 1996, for a project which used a suite of techniques). Corpus linguistics provides quantitative analyses which “boost the empirical value” of qualitative results (Koteyko, Nerlich, Crawford, & Wright, 2008, p. 239). For the researcher, a key advantage of commissioned consultancy research is that it often provides a highly privileged access to otherwise unobtainable text or spoken conversation data. This section outlines some examples of projects, summarizing data, approaches, and results. In particular it highlights the policy impacts of consultancy research for the public body that commissions it.

Example 1

The British government collects data on work-related training from different large-scale surveys. How can it collect accurate data about training?

The UK government commissioned this research in 1993 when government statistics showed that data from different sources reported incompatible results. It appeared that statistics on the amount and level of workplace-based training and development were not accurate. Initial research had indicated that professionals in training, education, and labor market research had a very different understanding of what is meant by training from that held by nonspecialists. The research questions investigated therefore became:

1. What do people understand by the term *training*?
2. How do people generally describe the processes of acquiring the skills, knowledge, and experience necessary to undertake their work?

To answer the first question, corpus analysis, carried out by a team at the University of Birmingham, drew on a subset of 24 million words of nonfiction corpora from the Bank of English, developed by Collins COBUILD and held at the University of Birmingham (Sinclair, 1991). All forms in the word family for “train” (i.e., *train*, *trains*, *trained*, *training*, *trainee/s*) and all associated verb forms were analyzed. The research made clear that in general British English usage, “train”

- is very often used about sports, especially in newspaper contexts; and
- where it is used about work, uses are limited (in the data considered) to those occupations requiring clearly delimited training periods (e.g., professions, being a secretary, in the military).

A separate strand of the research, consisting of interviews and focus groups with training professionals and researchers, had shown that their definition of training is very broad in that it could cover every kind of learning, informal or formal, and any experience which led someone to be able to do their job effectively. A key finding therefore was that the corpus analysis found no evidence to support this broad definition in the corpus data

examined. This was a small part of the whole project, but it already showed why asking a survey respondent the question “What training have you received?” would be unlikely to elicit an accurate response, and therefore why the national data on workforce training and skills was not reliable. (See Campanelli & Channell, 1994, for a full description of the whole project.)

The second question (“How do people talk about how they learned to do their jobs?”) was answered by building a specialist 60,000-word corpus of talk transcribed from focus groups. This showed that people draw on a wide range of expressions to describe their learning and qualifications, and tend to use *training* only to describe specific periods of classroom-based learning. For the government department which commissioned this project the outcome was to provide specialist advice to those commissioning and designing labor market research, which then led on to modifications to the design of national survey questions on work-based training.

Example 2

Why can't people understand the newly introduced UK-wide national system of vocational qualifications?

In the early 1990s the whole system of vocational qualifications and related training and education in the UK was changed. The new unified system is called National Vocational Qualifications (NVQs) and was introduced with three main aims: to improve the levels of training, skills, and qualifications in the workforce; to recognize and give credit for learning which takes place in the workplace; and to ensure that the quality of work would be the same wherever it was carried out. This would mean, for example, that every person in the UK who has the job of replacing worn tires on cars would receive similar training, gain the same qualification, and carry out the work in the same way and to the same standard. The work of analysis of different jobs, rewriting of qualifications and testing, and developing a new system of assessment took almost 10 years (for a detailed account, see Mansfield & Mitchell, 1996).

A key aspect of the new qualifications is that for every job role, there is a clear, detailed, and unambiguous written description of exactly what someone training to undertake the job would need to learn. A trainee demonstrates their learning not by undertaking written examinations but by showing an assessor that they meet this description. There was and still is, therefore, a large amount of documentation to be read and understood. While most people welcomed the new system in principle, many learners, tutors, employers, and assessors found the documentation very hard to use. They reported that it was difficult to understand and even more difficult to use for assessing competence in job performance. The government therefore commissioned a large-scale research project on why people found the documentation difficult and how it could be improved.

The corpus aspect of the research was carried out by the team at the University of Birmingham which had worked on Example 1. They built a purpose-designed 2-million-word corpus consisting of the texts of all the then-current NVQs.

The corpus analysis then consisted of comparing lexis, collocation, and sentence patterns between the NVQ corpus and various newspaper and other nonfiction corpora. This analysis showed that the “difficult” NVQ texts exhibited

- high frequency of never previously identified collocations,
- high frequency of everyday words used with novel meanings unknown to readers,
- inappropriate vagueness and inappropriate overspecification,
- low frequency of normal links and discourse markers,
- inappropriate brevity.

All of these are text features which experienced readers are normally able to process. It was the high frequencies and the presence of all of the features together which made the texts so hard for most readers to understand.

In this piece of consultancy research the team was able to do three things that were helpful to the government department that commissioned the work. The research

- showed that NVQ texts are a distinct genre,
- identified 16 different linguistic features which were causing problems to readers, and
- recommended strategies for rewriting and redeveloping the texts.

The results and recommendations were well received because the findings were backed with the presentation of quantitative data from comparative analyses of different corpora. It was clear that these were not subjective opinions about the texts. Apart from making the results convincing, this had the positive outcome that the researchers avoided alienating the writers and developers of NVQs by criticizing their work. The applied linguists showed that they understood the constraints of the NVQ writing task and the strategies used to accomplish it.

There were many other strands to this highly complex piece of research. Importantly, the research fed into the government's national review of the NVQ system, led to specialist training for those who would be redrafting the documentation, and resulted in a good practice manual for writers (see Channell & St John, 1996; St John & Channell, 1996; Channell, 1997).

Example 3

How are individuals and people situated in British government and European Union policy documents on adult learning?

This academic corpus research used 950,000 words of government and academic publications on lifelong learning, presenting a concordance-based analysis of *individuals* and *people* (see Piper, 2000a, 2000b). The approach was to compare the purpose-designed corpus with an existing general corpus (the British National Corpus). The research found that "close analysis of a corpus can provide valuable evidence for the constituent potential of language in theories of society and culture, and that the differences revealed between 'individuals' and 'people' demonstrate that the discourse of lifelong learning has close affinities with contemporary sociocultural models of individualization, consumption and production" (Piper, 2000a, p. 515).

A similar approach has been applied to the discourse of other areas of public policy. For example, Koteyko et al. (2008) built a corpus of 174,000 words to present an analysis of the discourse of British government policy on measures to combat MRSA (methicillin-resistant *Staphylococcus aureus*, which is resistant to antibiotics of the penicillin class).

Example 4

What happens when people in the UK with a health problem telephone a free telephone advice line available from the National Health Service?

A growing area of corpus-based research is within the well-established field of research on health discourse (e.g., between patients and doctors). One example (Adolphs, Brown, Carter, Crawford, & Sahota, 2004; Adolphs, Atkins, & Harvey, 2007) analyzes the language of call center staff who need to understand the health problems of people who telephone them. The researchers constructed a specialist corpus of 61,000 words of recorded telephone

calls. One finding was that an identified set of conversational features were more prominent in the data than in general spoken British English: imperatives, pronouns, vague language, and affirmations and positive back channels (e.g., “right” or “okay”). The researchers identified these features as indicating an “involved and interpersonal” style. The outcome of such work is to improve the ways that health professionals communicate with patients (see Adolphs et al., 2004).

Reporting of Results and Outcomes

Having sought specialist corpus research and consultancy, policy makers normally require a report, which will be different in content, organization, and style from the reporting of research in an academic journal. A consultancy report needs four main areas of content:

- a clear analysis of the present situation and the reasons for carrying out the research, avoiding technical language as much as possible;
- the main findings, with justification of the analyses but without large amounts of linguistic research evidence—the evidence will usually appear in appendices, not in the main text;
- a clear exposition of what is working and what needs to be changed; and
- specific pointers that can be used to make improvements.

However valid the results, and however carefully tailored the report may be, commissioning organizations will not necessarily react favorably. Sometimes organizations will welcome the report and recommendations and set about making changes. On other occasions, they may not like the results. People may misunderstand the corpus results, fail to value the insights gained, or specifically work against implementation of the suggestions (for the US context, see Shuy, 1998, for some penetrating analysis of how and why this can happen to a linguistics project).

Current Issues

There exists an immense potential, worldwide, for greater application of corpus research in the arenas of public and social policy, government information, and investigation of how governments and institutions can best communicate with the people they serve. The basic methodology of building a specialist corpus for analysis (including, where appropriate, comparison with a general one) will always provide reliable research conclusions. These conclusions are then of value to policy makers because they are clearly objective. It is the case, however, that applied corpus analysis is not widely recognized outside the immediate field of related disciplines. This will need to change if it is to realize its potential as a practical tool in social and public policy research.

Corpus Analysis in Translation Studies

DOROTHY KENNY

Introduction

Translation normally involves the production of a written text in a target language based on a previously existing written text in a source language, while its sister activity, interpreting, usually involves spoken (or sign) language. Translation and interpreting have been carried out for millennia, and today form part of a multibillion dollar industry. This large-scale activity has been matched since the late 20th century by significant growth in translator training programs worldwide. What this means is that translation studies, the branch of scholarship that attempts to account for translation and interpreting phenomena, has to deal with an expansive field of enquiry and thus draws on a wide range of methodologies, including those supplied by corpus linguistics. The use of corpora in translation studies is, in fact, a relatively recent phenomenon, one that gained impetus with the publication of Baker's (1993) seminal article on the subject. Since then, corpus analysis has been adopted mainly in predominantly descriptive studies of translation, and in the more applied areas of translator education and the evaluation of resources used in corpus-based machine translation. Before discussing individual studies in these areas, I will say a brief word about the types of corpora such studies draw on.

Corpora in Descriptive Translation Studies

Translation scholars make extensive use of standard monolingual general reference corpora, often to ascertain what is "normal" for the source and target language (see, e.g., Kenny, 2001; Philip, 2009; Stewart, 2009). They have also created special corpora of texts *translated* into a single language. Such corpora are called monolingual translational corpora. When a monolingual translational corpus is juxtaposed with a comparable set of texts (in terms of genre, publication dates, domains covered, etc.) originally written in the same target language, we have what is known as a monolingual comparable corpus. An early example is the corpus used by Laviosa (1998) in her mainly quantitative investigation of translated English. Using word listing software, Laviosa found that her sample of translated English displayed a higher proportion of grammatical words, a higher proportion of high-frequency words, greater repetition of high-frequency words, and less variety in the lemmas most frequently used, than her comparable sample of original English. These "core patterns of lexical use," she suggests, are consistent with the simplification hypothesis (Blum-Kulka & Levenston, 1983), the idea that translated texts are often simpler than other texts in the same language. Simplification has been proposed as a recurrent, or more controversially, "universal" feature of translation. Other proposed translation universals, including explicitation, have been the particular focus of further studies based on monolingual comparable corpora, and these are discussed below.

Perhaps the best known monolingual translational corpus is the Translational English Corpus (<http://www.llc.manchester.ac.uk/ctis/research/english-corpus>). TEC contains some 10 million words of English translated from a variety of source languages, covering mostly

literary and journalistic genres. By comparing TEC to a comparable selection of original English texts from the British National Corpus (BNC) (www.natcorp.ox.ac.uk), Olohan and Baker (2000) found that translators into English use optional syntactic elements such as subordinating *that* in reporting structures significantly more often than other writers in English, a finding the authors argue is consistent with the idea that translators tend to be explicit in places where other target-language writers tend to leave information implicit. Olohan and Baker link this tendency to the cognitive complexity of translation, but their monolingual methodology cannot rule out the influence of source texts. A follow-up study by Kenny (2005), however, showed that English translators of German fiction use reporting *that* significantly more often than would be predicted on the basis of the distribution of the analogous form *dass* in the German originals, thus suggesting that source texts are not the main trigger for explicitation. Another significant finding based on studies using TEC is that translators tend to use contractions (*don't*, *here's*, etc.) less than, and in different ways to, other writers in English (Olohan, 2003). While this might suggest that translations are more formal than other texts in English, Olohan points to other factors that may also be at play, including the style of the original author and the translator, and the possible effects of explicitation.

Scholars in Finland have replicated the TEC research design to investigate the specificity of translated Finnish. Tirkkonen-Condit (2004) finds that certain elements that are specific to Finnish, namely verbs of sufficiency (e.g., *mahtuu* 'is small enough') and some clitic particles, are under-represented in texts translated into Finnish compared with texts originally written in Finnish. This finding is interpreted as evidence to support her Unique Items Hypothesis, which proposes that target-language specific items will be under-represented in translated texts because source texts do not provide adequate input to trigger their use. Other work has shown that some linguistic features, for example multi-word units combining *haluta* 'to want to' with verbs meaning 'to say', 'to demonstrate', 'to emphasize', etc., are over-represented in translated Finnish (Mauranen, 2000). These findings are of particular significance for languages in which a high proportion of the texts published are translations and suggest useful ways in which the influence of translation on the development of such target languages can be tracked.

Translation studies scholars also use parallel corpora, that is, collections of source texts alongside their associated target texts in one (in the case of bilingual parallel corpora) or more (in the case of multilingual parallel corpora) languages. Parallel corpora, also known as "translation corpora," are usually aligned at sentence or, failing that, paragraph level. This allows users to conduct bilingual concordance searches using programs such as ParaConc (www.athel.com/para.html) or Multiconcord (<http://artsweb.bham.ac.uk/pking/multiconc/cfl.htm>). Similar to the studies based on monolingual comparable corpora discussed above, parallel corpus studies are sometimes designed to pursue what are hypothesized to be recurrent features of translation. Øverås (1998), for example, interprets the greater use of cohesive devices in translations compared to source texts in the English-Norwegian Parallel Corpus as evidence of explicitation in translation, and observes that the explicating tendency is operational in translation from both English to Norwegian and Norwegian to English.

Normalization is understood here as the purported tendency among translators to use more standard formulations in the target language than are warranted by the source texts they translate, or to overuse patterns that are typical of the target language. Kenny (2001) investigates lexical normalization in a corpus of German literary texts translated into English, focusing on the translation of creative words that occur only once, creative collocations, and creative writer-specific forms in the German. Instances of these features were identified with the help of the WordList program and related cluster and keyword functions in an early version of WordSmith Tools (www.lexically.net/wordsmith), and

Multiconcord was then used to extract their translations into English. Kenny finds evidence of normalization, but she also uncovers many cases of ingenious translation and identifies habits of individual translators.

This shift from a focus on global patterns in translation, as exemplified by the monolingual work referred to above, to a focus on the styles of individual translators is continued in other work based on parallel corpora (although, see Baker, 2000, for an analysis of translator style using a monolingual methodology). Thus, Saldanha (2005) uses works of original Spanish and Portuguese fiction and their translations by either Margaret Jull Costa or Peter Bush to isolate features of each translator's style. Taking a corpus-driven approach in which an initial quantitative analysis is used to suggest fruitful lines of enquiry, Saldanha identifies the use of italics for emphasis as indicative of Jull Costa's style and the use of source-language words in target texts as indicative of Peter Bush's style. She interprets Jull Costa's use of typography as evidence that this translator prioritizes readability in translation. Saldanha goes on to relate translation strategies to each translator's positioning vis-à-vis his/her target audience, as ascertained through interviews and the translators' own writings. Winters (2009) analyzes two contemporaneous translations into German of F. Scott Fitzgerald's *The Beautiful and Damned*, one by Renate Orth-Guttman, the other by Hans Christian Oeser, and shows that the translators differ considerably in their choice and use of individual modal particles. Winters's subsequent qualitative analysis takes a pragmatic approach, discussing the modal particle *wohl* according to its communicative function, its role in speech and thought acts and in the narrative, and its use in establishing narrative points of view. Bosseaux (2007) also studies point of view, this time in non-contemporaneous translations into French of Virginia Woolf's *To the Lighthouse* and *The Waves*. Point of view is operationalized in this study through deictic uses of personal pronouns, adverbs of time and space, use of tenses, among other textual elements.

The above are good examples of studies that would probably never see the light of day without electronic corpora: some are based on very large volumes of data, for example, thousands of instances of features that occur very commonly in texts (personal pronouns, German modal particles, etc.) where such volumes could not be handled easily without computational assistance; some revolve around phenomena that are defined by their distribution (high-frequency words, writer-specific forms, etc.), and so could not be identified without quantitative analysis of an empirical base. These studies also illustrate how corpus analysis in translation can draw on ever expanding sets of data, with comparative data for studies of translated language being drawn from general reference corpora for the same language, and external corpora being used to establish how typical something spotted in one's own smaller parallel corpus is of the source or target language in general. What is more, they illustrate how scholars in corpus-based translation studies are increasingly integrating concepts from areas such as cognitive linguistics, pragmatics, narratology, lexical semantics, collocation studies, cultural studies, ideology, and even typography to enrich their analyses of corpus data. And although these studies are associated in particular with the branch of translation studies known as "descriptive translation studies," it is clear that the agenda they pursue goes beyond description, and even subsequent explanation. By drawing attention to the specificity of translated language and to the agency and "voice" of individual translators, scholars in the area help to make translation and translators visible, thus contributing to an agenda of translator empowerment. Apart from serving this political end, the studies surveyed above also suggest ways in which translation criticism can expand. Finally, while it is true that literary texts have predominated in the studies mentioned so far, this bias is corrected somewhat in more pedagogically oriented corpus-based translation studies (discussed below), which often draw on corpora of specialized "technical" texts.

Corpora in Translator Education

The ability to compile and use corpora is now considered part and parcel of the core competences that translation graduates should have, and some sources focus on teaching student translators to conduct effective searches in corpora provided by the teacher, or indeed to create and query their own ad hoc corpora, assembled to support decision-making during a particular translation commission and often jettisoned afterwards.

The teaching of translation “proper” has drawn on a variety of corpus types. Teachers may use source-language general reference corpora to provide extra information about problems that students encounter in source texts, or even to problematize aspects of source texts that students have taken at face value. Stewart (2009), for example, shows how data from the BNC can be used to back up the teacher’s intuition that certain words (e.g., *chill*) or even lexicogrammatical structures (e.g., *X was near.*) carry connotations of fear and foreboding, thus steering students’ translations of an extract from James Joyce’s short story *The Dead* in a new direction.

Zanettin (1998) shows how bilingual comparable corpora, that is collections of source- and target-language texts that cover the same domains, text-types, time periods, etc., but are not related to each other through translation, can be used by students to evaluate the behavior of target-language units that are similar to discourse units in the source text they are trying to translate. In such cases students often discover that cross-linguistic cognates or other perceived equivalents are not used in the same types of environments in the two languages, and they thus adjust their translations accordingly. Zanettin shows this effect for both general and specialized medical translation. Corpas Pastor and Seghiri (2009) likewise show how a bilingual comparable corpus of travel insurance documents can help guide translation practice in the classroom.

Monolingual target-language corpora are particularly helpful for those (be they students or professional translators) who have to translate into their non-native language, as they provide evidence of “natural” ways of expressing ideas in the target language. But even those translating into their native language often need this kind of assistance, especially if they are translating in highly specialized domains in which they have not received formal education. In particular translators can use concordancers to extract terminological, collocational, and even conceptual information (in the form of definitions, etc.) from specialized target-language corpora (Bowker & Pearson, 2002). Such corpora also provide backup to teachers who have to evaluate student translations, as they provide hard evidence of what is common or natural in the target language, thus taking some of the burden of proof off the teacher’s own subjective judgment. Maher, Waller, and Kerans (2008) argue that specialized target-language corpora also provide excellent resources in the continuing professional development of translators, revisers, and editors.

Parallel corpora, on the other hand, can be used to demonstrate the type of solutions that translators come up with when faced with problems that *only* arise in translation, so there is not much point in looking for guidance in a target-language reference corpus whose texts were created in a monolingual environment. Pearson (2003) shows, for example, how culture-specific references in a corpus of *Scientific American* articles are dealt with in translation for publication in French in *Pour la Science*, stressing how professional translators make decisions based on assumptions about their target readers’ cultural knowledge.

Corpus Analysis in Machine Translation

Contemporary machine translation is predominantly corpus-based, with statistical systems learning bilingual “translation models” and monolingual “language models” from previously

existing parallel corpora and target-language corpora respectively. Machine translation researchers in general do not scrutinize the contents of their corpora, and the common idea persists that more data is better data. Some scholars, however, have conducted analyses of smaller parallel corpora used for training specialized systems, such as those intended for the translation of subtitles (Flanagan & Kenny, 2007; Volk, 2008). This “profiling” typically aims to measure average sentence (or segment/subtitle) length, lexical variety, and the amount of repetition at segment level, as all of these attributes might be expected to impact upon the quality of output produced by machines that essentially “recycle” previous human translations.

In conclusion, corpora have become vital resources in translation research, translator education, and machine translation development, serving both theoretical and more applied instrumental goals.

Corpus Analysis of Business English

BETTINA FISCHER-STARCKE

International business has greatly increased over the past decades, and business transactions are frequently carried out in English. As a result, the study of business English has become an increasingly popular and important field of research with applications in teaching (e.g., Brown & Lewis, 2002) and consultancy (e.g., Baxter, Boswood, & Peirson-Smith, 2002). The term “business English” usually refers to language used in a commercial setting, for example by and with profit-oriented companies. The text types of the genre include both written and spoken language, such as letters, emails, reports, and replies to customer enquiries.

For research purposes, corpora of business language, in particular business English by native and non-native speakers of the language, have been built. Some of these are publicly available, for example:

- Business Letter Corpus (Someya, 2007a; <http://www.someya-net.com/concordancer/index.html>) and Learner Business Letter Corpus (Someya, 2007b; <http://www.someya-net.com/concordancer/index.html>); according to Lee (2009), the Business Letter Corpus consists of “1,020,060 word tokens of U.S. & U.K. samples, as of 1 March 2000. Also searchable (separately): a non-native English corpus of business letters written by Japanese business people,” while the Learner Business Letter Corpus consists of “209,461 word tokens in 1,464 letters written by Japanese business people.”
- Enron Corpus (<http://www-2.cs.cmu.edu/~enron/>), which contains about 500,000 emails by about 150 users, mostly senior management of Enron. The dataset was made publicly available during the US government investigation of Enron’s business practices.
- Hong Kong Financial Services Corpus (<http://langbank.engl.polyu.edu.hk/HKFSC/>). In July 2009, this contained 6,727,791 words of texts collected from the Hong Kong financial services sector.
- Japanese Business News Text (Graff & Wu, 1995; <http://www ldc.upenn.edu/Catalog/CatalogEntry.jsp?catalogId=LDC95T8>), a corpus of Japanese-language business and financial news. Approximately 30 million words are taken from the morning edition of *Nihon Kezai Shimbun*, the largest Japanese financial news daily newspaper; a smaller part of the corpus comes from the Japanese edition of the financial newswire *Dow Jones Telerate*.
- VOICE corpus (<http://voice.univie.ac.at>), the Vienna–Oxford International Corpus of English, which represents English as a lingua franca (ELF). Two of the domains included in the corpus, namely *professional business* (203,407 tokens) and *professional organizational* (354,545 tokens), are ELF business English. Data belonging to these categories can be extracted and searched separately from the rest of the corpus.
- Wolverhampton Corpus of Business English (<http://www.elda.fr/cata/text/W0028.html>), which consists of about 10.2 million words of written business texts from the World Wide Web collected within six months from 1999 to 2000. The texts come from 23 different Web sites of native and non-native English-speaking countries.

In addition, Nelson (2004) provides access to data generated from his Business English Corpus (http://users.utu.fi/micnel/business_english_lexis_site.htm). Moreover, the Cambridge and Nottingham Business English Corpus (CANBEC) (<http://www.cambridge.org/elt/>

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

2 CORPUS ANALYSIS OF BUSINESS ENGLISH

corpus/corpora_canbec.htm) consists of one million words of spoken data from native and non-native speakers of English mostly in the UK. This corpus, however, is owned by Cambridge University Press and is not publicly available.

This relative scarcity of corpora is due to companies' confidentiality and privacy concerns with regard to their correspondence or communications. Legal issues such as copyright, trade secrets, and infringements of personal rights make companies understandably reluctant to permit public access to their documents. Consequently, a number of linguists have compiled private business language corpora for which they were individually granted permission by the relevant companies, but which are not accessible to other researchers.

The list of corpora above reflects a bias toward written language, which is also reflected in research on business English. Moreover, corpus linguistic research often emphasizes lexis and phraseology, with pragmatics and usage being analyzed less frequently. Exceptions are Connor and Upton (2004) and Henry and Roseberry (2001). Corpus linguistic studies of business English have been conducted by, for example, Collins and Scott (1997) and Sardinha and Barbara (2008) (see Suggested Readings for further studies).

A major practical application of research into business language is the design of teaching materials. Since English is often the language of international business, it is frequently used by non-native speakers in professional interactions. Consequently, teaching business English to non-native English-speaking business students to prepare them for their future careers is an essential part of their education. The textbooks used in business English classes usually focus on both business-specific and non-specific language features such as

- terminology, for example *brand image*, *GDP* (Mascull, 2004), *direct mail*, and *sponsorship* (Brook-Hart, 2006);
- phrases to be used in a business context, for example in presentations, in reacting to follow-up questions (Harding & Taylor, 2005), and in describing survey results (Farrall & Lindsley, 2008);
- general vocabulary, for example phrasal verbs, here called "multi-part verbs," such as *point out* and *call on* (Trappe & Tullis, 2005, p. 36) and phrases for expressing disagreement (Powell, 2009).

These words and phrases reflect the authors' intuitive perceptions of characteristic linguistic features of the genre of business English, since, with the exception of Mascull (2004), none of the textbooks reviewed for this entry refers to corpus data.

The textbooks mirror a trend in research on business English toward focusing on lexis and phraseology and to put less emphasis on usage and pragmatics. The categories of lexis and phraseology taught include

1. general business vocabulary, that is, words or phrases that are used both in business and in everyday situations, such as *paid* or a phrase asking for clarification;
2. core business vocabulary, that is, terminology such as *investment*;
3. topic-specific vocabulary, that is, words and phrases that are specific to a particular business context, such as *hedging transaction risk*, a term relating to the stock market.

The focus on characteristic lexis and phraseology of business English in teaching materials reflects insights gained in previous linguistic research that some words and phrases are more characteristic of one genre or register than of another: see for example Coxhead (2000, 2002) on characteristic lexis of academic English, and Biber, Conrad and Cortes (2004) on lexicalized phrases of academic English.

Consulting a corpus for the design of teaching materials gives a grounding on which to make a decision about which words and phrases are particularly useful for students to

learn, and should therefore be included in the teaching materials. This is based on authentic data used in a business context, as opposed to an author's intuitions about the register. Unlike intuition, corpora allow us to identify those words and phrases which really are most characteristic of the register as objectively as possible. On the corpus linguistic principle that equates frequency with importance in language (Sinclair, 1991), the most frequent words and phrases of a register, as represented by the corpus, are perceived to be its most characteristic. They are therefore necessary features for the students to learn. Also, the principle of language teaching that frequent items should be taught before infrequent ones (West, 1953; Nation, 2001) supports a choice of words and phrases on the basis of their frequencies in a corpus for teaching purposes. The following analysis therefore demonstrates one way of identifying these items and of generalizing from them appropriate teaching content for business English courses for non-native speakers of English. Because of constraints on space, however, their conversion into actual teaching materials is not discussed in this entry. For the same reason, the focus of the analysis is on lexis and phraseology with the pragmatics and usage of the lexis and phrases being only minor considerations. This also reflects the main trends of research in business English.

The analysis uses the Wolverhampton Corpus of Business English (henceforth WCBE), since its compilation ensures that it gives an overview of the language used in written international business transactions by speakers of different mother tongues. This mirrors the majority of situations for which non-native English-speaking students of business English classes require English in their future working lives, that is, writing documents in English which are read by native and non-native speakers of English. Spoken interactions in English are likely to be less frequent in their future professional environments. The software used for the analysis is Word Smith Tools (Scott, 2007) and *kfNgram* (Fletcher, 2002).

Using such data and software guarantees that the results gained from the analysis are as independent of the researcher's intuitions as possible, and ensures that teaching materials reflect the real language usage in business interactions as opposed to how authors of teaching materials think it is used. Consequently, the findings on relevant units of teaching gained in the following analysis differ in part from the foci of current textbooks.

One way of identifying characteristic words and phrases of business English to be included in teaching materials is to extract quantitative key words and the most frequent phrases of the corpus. Quantitative key words are words which are statistically more salient in a corpus than in a reference corpus. Key words are identified on the basis of their relative frequencies in comparison to another set of data, as opposed to their raw frequencies. Phrases below are (a) uninterrupted phrases of n words, called n -grams, or (b) phrases of p words that are variable in one slot, called p -frames. The phrases are identified on the basis of their frequencies of occurrence without any semantic or pragmatic criteria. The key words are identified by comparing the WCBE with the British National Corpus (BNC), a 100-million-word corpus of general English. This comparison identifies those words which are characteristic of business English as compared to general English. The classification of a word as business-specific was, in the first step of the analysis, an intuitive process. In the second step, concordance lines of the words in question were analyzed and those words which occurred in a business context in at least 50% of the concordance lines were retained on the list.

The identification of both key words and the most frequent phrases in the corpus is based on the automatic and quantitative analysis of large amounts of text to (a) compare the lexis of two corpora with each other and (b) identify recurrent strings of words on the basis of their frequencies. Neither can be identified intuitively: the amount of data is too large to detect the patterns without the help of software. Conversely, however, the large corpus allows us to analyze a sample of the register that is as representative as possible.

The larger the representative corpus, the more likely it is that it features constituent linguistic patterns of the register with statistically significant frequency. It is these constituent patterns that students of the register need to learn, since only by knowing and actively using these are students able to produce discourse that conforms to the expectations of the register's discourse community.

The key word analysis of the WCBE when compared with the BNC identified more than 1,500 key words. This indicates large lexical differences between the two corpora and therefore between business and general English. For practical reasons, I will look at the 500 statistically most significant key words of the list.

Of these 500 key words, 305 are business-specific and 195 are general English words. The business-specific words are mostly terminology, frequently nouns, which identify business concepts, for example *investment*, *securities*, *shares*, and *commission*. Verbs include *paid*, *investing*, *purchased*, and *issued*. Some business-specific words, such as *paid*, refer to a business transaction, but have entered general English because of their very frequent usage in and reference to everyday transactions.

The findings on (a) the high number of key words identified in this analysis and (b) the high number of nouns on the list allow us to draw two conclusions that are relevant for the design of teaching materials:

1. Terminology is a characteristic feature of the register and includes terms such as *portfolio* and *stock*.
2. The register in its written form, as represented by the corpus, is mainly characterized by nouns as opposed to verbs. This reflects the tendency toward a nominal style in written general English.

Both findings mirror the contents of current textbooks.

As a second step in the analysis, the most frequent continuous and discontinuous phrases of between three and six words in the WCBE are extracted. For reasons of space and relevance, the following analysis is restricted to the top 50 n-grams and p-frames of each length. In teaching materials, however, the numbers of phrases taught could be much larger.

Table 1 lists the numbers of general English and business-specific phrases that occur among the top 50 phrases of the respective lengths. There are only 10 6-frames in the corpus that occur with a minimum frequency of 200, the threshold level used in this

Table 1 General English and business-specific phrases among the top 50

	<i>General English</i>	<i>Business-specific</i>
3-grams	25	25
3-frames	37	13
4-grams	16	34
4-frames	19	31
5-grams	8	42
5-frames	5	45
6-grams	5	45
6-frames	1	9

analysis. Examples for both types of phrases are *a * of the*, a general English 4-frame, and *the market value of the*, a business-specific 5-gram. Like the key words, business-specific phrases were identified in a two-part process by (a) an intuitive classification and (b) an analysis of the phrases' concordance lines.

The numbers above and the items on the lists suggest three main patterns relevant for teaching:

1. The longer the phrases are, the more business-specific they are. This confirms findings from other phraseological analyses (e.g., Starcke, 2008) which have shown that shorter phrases are open to more lexical combinations than longer ones. Because of the greater number of lexical and grammatical items included in the phrases, longer phrases are more restricted in their lexical and grammatical environments than shorter ones.
2. Many of the phrases that are categorized as business-specific are extensions of shorter phrases classified as general English. This is the case, for example, with *class a ** which becomes ** class a shares*. Changing the length of a phrase might also change its classification of being or not being characteristic of a particular register, possibly based on the occurrence of lexis that might have a different meaning in another register, for example *share*.
3. Business terminology, for instance *securities* and *asset*, is a determining factor for classifying a phrase as business-specific, for example *by investing primarily in*, which is rendered business-specific by the occurrence of the term *investing*. The classification of a phrase might therefore depend on the occurrence of specific lexis, possibly of one word only. This indicates that the lexis and phraseology of the register are interdependent. In fact, those words which render phrases business-specific are frequently identified as key words in the key word analysis presented above.

On a more general level, the phraseological analysis of the WCBE has identified three types of phrases. One type is what I call *terminological phrases*, that is, phrases which express a particular concept and have to be learned as one unit. An example is *the securities act*, which specifies a particular law. These phrases are complementary units of both lexis and content, in this case the regulations set out in *the securities act*. Language and content cannot be separated.

The second type is fixed phrases, n-grams, which are not business-specific, for example *in connection with*, which might characterize a formal written style.

The third type is both general and business English p-frames which are more compositional in nature in that they are flexible in one slot, for example *the * of the* and *net asset value **. In the WCBE, the most frequent realizations of the *** in the first phrase are *value*, *end*, *date*, *terms*, and *time*, and *at*, *the*, *and*, *fund's*, and *in* in the second phrase. They are combinations of both the phrase and the fillers of the variable slot which are, in fact, the phrase's collocates and paradigmatic variables. Being able to combine them allows learners of the register to produce idiomatic language.

All three types of phrases are characteristic features of the register, and it is the co-occurrence of the characteristic phrases and lexis in the discourse which transforms general English into business English and also allows the two to co-occur. Reflecting this is a main concern of business English textbooks.

Taking the lemma SHARE*, that is, the node word *share* with every possible realization of the *** such as *shared* and *sharing*, as one example for a practical application of these findings, Table 2 shows its numbers of occurrences as part of the n-grams and p-frames and its co-occurrences with the node word *class*. Both lexical items are also identified as key words in the corpus.

Table 2 Occurrences of SHARE*

<i>n/p</i>	<i>Number of n-grams which include SHARE*</i>	<i>Number of p-frames which include SHARE*</i>	<i>Number of n-grams which include SHARE* and class</i>	<i>Number of p-frames which include SHARE* and class</i>
3	6	4	4	1
4	12	16	11	14
5	10	16	9	14
6	9	3	8	3

The high number of occurrences of SHARE* as part of the corpus's most frequent phrases and the high number of co-occurrences of SHARE* and *class* indicate (a) the importance of the vocabulary of shares and the share market in general within the register, and (b) that shares are frequently defined and identified, for example by mentioning their class. This defining of shares often follows two grammatical patterns. First, in 61 of its 76 occurrences, SHARE* stands to the right of a determining or defining word or phrase, for example *the class * share* and *the net asset value per share*. Second, SHARE* is used in passive constructions in seven instances, for example *shares are subject to ** and *if shares are redeemed*, and in a further four instances SHARE* is the object of an action, for example *purchase of class a shares*. Active voice constructions or phrases in which SHARE* functions as agent, for example a description of a share's performance, do not occur among the corpus's most frequent phrases and therefore seem to be less frequent in language usage than passive constructions. These grammatical patterns could be reflected in teaching materials.

The pragmatics of business English, for example politeness and conventions for small talk in a business context, are more difficult to identify in a frequency-based corpus analysis than the features discussed above. Nevertheless, the occurrence of the modal verbs *may* and *shall* in the list of key words might indicate the salience of politeness and therefore of pragmatics in the genre.

An analysis of their concordance lines, however, shows that *shall* mainly occurs in legal contexts such as specifying requirements, rights, and obligations. Its most frequent collocates at L1 (immediate left) are *fund, and, committee, board, and plan* and at R1 (immediate right) are *be, not, have, include, and become*. This stresses the importance of legal English, which is not featured in many business English textbooks, for business English.

May, on the other hand, is mainly used as a marker of politeness with *fund, you, which, and, and it* as its most frequent L1s and *be, also, not, invest, and have* as its most frequent R1s. This is a possible starting point for the discussion of the linguistic means and the significance of politeness in business discourse and therefore for teaching pragmatic conventions in business English.

Using frequency criteria based on a corpus linguistic analysis for the selection of units of teaching in business English classes may suggest a shift in focus of currently used teaching materials. The corpus linguistic evidence suggests that the strong emphasis on lexis in teaching materials might be shifted to include both lexis and phraseology as well as a stronger focus on the pragmatics of politeness in business English and the salience of legal English. This includes lexis and phraseology which are both business-specific, that is, business terminology and terminological phrases, and general English. Only by teaching and, from the students' perspective, learning these various aspects of the genre can the learners become competent members of the discourse community of business English.

Corpus Analysis of Child Language

HEIKE BEHRENS

Corpus research has a long-standing tradition in child language research: Observational data provide the basis for our knowledge about developmental processes including their individual and crosslinguistic differences (for more detail, see Behrens, 2008). But the analyses critically depend on an appropriate corpus design that provides sufficient information on and appropriate transcription and annotation of the linguistic structures at stake. In the following, I will discuss the implications for analysis that result from corpus design, and outline the main research questions addressed by corpus analyses of child language. I will conclude with a sketch of the research perspectives made possible by new achievements in corpus linguistic methodology.

Corpus Design

The design for collecting naturalistic, spontaneous speech corpora proceeds along five dimensions: participant selection, the mode of recording, the types of interaction to be recorded, the sampling regime, and the length of the recording period.

Participant Selection and Recording Choices

The most traditional forms of language acquisition corpora derive from longitudinal case studies, often of the researchers' own child or children. Recording one's own children not only allows easy access and a naturalistic setting, but also facilitates the interpretation of the children's utterances because one is familiar with their pronunciation and way of talking, their past experiences, and the current setting. However, this type of subject selection led to a bias in the socioeconomic background as this procedure self-selects middle-class and highly educated families. The Harvard project initiated by Roger Brown was among the first to include children from different socioeconomic backgrounds (Brown, 1973).

The earliest corpora on language development were parental diaries. Diary notes can be taken everywhere. The only imperative is that the notes be taken on the spot, as people's long-term verbal memory tends to be poor. To date, audio or video recordings seem to be the most natural choice since they capture the signal authentically. But recording technology imposes some constraints on the situations that can be recorded. To improve comprehension and to make transcription easier, it is preferable that only few people take part in the activities, that the interaction take place in a quiet environment, and that play activities which involve a lot of noise be avoided. Also, the presence of recording technology may make the situation less natural. Recordings in other family homes typically involve the participation of researchers who take care of the recording, especially when video recordings are made to follow the face-to-face interaction of the children as well as their focus of attention in a particular situation. These researchers can assume the role of "wallpaper" by not participating in the interaction and taking notes about the situation instead (e.g., Hart & Risley, 1995), or they can actively engage with the children and their families and assume the role of a family friend. In order to avoid the involvement of extra-family

members in the recording situation, the families could be equipped with mobile equipment such that they can carry out the recordings themselves.

Regarding the situations to be recorded, most longitudinal studies in first language acquisition try to capture the naturalistic interaction between the children and their social environment and thus focus on play situations and mealtime conversation. But the research design can be also be comprehensive and geared to sampling a more representative array of interactional situations in order to achieve a complete picture of the child's linguistic and conversational abilities (Roy, 2009). Such a comprehensive picture requires a large number of recordings and faces the transcription and coding bottleneck.

Sampling Regime and Corpus Size

With the rise of corpus linguistic methods and analyses, there is growing awareness of the interdependence of corpus size and the chance of finding the structures under investigation. When the sampling density is too low, rare structures may be missed completely in a particular sequence, or only individual exemplars may be sampled that are hard to interpret developmentally. Studies from the 1950s to the 1990s typically recorded the children every two or four weeks for 30 minutes or an hour. While the amount of data obtained in this way allows us to trace the main aspects of development, the data generally do not suffice to study the development of complex and low-frequency phenomena, and they typically do not suffice to assess the productivity even of common structures. In a new type of dense databases one or two hours per day are recorded for longer time intervals (Lieven, Behrens, Speares, & Tomasello, 2003; Behrens, 2006). These dense databases reveal fine-grained developmental processes as well as variability of language use in children and adults. With limited transcription capacity, dense recording cycles with long breaks (e.g., one or two weeks of dense recording every two months) may provide a better picture of the child's level of achievement than single recordings every couple of weeks. The most complete record of language development is Deb Roy's full-time observation of his son. The amount of data gathered from several fish-eye cameras can only be transcribed and analyzed with the help of specifically developed tools for automatic data recognition (Roy, 2009).

The relationship between sample size and research question has implications for the corpus size needed: Studies of phonetics usually require smaller corpora, whereas large samples are essential for the study of rare and complex constructions (Demuth, 2008). Statistical estimates help to assess the amount of data necessary in order to find a sufficient number of examples in a corpus (Tomasello & Stahl, 2004; Rowland, Fletcher, & Freudenthal, 2008). To increase the frequency of the construction at stake, targeted sampling methods, for example diary notes or settings with stimulus material, can provide a reasonable amount of data for a limited domain within a reasonable amount of time. In targeted designs certain tasks (e.g., picture-book descriptions) are repeated, or props and activities are used to elicit certain structures such as spatial language or passives. Stimulus material also helps to confront the children with linguistically challenging situations and to compare their performance in new versus routine situations (Eisenbeiss, 2009). With appropriate instruction children's caregivers can be trained to collect targeted data such that larger populations can be studied.

Longitudinal and Cross-Sectional Designs

Most corpora of child language follow a longitudinal design and trace children's development over a period of one or more years. Existing longitudinal corpora tend to focus on the age range of 1.5 to 3.5 years because of the current research interest in the earliest

stages of development and because of the belief that most of language development is achieved in the preschool period. Consequently we have only a very limited understanding of children's spontaneous language use between early childhood and school age. Furthermore, there are methodological problems in comparing data obtained at home and in school since the early child language data typically stem from free play situations and everyday interactions at home, whereas the corpus data of older children tend to come from targeted elicitation contexts such as narratives, picture-book descriptions, and experiments.

Longitudinal studies tend to be restricted to a few children only because of the transcription bottleneck and because the families involved need to be committed to the study in order to maintain a recording scheme over several years. Moreover, long-term developmental processes can only be analyzed after the study has been completed.

Cross-sectional designs can be used to study several children of different age-groups at the same time. Most cross-sectional studies follow a targeted design: Picture-book descriptions provide information on children's narrative competence at different ages and across different languages (e.g., Berman & Slobin, 1994), and elicitation tasks can be used to gather data longitudinally as well as cross-sectionally (Rowland & Theakston, 2009; Theakston & Rowland, 2009). The developmental state of specific groups or children can also be correlated with other measures (IQ test, language development score, vocabulary size), and can be used to investigate the variability within a particular population.

Transcription and Data Storage

Transcribing naturalistic, spontaneous interaction requires decisions on the accuracy of transcription (standard orthography or phonetic and prosodic accuracy), the delineation of units (clauses, sentences, or utterances), and the inclusion or exclusion of context information. These decisions have trade-offs for analysis as transcripts with standardized orthography can be coded and analyzed more easily than a transcription that represents articulatory variation faithfully. Misrepresentation of the data through standardization can be avoided by marking deviations from the standard with special markers and by linking the transcription to the original sound or video signal such that it is possible to go back to the original signal, or by transcribing the data at several layers (e.g., phonetic and orthographic transcription). The Child Language Data Exchange System (CHILDES: <http://childes.psy.cmu.edu/>) developed and maintained by MacWhinney in interaction with the child language research community provides transcription guidelines for child language data (CHAT: Codes for Human Analysis of Transcripts) as well as the program package CLAN (Child Language ANalysis) specifically designed for the analysis of CHAT-transcripts. CLAN offers programs for frequency statistics, searches, collocation analyses, and much more (see MacWhinney, 2008b). CHILDES also hosts the publicly available archive for child language acquisition data, currently comprising 44 million words from 28 languages (MacWhinney, 2008b), and makes them accessible by indexing each file with metadata (e.g., codes for the language[s] spoken, the speakers, their socioeconomic background) according to the Talkbank protocol (www.talkbank.org). Fast-moving developments in information technology require continuous maintenance of digitized data, not only to exploit the latest technological developments, but also to prevent data from being lost on obsolete platforms or outdated and inconvertible database programs. Since the 1980s, the CHILDES system has been adapted to the latest technological developments and is now available in a platform-independent UNICODE format. Currently, a standardized and automatic morphosyntactic annotation system is being developed (MacWhinney, 2008b).

Analyses

Developmental Trajectories

The most obvious focus of corpus-based first language acquisition research is to establish developmental trajectories regarding structural phenomena (phonetics, morphology, syntax, and the lexicon). In the earlier phases of corpus research, studies focused on the age and order of acquisition. Ideally, trajectories of different children are compared to establish, for example, the rank order of the emergence of morphology (Brown, 1973).

Semantic and pragmatic development is hard to access through corpora because, even if children produce a word correctly and appropriately, we do not know whether they have understood the full meaning of the word in the adult sense, especially since context information tends to be scarce in most published corpora. Semantic overgeneralizations are rare and better assessed through the diary method (Clark, 1993).

Despite almost 50 years of tape- and video-recorded corpus collection, only a limited number of languages have been studied, and for most of these languages we only have records of few children, studied for a short period. Thus, our knowledge regarding individual variation in child language is very limited, especially since the research focus was on establishing general patterns of development. Another limit is the age range sampled: Most corpora focus on the period between the ages of 1.5 and 3.5, and there are only few longitudinal datasets that cover the onset of schooling (e.g., the German Rigol Corpus on CHILDES). Because of the transcription bottleneck it is not expected that we will gather sufficient naturalistic data to allow for the study of individual differences. Here, training studies, standardized questionnaires, elicitation data, or experimental data will be more efficient methods of assessing individual differences and variation in learning strategies.

One of the major aims as well as one of the major problems in research on language learning is the assessment of productivity, defined as the capacity of the child not just to reproduce a linguistic structure, but also to have at least an initial understanding of its structural properties and its function. The mere occurrence of a structure does not attest its mastery. There are numerous criteria for productivity, ranging from variability in form (e.g., an item should be used in at least two or three different contexts), to quantitative criteria assessing almost adult-like mastery (90% correct usage in obligatory contexts; Brown, 1973), to an assessment of adult-like creativity including (experimental) evidence that the child is able to apply the structure to previously unknown lexical material such as nonce words (Tomasello, 2000). The question of what counts as acquired is also theory dependent. Usage-based theories of acquisition assume that children build up linguistic knowledge gradually. Consequently, productivity develops from unproductive reproductions to a more and more flexible usage (Tomasello, 2000). Nativist approaches to acquisition assume that children are innately endowed with conceptual and/or structural knowledge and that this knowledge is accessible to children. In this view, innate knowledge provides both pathways and constraints for acquisition that account for inter-individual commonalities and low error rates (Goodluck, 2009). Because of these different theoretical vantage points in child language studies, the evidence and its interpretation does not lead to a coherent picture of language acquisition across the theoretical divides (see Ambridge & Lieven, 2011, for a comparison of the different empirical predictions).

Interaction of Linguistic Variables

Crosslinguistic comparisons help to distinguish language-general, possibly universal, learning processes from language-particular ones (see the seminal project initiated by Slobin that compared data from more than 20 typologically diverse languages with respect to a wide range of linguistic domains and their developmental trajectories; Slobin, 1985–97).

Crosslinguistic differences in form–function relationships and corresponding differences in the order of acquisition help us to identify what makes a language hard or easy to learn. Bates and MacWhinney developed the competition model in order to assess the reliability of a linguistic cue (Bates & MacWhinney, 1982; see MacWhinney, 2008a, for its development into a processing model for L1 and L2 acquisition). Cue reliability is a function of cue availability (the frequency with which it occurs) and cue validity (the uniqueness with which it encodes a particular function). If a cue is frequent and unique, it is easier to learn than when it is rare and multifunctional. The competition model can be applied to complex linguistic structures where many cues interact. Cues such as word order, morphology, and the animacy of the noun-phrase referent contribute to sentence processing. If these cues are assessed language by language it is possible to show how they compete in order to predict developmental trajectories crosslinguistically (Kempe & MacWhinney, 1998).

In the study of the interaction of variables, traditional corpus research is inspired and supplemented by connectionist modeling and computational linguistics. Connectionist models simulate neural networks to study learning processes. Initially, these processes were modeled with hypothetical data, but more recently input data from child language corpora have been used (Westermann, Ruh, & Plunkett, 2009). Connectionism is related to dynamic systems theory: Both view linguistic categories as emergent, but may differ in their view on the internal mental representations of grammar. Dynamic systems theory also views linguistic structure as embodied and includes non-linguistic variables as well (Hockema & Smith, 2009). Computational models of language acquisition focus on the acquisition of phonology and syntax, especially in the probabilistic basis for category formation. Such models differ in the linguistic structures they assume. Some models work bottom-up and derive structure probabilistically from co-occurrence relations (Redington, Chater, & Finch, 1998); others start out with assumptions about the underlying tree-structure of language (Bod, 2009).

The Role of the Input

What kind of information is available to language learners and how do they make use of it? In nativist frameworks, input was long disregarded as a major force for language development, but in functionalist, constructivist, and usage-based approaches to language acquisition, linguistic structure is supposedly derived from the child's interaction. If language acquisition is input driven, there should be a close resemblance between child language and the data the particular child is exposed to (Behrens, 2006). This does not imply that children do not generalize beyond what they hear, but it is hypothesized that generalization is gradual and based on abstraction over positive data. Critically, child language does not emerge as a mirror image of the adult language: Perceptual factors (e.g., prosodic prominence, perceptual salience) and functional factors (e.g., communicative usefulness, semantics) influence what children learn first (Clark, 2009). To date we have only very limited knowledge of the linguistic evidence available in the input (e.g., Cameron-Faulkner, Lieven, & Tomasello, 2003). But with the new fully parsed databases a more comprehensive picture of the adult language and the way in which children make use of this information is within reach.

Perspectives and Desiderata

New perspectives for corpus research on L1 acquisitions not only include the study of more and typologically diverse languages and the study of later L1 development, but also a better use of the existing data for research synthesis and validation across corpora and the inclusion of non linguistic information provided by the discourse context.

Language acquisition research follows the general trend in social sciences from qualitative to quantitative studies. Studies based on corpora can provide basic insights that can help formulate subsequent experimental studies. But most individual corpora are too small to allow valid generalizations. Despite the availability of a range of corpora in the CHILDES database, most corpus studies do not make use of the full range of corpora that are relevant to a particular question. However, with the new tools for morphosyntactic analyses, comparative studies across parsed corpora will become easier and more efficient. But standardization also leads to information reduction as a particular level of transcription and a particular level of coding is chosen. Hence researchers need to familiarize themselves very carefully with what information is and is not available in the database to avoid unwarranted conclusions from comparative quantitative analyses.

The use of the full quality of the signal is also important. The majority of corpus studies focus on the linguistic information alone. But communication is embedded in a real-life context with the presence of discourse partners and their linguistic and non linguistic behavior. The discourse context can influence what needs to be encoded or not, or how a particular utterance should be interpreted. Researchers studying the acquisition of argument structure have developed methods to check whether and how this additional information affects the sentence structure of children and adults (see Allen, Skarabela, & Hughes, 2008). In early child language, for example, objects that are physically present and perhaps even jointly attended are often omitted in speech. In most publicly available corpora, context annotation is too scarce for such analyses, and access to the original video recording is necessary to study factors like gaze direction and joint attention.

Another domain for innovative L1 corpus research lies in diagnostics. As stated above, establishing the order of acquisition and the normal course of acquisition of a particular language is one of the major aims of corpus linguistic child language studies. But for several reasons the evidence we have is scattered: partially because of the limited size of the database for many of the languages studied, partially because of the lack of meta-analyses for those languages for which larger databases are available, and partially because of the lack of research syntheses that summarize the results from the studies available. Consequently there is a gap between the results from base research on first language development studies and the data needed for purposes such as speech therapy and early intervention. Hart and Risley (1995) conducted an observational study of 44 US children's early language development, and were able to follow the achievement of most of these children at school age. It turned out that the best predictor of these children's success at school was the amount of input they received in early childhood. The amount of input was correlated with conversational style, as encouraging input tends to be richer in vocabulary and syntactic structures than an interactive style that mainly consists of prohibitions.

In summary, we expect to see methodological advances with respect to quantitative analyses. With the availability of more data that are transcribed and coded according to the same standards, it will be possible to study the acquisition of rare structures more closely, and to conduct statistical tests that help us to overcome the problem of the interpretation of small datasets. But we also expect advances in qualitative studies: With the increased interest in the situational and communicative grounding of language and language acquisition, analyses of the non linguistic and linguistic information captured on video together will provide a better picture of how interaction shapes the course of language acquisition.

Corpus Analysis of English as a Lingua Franca

BARBARA SEIDLHOFER

The acknowledged advantage of corpus linguistics is that it provides access to data derived from actually attested language upon which a reliable description can be based. This enables linguists to make use of observation rather than being dependent on less reliable data, based on either introspection or elicitation. A prior decision that has to be taken, however, is what kind of attested language is to be selected.

As far as English is concerned, the important corpora have been predominantly those capturing English as a native language (ENL), reflecting the usage of so-called educated and predominantly British and American native speakers of the language. Corpora have also been compiled of an array of varieties of English mostly in postcolonial settings where English is an official additional language, and this has supported descriptive work especially in the field of World Englishes. The scope of these corpora is primarily defined by reference to particular speech communities residing in certain countries or regions. The assumption here is that the usage of the speakers belonging to these speech communities represents different varieties of the language—British English, East African English, and so on (see, e.g., Kortmann & Schneider, 2008).

What has so far received very little attention from corpus linguistics is the essentially extraterritorial use of English as a lingua franca (ELF) for international or intercultural communication. Defined as the common means of communication chosen by speakers from different linguacultural backgrounds, ELF does not fit the essentially geographical concept of “varieties” tied to speech communities mentioned above. ELF is used among people that may be native or non-native speakers of English, but the ethnographic and sociolinguistic reality today is that the vast majority of ELF users have first languages other than English. This means that countless interactions worldwide take place every day in which only a very small minority of native speakers of English, if any, participate.

This global use of the language is noteworthy not only because of its extent, but also because of its sociolinguistic significance, representing as it does the very dynamics of the process of language variation. And yet it has remained virtually undescribed. At a time when the electronic means for such description are readily available, it is a curious anomaly that the very technological development that is both cause and consequence of the global spread of English has not been applied to investigating ELF. Instead of being seen as exemplifying natural and necessary linguistic vitality, and an obvious object of the kind of observation that corpus linguistics can uniquely provide, ELF has generally been subjected to impressionistic judgment and often dismissed as deviant, especially in English-language teaching circles.

But the late 1990s saw the beginning of a lively and controversial debate about the recognition of ELF as a phenomenon that was worth studying in its own right and called for a rethinking of established sociolinguistic ideas. Alongside arguments for the conceptualization of ELF as a natural, variable use of the language (e.g., Seidlhofer, 2001; Widdowson, 2003), a number of small-scale empirical studies were published. Jenkins (2000) was a particularly significant publication: The book’s focus is on phonology, but the empirically

based discussion of issues of international intelligibility, of relevant sociolinguistic and sociopsychological research, and its delineation of applied linguistic implications for teaching, fueled demand for a broader empirical basis for the description of ELF interactions.

Around the beginning of the millennium the case for corpus-based descriptions of ELF to remedy its neglect was sufficiently recognized to attract funding and, since then, empirical research on ELF usage has been gathering momentum. In addition to a growing number of published and unpublished PhD theses on various aspects of ELF based on “personal” corpora that are not in the public domain, there are now two corpora explicitly designed for the investigation of ELF usage: VOICE, the Vienna–Oxford International Corpus of English (VOICE, 2009; <http://www.univie.ac.at/voice/>), and ELFA, the Helsinki-based corpus of English as a Lingua Franca in Academic Settings (see Mauranen & Ranta, 2008; <http://www.uta.fi/laitokset/kielet/engf/research/elfa/corpus.htm>).

VOICE and ELFA each comprise about 1 million words of transcriptions of recordings of spoken interactions among speakers of many different first languages carried out through ELF. For researchers interested in language variation and language change—obviously a key concern of the study of ELF—a focus on the spoken medium is essential, as it is in speech that variability in language is most readily discernible. Since the primary interest of ELF research is to further the understanding of how the language develops when used for intercultural communication, predominantly by non-native speakers across the boundaries of primary speech communities, it stands to reason that the first ELF corpora should be focused on capturing how ELF is spoken rather than written. Observing how interactants negotiate meaning in real time, in spontaneous, non scripted speech events, removes the standardizing pressure of writing. In addition, when the speech events are highly interactive, researchers can also gain some measure of insight into how mutual understanding among the interlocutors is co-constructed.

The speech events captured in both corpora are naturally occurring; this means that the interactions they record were not specially arranged, nor were they elicited, but they would have happened anyway, whether the researchers were there to record them or not. There are no speech events with speakers who all share a first language, nor are there English-language lessons. Both corpora contain transcriptions of complete speech events rather than samples or extracts of longer texts. In the case of VOICE at least, this decision was taken in order to also allow for qualitative analyses of the corpus texts, in the sense that corpus users would not be limited to sampling the corpus in an essentially context-deprived fashion, homing in on individual words and word clusters with the help of the usual corpus tools. Instead, it should be possible to access and make sense of entire speech events, as a frame for what the participants experience, as an analytic construct for the researcher, and as a complete and meaningful unit for the corpus user. This decision, of course, meant that the corpus contains transcripts of interactions of varying length, ranging from a few minutes up to several hours.

The two corpora differ most significantly in their domain coverage. ELFA focuses on the academic use of ELF, whereas VOICE covers three domains: educational, leisure, and professional (the latter subdivided into business, organizational, and research/science). This difference of coverage provides for the possibility of undertaking small-scale comparisons of findings to investigate whether certain patterns are likely to be domain-specific or specific to ELF usage more generally. In terms of first languages represented, both cover a wide range, but VOICE has a primary (but not exclusive) European focus. However, the work of VOICE has been extended in that it has provided the methodological basis for another, complementary ELF corpus in the “ASEAN + 3” region (Association of Southeast Asian Nations plus Japan, South Korea, and China), being prepared by a project consortium with its center in Hong Kong (see Kirkpatrick, 2010; <http://www.ied.edu.hk/rcleams/view.php?secid=227>).

Another significant difference between ELFA and VOICE (at the time of writing in 2010) is that while ELFA, according to the project Web site, “will be available to researchers on request,” presumably on-site, VOICE is in the public domain: VOICE Online 1.0 was released for free Internet access in 2009, with the release of the XML corpus to follow, together with a handbook. This open-access policy, which VOICE follows as a matter of principle, is especially important for applied linguistics in that it enables researchers to draw on the resources of the corpus as appropriate to their particular inquiries and to check on findings that other researchers have derived from the data.

The compilation of VOICE has posed an array of interesting methodological challenges right from the start, comparable in some ways to the recording of an unknown language. On the one hand, the purpose of VOICE is to provide a basis for analyzing ELF and, since this is a use of English that has hitherto not been described, let alone codified, it would have been counterproductive to rely on taken-for-granted assumptions based on encoded varieties of English. On the other hand, if spoken ELF was to be converted into consistent, computer-readable transcripts, these had to be modeled on some existing orthographic system. But if neither British nor American spelling is actually suggested by the speakers’ pronunciation, which one should be used when transcribing their speech? The decision was therefore taken to adopt neither entirely British nor entirely American spelling, but to introduce a (clearly defined) degree of fusion of the two. The intention behind this was to give the ELF speakers in the corpus their own voice, so to speak, to achieve a certain symbolic degree of dissociation from either British or American English, and to reflect the intrinsic hybridity of ELF talk—while still retaining the consistency that computer-readability and retrievability requires.

As for markup, particular tags absent or optional in other transcription conventions are employed frequently in VOICE because observation of the ELF interactions suggested that certain features have a high functional load. For instance, utterances spoken laughingly are put between “<@> </@>” tags, and special tags are used for speaking onomatopoeically, for marking non-English speech, and for pronunciation variations and coinages: “yes and also <pvc> *financiated* [financed] </pvc>” (VOICE, 2009, POWgd325).

A precise description of all markup and spelling conventions is available on the project Web site, and the rationale of the decisions taken is described in detail in Breiteneder, Pitzl, Majewski, and Klimpfinger (2006). The operationalization of these conventions posed a challenge since transcribers had to be trained to override their natural inclination to report what they supposed was said from an ENL viewpoint instead of recording what was actually said.

While many problems were operationally resolved, the whole undertaking of compiling an ELF corpus has been accompanied by a keen sense of the tension between the great potential of a corpus for getting at textual facts on the one hand and its considerable limitations when dealing with language use “in the real world” on the other. This is why, from the very beginning of work on ELF description, it was regarded as crucial that the design of VOICE should strive to counteract some of the inevitable drawbacks of a corpus (and a relatively small one at that) by laying particular emphasis on factors that support corpus users in their attempts to develop an emic understanding of the speech events in the corpus, what the purpose of the interaction is, what the relationships are between the speakers—in short, “to figure out what the devil they think they are up to” (Geertz, 1983, p. 58). The design features that support this approach are complete speech events; abundant contextual information; and a very high degree of interactivity rather than monologues, which would provide no clues as to how participants negotiate meaning and jointly construct their shared communicative resource. In addition, a number of sound files of the original recordings will be made available and the possibility of providing part-of-speech

tagging is being investigated. But obviously, severe limitations remain as to what can be captured in such a corpus.

The descriptive work on ELF has not mainly been on linguistic forms as such, but on the communication processes the forms point us to, on trying to get at what these forms are symptomatic of—how ELF users exploit and shape the underlying resources of the language to achieve their communicative outcomes (for examples see references in Seidlhofer, 2009). Over recent years, corpus-based studies of ELF talk have become available, and many of these are listed on the VOICE and ELFA Web sites. ELFA's sister project SELF (Studying in English as a Lingua Franca; <http://www.eng.helsinki.fi/elfa/self>) investigates how speakers experience and negotiate ELF in their academic activities. The first comprehensive collection of ELF studies based on various sets of data but also on the two ELF corpora discussed here is Mauranen and Ranta (2009). These descriptive findings raise important issues about what "English" is and how it can be described, and they demonstrate that ELF usage cannot be dismissed as defective or deficient English. On the contrary, corpus findings reveal how its users appropriate and exploit linguistic resources in complex and creative ways to achieve their communicative purposes.

While some of the forms studied in learner corpora (see, e.g., Granger, 2003) will be the same, the interpretation of these forms is very different: They point us to the processes by which interlocutors from diverse first languages appropriate and adapt English for their own needs. The variety of linguacultural backgrounds that come into contact through ELF talk make for a high degree of fluidity and hybridity of forms, but certain regularities, particularly in the strategic uses of ELF, are beginning to emerge from various descriptive studies. They reveal how speakers draw on the underlying resources of the language, not just the conventional ENL encodings, and adjust and calibrate their own language use for their interlocutors' benefit. These insights in turn have shed new light on established concepts of "community" and "variety" and provide pointers as to how these may have to be reappraised when confronted with the unprecedented global phenomenon of ELF.

The applied-linguistic implications of corpus-based descriptions of ELF are potentially vast, since, if we want to understand how intercultural communication in a globalized world works, how it may be improved, and how it can be made amenable to teaching, we need to understand how ELF is used. For instance, an enhanced understanding of ELF interactions is a prerequisite for coping with typical ELF situations in peacekeeping operations, conflict resolution, and asylum-seeker interviews. Another application is the possibility of developing speech-recognition systems for non-native English speech, and of course the design of ELF teaching and testing materials. To mention another example, in linguistically diverse contexts such as the institutions of the European Union, where simultaneous interpretation is used on a large scale, English is increasingly used as a relay language. This English, however, is not ENL but ELF, and there is now a heated debate in the profession about how the training of interpreters and translators can take this fact into account.

ELF corpora also bring to critical attention another issue in applied linguistics, namely the relationship between linguistic description and pedagogic prescription. It has been proposed that the patterns of so-called real or authentic native-speaker usage that a corpus can reveal should be prescribed as the content of courses in English as a foreign or other language (see Wichmann, Fligelstone, & Knowles, 1997; Aijmer, 2009). The assumption here is that conformity to ENL norms of usage is necessarily the one and only valid objective for foreign learners of the language. The widespread use of ELF calls this assumption into question: What ELF corpora show is that international users of English are capable of communicating effectively without such conformity and it seems reasonable to suggest that this capability should be a major consideration when deciding on pedagogic priorities in the design of courses of English as a global international rather than a local national language.

Corpus Analysis of English as a World Language

ANDREA SAND

Introduction

Academic interest in the field now referred to as “English as a world language” arose out of the realization that there is more to the English language than British English and that the English language had in fact changed radically by becoming a language spoken around the globe. The linguistic study of English as a world language emerged in the late 1960s and early 1970s, as the bibliography compiled by Viereck, Schneider, and Görlach (1984) documents in great detail. Initially, the main focus of research was on native speaker (L1) varieties, such as American English, Canadian English, Australian English, or New Zealand English, but in the late 1990s and early 2000s, a wealth of studies has been published on postcolonial second language (L2) varieties, also called New Englishes or indigenized Englishes. These varieties of English are mostly used as an official language in former British colonies and thus in a number of public domains, such as administration, education, or the media. They are generally spoken only as a second language by the majority of the population. Today, the terms “English as a world language” and “World Englishes” tend to be used mainly in reference to the latter group, which includes varieties such as Indian English, Singapore English, Nigerian English, Kenyan English, and Jamaican English. As corpora of English as a foreign language (EFL), English as a lingua franca (ELF), and learner language are discussed elsewhere in this encyclopedia they will not be covered in this article, although they might also be considered part of “English as a world language.”

At about the same time, the field of English corpus linguistics was also developing, with the compilation of the first computer-readable 1-million-word corpora, the Brown Corpus of Written American English (Brown) in 1963–4 and the Lancaster–Oslo–Bergen Corpus of Written British English (LOB) in the late 1970s. Both Brown and LOB cover 500 texts of 2,000 words, all published in 1961. The same number of samples was taken from a variety of genres, including news reportage, science, religion, government documents, and fiction. The availability of these two closely matched sets of data triggered a flurry of systematic cross-variety comparisons which also lead to the publication of corpus-based dictionaries and grammars, while the studies describing the features and sociolinguistic status of World Englishes in the 1970s and 1980s relied on more traditional data collection methods, generally favoring a rather impressionistic “feature-list approach,” that is listing phonological, morphosyntactic, lexical, or stylistic features believed to be particular to or characteristic of a given variety. In most studies, no information was provided on the frequency of a given feature or any indication of whether it is restricted to speech or writing.

Pioneering Corpora

The breakthrough for a corpus-based approach to studying World Englishes was the compilation of the Kolhapur Corpus of Indian English at Shivaji University, Kolhapur, between 1980 and 1986. The Kolhapur Corpus is designed to match LOB and Brown as

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

DOI: 10.1002/9781405198431.wbeal0244

closely as possible, while at the same time reflecting the realities of English in India. It consists of texts published in 1978 and its structure closely resembles that of LOB and Brown, but some of the text categories have been weighted differently. There are, for example, fewer religious tracts and fewer institutional reports, but more government documents than in the two other corpora. The differences are greatest in the fiction section, where the subsections “Western fiction” and “detective fiction” had to be replaced by other text types, as they were not available in Indian English. Nevertheless, the corpus provided the first opportunity of systematically comparing Indian English to British or American English, and of allowing quantitative analyses (see Shastri, 1988).

In the following years, two further native-speaker varieties followed suit: In 1990, the Australian Corpus of Written English (ACE) was released at Macquarie University, Australia, compiled according to the Brown and LOB guidelines of texts published in 1986 (see Green & Peters, 1991). In 1998, two New Zealand English corpora became available. The Wellington Corpus of Written New Zealand English (WWC) also mirrored the format of the earlier corpora with material published between 1986 and 1990. Additionally, the Wellington Corpus of Spoken New Zealand English (WSC) consisting of 1 million words of spoken English, including monologues and dialogues in private and public settings recorded between 1988 and 1994, was compiled to provide researchers with spoken data as well (see Holmes, Vine, & Johnson, 1998). Some of the spoken data recorded for the WSC was later also used for the New Zealand component of the International Corpus of English, the most ambitious and most comprehensive project with regard to corpora of World Englishes.

The International Corpus of English (ICE)

In 1988, Greenbaum made a proposal for an international corpus of English, which was to include 1-million-word subcorpora from L1 and L2 varieties and cover written and spoken genres alike. In order to allow text-linguistic and pragmatic research as well as morphosyntactic and lexical research, the option of including full texts in addition to the 2,000-word samples in the form of a monitor corpus was envisaged. This meant that the subcorpora could be accompanied by a collection of full-length texts to allow access to the context of the samples. These changes with regard to the first generation of 1-million-word corpora were due to changes in the major research paradigms in linguistics, in which the role of context and of spoken discourse had become gradually more important over the years.

The design of the ICE corpora is weighted toward spoken language, with 300 spoken samples out of a total of 500 2,000-word samples. Of these 300 texts, one third is made up of natural face-to-face conversations. Also included are telephone conversations, class lessons, broadcast discussions, parliamentary debates, legal cross-examinations, and business transactions, as well as monologue text types, such as spontaneous commentaries, unscripted and scripted speeches, demonstrations, legal presentations, broadcast news, and broadcast talks. The written section consists of 200 text samples and includes non-printed material such as student essays and exams as well as social and business letters. The printed genres are very similar to those represented in Brown and LOB, covering press text types, academic and popular informational texts, administrative and instructional writing as well as fiction. The design of the corpora thus enables linguists to study variables in highly formal registers (e.g., scripted speeches, academic writing) as well as in very informal settings (e.g., conversation, personal letters; see Nelson, 1996a). Originally, a collection period between 1990 and 1994 was envisaged, but as new teams have been joining until very recently, the material will eventually cover a much larger time span (Greenbaum, 1996, p. 6; International Corpus of English, 2010).

The corpus will also ultimately be tagged and parsed for sophisticated syntactic analyses on the basis of the ICE-CUP retrieval software. At the time of writing, this is only available for the British subcorpus, ICE-GB, which was already completed in 1996. Some subcorpora, for example ICE-Ireland, also include special markup to allow searches for pragmatic markers and other discourse features. The subcorpora for Great Britain, Ireland (Northern Ireland and the Republic of Ireland), Canada, New Zealand, East Africa (Kenya and Tanzania), Jamaica, India, Hong Kong, Singapore, and the Philippines have been completed. At the time of writing, work is under way on subcorpora covering Malta, the USA, Australia, Fiji, Malaysia, Nigeria, Namibia, South Africa, Ghana, and Trinidad and Tobago (see International Corpus of English, 2010).

Eventually, the kind of research envisioned by Greenbaum at a time when only ICE-GB had been completed will become possible:

As the parallel corpora become available, new possibilities open up for rigorous comparative and contrastive studies. I envisage the search for typologies of national varieties of English: first-language versus second-language English, British-type versus American-type English, African versus Asian English, East African versus West African English. Researchers might explore what is common to English in all countries where it is used for internal communication, demonstrating how far it is legitimate to speak of a common core for English or of an international written standard. (Greenbaum, 1996, p. 10)

Some of the studies on the basis of several ICE subcorpora already indicate that there is a tendency to a high degree of uniformity in the more formal written text types while the spoken texts exhibit more variability, as for example shown in Sand's (2003) study on article use.

While the ICE project has enabled linguists to conduct comparative studies similar to those on the basis of Brown and LOB, there are also some methodological issues which should not be underestimated. As already pointed out with regard to the compilation of the Kolhapur Corpus, second-language varieties pose particular problems with regard to data collection. While adherence to the ICE compilation guidelines is crucial for optimal comparability, the sociolinguistic situation in some countries simply does not provide text types such as parliamentary debates or broadcast discussions in English. Therefore, some teams had to make allowances in this respect and substitute other text categories. For technical reasons the telephone conversations often had to be replaced by some other type of interaction, for example radio phone-ins. ICE-Hong Kong, for example, contains only 450 text samples, due to difficulty in data collection in some domains (Bolt & Bolton, 1996, pp. 201–8). Similarly, in bi- and multilingual situations English may not be the language of choice for conducting relaxed face-to-face conversations and the results are often much more formal than the texts in ICE-GB. ICE-East Africa deviates most from the compilation guidelines. The corpus contains a total of about 1.3 million words, but Kenya and Tanzania are unevenly represented and texts have been used in full rather than being cut at the 2,000-word limit (Schmied, 2003, pp. 251–2). Such changes may complicate comparative research across several ICE corpora.

Compilation teams working in multilingual settings also face the difficulty of providing a representative sample of informants, covering, for example, not just various age groups or both genders, but also all the L1s spoken in a particular country. There are also difficulties with regard to transcription conventions and normalization (see Biewer, Hundt, & Zipp, 2010; Mukherjee, Schilk, & Bernaisch, 2010). For ICE-GB, all deviations from Standard English with regard to grammar or spelling were normalized for optimal data retrieval (Nelson, 1996b, pp. 39–42). For most of the L2 varieties there is no codified standard norm, and every deviation from international standard usage bears the potential of showing in

which way the variety may develop in the future. Normalizing these instances would therefore threaten the research objective of representing actual language use, but retaining all variants may hamper retrievability. With new technological tools for accessing the sound files alongside the transcriptions, these decisions will eventually become more transparent for the researcher. Despite these methodological problems, the ICE corpora were the only available source of corpus data allowing cross-varietal comparisons in speech and writing when this article was written, while most other corpora were compiled with a variety-specific research goal in mind.

Other Corpora of World Englishes

It is impossible to list and describe all other available corpora of World Englishes in this survey, therefore only a small selection will be provided to illustrate the kind of work being done. De Klerk has compiled a corpus of spoken South African Xhosa English, consisting of roughly 500,000 words of various text types recorded from 317 speakers. She argues very strongly in favor of homogeneous corpora representing only speakers of one particular L1 rather than attempting to represent all L1s spoken in a multilingual country like South Africa, as would be required by the ICE compilation guidelines (see de Klerk, 2006). A different approach is taken by Meierkord, who has compiled the Corpus of Black and Coloured South African English in Contact. The corpus was compiled between 2004 and 2007 and consists of about 25 hours of speech recorded from 55 speakers of different ethnicities, professions, and L1s in group interview settings, which have been ethnographically transcribed. As the related research project focuses on lingua franca communication, the varieties of English used in interethnic discourse in South Africa were the target varieties in this corpus (see Meierkord, 2007). Both corpora will help researchers to gain a better understanding of spoken Black South African English, but they are hardly suited for comparative research because they represent completely different text types and informant groups.

While work on the West African subcorpora of ICE is still under way, the only available corpus resources for this region are the Cameroon English Corpus (CEC, ca. 890,000 words) compiled at the University of Yaounde in the 1990s and four corpora compiled at Humboldt University in Berlin, Germany, covering Cameroon (Corpus Calixthe, ca. 960,000 words), Nigeria (Corpus Nigeria, ca. 130,000 words), Liberia (Corpus Liberia, ca. 75,000 words), and Ghana (Corpus Ghana, ca. 135,000). All of these corpora consist of written material only, but cover a range of text types. While the CEC includes private and published written language, the other corpora also include data downloaded from the World Wide Web (e.g., e-mails) or from newsgroups (see Wolf, 2001, pp. 247–59).

Those interested in the English spoken in Singapore can also draw on the Grammar of Spoken Singapore English (GSSEC), which was compiled between 1998 and 1999. It consists of about 8 hours of conversation, totaling over 60,000 words, which were later included in ICE-Singapore, but is still available separately with a different kind of markup. As the recordings for the GSSEC were made under natural conditions and partly in settings rife with background noise, a second corpus was compiled at the National Institute of Education in Singapore by David Deterding and Low Ee Ling in 2001 to allow for acoustic phonetic analysis. It includes reading passages and interviews with speakers of educated Singaporean English (see Deterding & Ling, 2001).

Recent Approaches to World Englishes: Using the World Wide Web

When the British National Corpus (BNC) with about 100 million words of spoken and written British English was released in the 1990s, it was the first of the megacorpora used by dictionary publishers for lexicographic purposes to be made available to the academic public. Despite its shortcomings with regard to transcription and tagging accuracy, the sheer wealth of data made the BNC particularly suitable for research focusing on less frequent constructions or individual lexical items and their different meanings and functions in different contexts. At the time of writing, there is no similar project in sight to cover any of the L2 World Englishes discussed in this survey. Therefore, researchers have used different strategies of accessing databases larger than the ICE corpora. One of them is using the World Wide Web as a source of data.

The World Wide Web can be accessed directly through general search engines like Google, or search engines designed for linguistic research, such as WebCorp (see Renouf, Kehoe, & Banerjee, 2007). By searching only country-specific domains, it can be ensured that only texts from Web sites hosted in a particular country are used. While this database is vast, it is also unstructured, changes from day to day, and the linguistic background of the authors can rarely be ascertained. Therefore, the results of such searches are sometimes difficult to interpret. Schmied (2003) offers a comparison of World Wide Web data and ICE-East Africa for the purposes of identifying loanwords from Swahili and their collocates, showing that the two methods—using the World Wide Web and the structured corpus—actually complement each other. Along similar lines, Mair (2007) looks at collocational patterns in L1 and L2 varieties of English from Great Britain, Canada, Australia, New Zealand, India, Singapore, the Philippines, Jamaica, Kenya, and Tanzania on the basis of the country-specific domains on the Web, the BNC, and ICE, coming to the conclusion that collocational profiles may be very useful in characterizing and identifying different varieties of English. These two studies illustrate the fruitful combination of traditional corpora and the Web for lexical or phraseological research.

Another research strategy to access data is to download very large amounts of text from the World Wide Web, which saves valuable time and financial resources in comparison to traditional fieldwork. The most popular text type for this kind of corpus-building is online newspapers, but other, more informal, and interactive text types, such as bulletin boards or discussion forums, have also been used as sources of data. Examples of this line of research are, for example, work by Hoffmann and Mukherjee (2007) on verb complementation in Indian English, for which they relied on about 31 million words from the Indian national newspaper *The Statesman* automatically downloaded from the Web. A similar approach was taken by Hundt and Biewer (2007), who used data from English-language newspapers from Australia, New Zealand, the USA, Fiji, Singapore, and the Philippines to compile a newspaper corpus of South Pacific and East Asian Englishes which comprises about 1.5 million words in total.

Nelson (see International Corpus of English, 2010) employed a similar methodology in compiling the Internet-Sourced International Corpus of English (ICELite) covering Uganda, Papua New Guinea, Sudan, Sierra Leone, and Oceania (Solomon Islands, Tonga, and Guam). By using various Web crawlers, Nelson was able to identify and download texts of almost all written categories of ICE, especially press and administrative texts.

While this Web-based approach yields a lot of data in a short period of time, especially if the newspaper in question provides an online archive, there are also some serious shortcomings. Such data are generated solely from newspapers, which are among the most formal and most internationally standardized genres available, and are thus not very helpful

for assessing less formal usage. In addition, it is also hard to tell whether the texts in question were really written by speakers of the target variety, whether they are based on international news agency material (see Hundt & Biewer, 2007, p. 252), or whether they have been edited by a native speaker of another variety of English (see Schmied, 1996, p. 187). This makes such Web-derived corpora less reliable than traditional corpora.

The use of other text types available on the World Wide Web such as bulletin boards, Weblogs, or discussion forums provides more interactive data and also more control over the authors included, as they usually have a profile on the Web site of the provider in question. An example of the use of discussion forum data is Mair's (2003) study of Jamaican English and Jamaican Creole by residents and expatriates. Although his study is more a qualitative analysis of a relatively small database, it is certainly possible to compile larger corpora of various Web-based text types. For example, a corpus of Weblogs posted in English by Singaporeans of various age groups and L1s is being compiled at the University of Trier, Germany, to study the interplay of standard and nonstandard features in this particular text type (see Sand, 2009).

It has become clear, in this admittedly selective survey of current research on World Englishes based on larger samples of data derived from the World Wide Web, that a vast source of data has become available through the development of the World Wide Web and new software tools, but that this kind of data is also less reliable than the traditional corpora discussed above.

Applications and Future Research

In conclusion, some of the possible applications of corpora of World Englishes will be discussed. As has been pointed out above, the first computer-readable corpora of American and British English as well as their much larger successors have been used in the compilation of reference dictionaries and reference grammars of international Standard English. Thus corpora of L2 varieties of English can also serve as a first step in identifying and eventually codifying an emergent local or regional standard. In McArthur's (1998, p. 87) classification of World Englishes, East Asian, South Asian, and African Englishes are classified as "standardizing," while Caribbean and South Pacific English are listed with a regional standard variety. Corpora can be used to quantify the degree of internal variation within L2 usage and to identify consistent differences from international standard usage of English, thus putting McArthur's classification to the test. This research can then provide the basis for the compilation of dictionaries, grammars, or usage handbooks of individual varieties, which is especially important in a postcolonial context, where the local variety of English is often perceived as lacking when compared to British or American English. A development of linguistic emancipation, which has already happened in former colonies like Australia or New Zealand, can thus be supported for speakers of L2 varieties as well.

Such a process of linguistic emancipation may of course not be restricted to the individual lexeme or construction, but may affect whole text types. Current corpus research on individual text types has shown the emergence of indigenized norms with regard to communicative strategies and textual norms, from discourse pragmatics of Māori English speakers in New Zealand (Holmes, 2008) to job applications from India (Sand, in press). Differences with regard to academic writing, for example, may seriously hamper the chances of being published in mainstream academic journals in Great Britain or the USA for authors from L2 countries. Once such differences on the textual and stylistic level are identified, they can be contrasted to other norms in teaching. Ultimately, the question needs to be addressed whether there really is an international standard of usage for written English, as postulated by Crystal (2003) and others.

Corpora can also be used in a teaching context, both in English-language classrooms in the country in question and elsewhere, to help learners understand variation in English across varieties and across text types (see Schmied, 1996, pp. 193–4). They could also be used as tools for teachers and examination boards for setting realistic standards in exam marking in L2 countries, where the application of British norms and standards is not in line with the linguistic reality of the students.

For all these applications, it is of course necessary to combine corpus analysis with other methods, such as elicitation or language attitude surveys, as the mere occurrence of a certain feature does not necessarily mean that it is accepted as standard usage by all members of a speech community. Nevertheless, a corpus is a good starting point for any linguist wishing to explore World Englishes without resorting to the impressionistic lists of features which had dominated the field in its early days. Corpora also make less salient features accessible and provide information on whether a feature is preferred or dispreferred, whether a feature is restricted to certain contexts or text types, and the degree to which a feature is actually similar to or different from other varieties of English.

Corpus Analysis of European Union Documents

AMANDA MURPHY

The EU as a Multilingual Entity

In linguistic terms, the European Union is a unique entity that boasts 23 official languages. Its institutions constantly generate texts in all languages, which is fertile ground for corpus linguists seeking large quantities of naturally occurring language. The overview presented here briefly considers the nature of these texts, the type of corpus-based research that has been accomplished or is underway, and hypothesizes about future applications of corpus-based research on EU documents.

The policy of multilingualism—the right of all citizens to address the EU institutions and consult legislation in any official EU language—implies that EU documents in all languages have the same linguistic and legal status. This stems from the Union's founding treaty signed in Rome in 1958, which states that the treaty was “drawn up in a single original in the German, French, Italian and Dutch languages, all four texts being equally authentic.” Thus, there are no “original” documents, which are subsequently translated: all the versions of a text, in whatever language, are considered “originals” that enjoy the same legal validity. This singular linguistic portrait entails an enormous body of parallel texts, which invite linguistic investigation from many points of view.

Clearly, in such a context, there is a permanent need for translation and interpretation: indeed, each major EU institution has its own translation unit. Legislation is updated frequently, and since the Union continues to enlarge, the arrival of every new member state also multiplies the number of translation and interpretation combinations by ever-increasing proportions: according to the formula $n.(n-1)$, with 23 official languages, translation combinations currently amount to 506. Translation—both by humans and by machine—is consequently one fruitful area of research into EU documents. Within this vast field, corpus-based translation research is exemplified by the EuroParl corpus, a parallel corpus of parliamentary proceedings in 11 official languages, compiled by Koehn (2005) from the website of the European Parliament. The research is carried out through the EuroMatrix and EuroMatrixPlus projects, dedicated to machine translation of EU languages, funded by the European Commission Seventh Framework Programme for Research and Technological Development (www.euromatrixplus.net).

A second area of corpus-based research is multilingual text mining and information extraction. Within the European Commission (EC), the EU's reference center of science and technology, the Joint Research Centre (JRC), has built a multilingual news-gathering engine (Steinberger, Pouliquen, & Ignat, 2005), which constantly analyzes over a thousand news portals in 19 languages, and provides news summaries and an overview of the most important stories reported all over the world. It can also be used to assess media visibility of issues launched by the EU institutions.

Another area of research supported by the commission is linguistic analysis of legal texts via a publicly available corpus: the JRC-Acquis multilingual parallel corpus (Steinberger, Pouliquen, Widiger, Ignat, Erjavec, Tufiş, & Varga, 2006). The *Acquis Communautaire* is the total body of EU law applicable in member states, and translating this legislation is the

DOI: 10.1002/9781405198431.wbeal0245

first step new member states take in the process of joining the EU. The JRC Multilingual corpus contains only a proportion of the whole *Acquis* and therefore cannot be classified technically as a reference corpus: it does however represent nearly all the 23 languages.

Categorizing EU Documents

The online gateway to the European Union is the point of entry to the countless documents produced by the institutions of the European Union: an overall classification is an arduous task, and there is at present no central agreement between the institutions about document management and archiving. What is clear is that all text types are standardized within the institution in which they originate. The three decision-making bodies—the European Parliament, representing the people within the Union, the European Council, representing national governments, and the European Commission, representing common European interests—work together mostly on legislation, and a large proportion of documents common to all three are concerned with the preparation and discussion of legislation, resulting in amendments to existing documents. Most documents are written by specialists for informed audiences; however, there is a constant drive within the EU institutions to make information transparent and accessible to all its citizens. The president of the European Commission at the time of writing, José Barroso, declared in 2005 that transparency was one of the Commission's strategic objectives. Examples of this are the publicly available Citizen Summaries, which are clear, simple and precise summaries of reports, recommendations, or proposals for legislation, with a maximum length of two pages.

Researchers rarely generalize about EU documents, given the vast range of audience, function, and text type. A few scholar-translators working for the EU institutions, specifically Cosmai (2007) and Wagner, Bech, and Martínez (2002), have drawn up text categories based on their personal experience, rather than on systematic corpus-based methodology. Cosmai makes four broad distinctions: *legislative*, *political*, *administrative*, and *informational* documents, whereas Wagner et al. (2002) uses the terms *Incoming*, *Outgoing*, and *Internal*. Incoming texts are written outside the EU and are translated for members of the institutions; outgoing texts are legislative texts that are applicable to all citizens and must therefore be translated into all the official languages; internal texts include minutes from meetings and administrative documents, which are often translated into just English, French, and German. The online register of documents from the European Commission, on the other hand, available through the EUROPA website, makes five distinctions: (a) agendas of EC meetings; (b) minutes of EC meetings; (c) documents relating to official instruments for which the Commission has sole responsibility; (d) proposed legislation and other Commission communications to the Council and the other institutions, and their preparatory papers; and (e) documents which cannot be classified into the other series. Clearly, categorizations also depend on their use: in a corpus-based study of European Commission documents, Murphy (2008a) identifies five stages of the legislation process alone within which there are 28 different text types.

Corpus-Based Studies of EU Documents

A number of multilingual corpora of EU documents are available through the Evaluations and Language Resources Distribution Agency (ELDA) (www.elda.org). However, published, accessible corpus-based studies mostly concern monolingual corpora of French and English. From a methodological point of view, some of this research could be refined, in that it tends to compare the specialized language of EU documents with general reference corpora, which could be criticized for not being strictly comparable in terms of text types.

Since the 1990s, a Belgian research group has been investigating EU discourse in French in the interdisciplinary context of political science. Using corpus methodology and factor analysis, they investigate ways in which new concepts and ideologies are introduced, change over time, and spread throughout the EU by means of translation into 23 languages. They are interested particularly in words and phrases that re-occur, with or without slight variations, enter networks of meaning across texts, and become concepts with new meanings that are not discernible from the analysis of single instances. Gobin (2000) takes a diachronic view of 14 investiture speeches of presidents of the European Commission in its various forms between 1953 and 1993. She notes three preponderant preoccupations throughout the speeches: (a) the self and the community institutions, expressed through first person pronouns and adjectives, and nouns referring to the institutions; (b) Europe; and (c) the fields of politics and economics. Interestingly, a sharp change is noted from the first presidency of Jacques Delors (1985–9), after which a more socio-political vision of Europe emerges.

Gobin and Deroubaix (2009) report on two corpora: one is an enlarged version of the Gobin (2000) corpus of European Commission President investiture speeches (1953–2000), and the other contains the broad economic policy guidelines from the same years, a recommendation published annually at first, and then every three years by the Council of the European Union. In the presidential speeches, the scholars observe the gradual emergence of words such as *transparence* (transparency) and the changing of meaning of common words such as *travail* (work or labor): before 1981 no mention is made of the *marché de travail* (labor market), whereas *travail* co-occurs with nouns such as *flexibilité* (flexibility) and *mobilité* (mobility) after 1981. Another example is the phrase *taux d'emploi* (employment rate) launched by the Commission in 1994. This phrase gradually replaces *taux de chômage* (rate of unemployment) and *population active* (workforce) in EU discourse as these terms do not adequately account for the people who are actually unemployed and could work.

Again in French, Anderson (2006) investigates a one-million-word corpus of 19 different text types taken from all the EU institutions, as part of an analysis of the French of administration. She compares it with a corpus of the same size of national French administrative language, and also contrasts the two administrative corpora with a two-million-word corpus of non-administrative language. The monograph focuses on the core phraseology of administrative language, both in EU discourse and in French national administrative discourse. The main findings reveal the conservative nature of EU discourse, which contains fewer types of multiword phrases (ranging from three to eight items) than both French national administration discourse and general French. EU discourse is also shown to be repetitive, since the multiword phrases, though fewer in types in the EU corpus, are used more frequently than in both comparable corpora. A comparative analysis of the keywords and *locutions* (idioms) points in the same direction: EU discourse contains fewer keywords with more restricted phrasal patterns and collocations, and fewer locutions, which are more frequently used. Anderson also considers the different genres within the register, and shows that the greatest proportions of multiword sequences are found in genres of a legal nature, either primary legislation, such as European treaties, or secondary legislation, which makes extensive reference to existing legislation, and cross-references within the same document. The language of EU documents is thus shown to rely strongly on repeated multiword sequences.

Turning now to English, research into EU discourse is conducted with both pedagogical and descriptive aims. A pedagogical example of a corpus-based project on a specific EU text type is Connor and Mauranen (1999), who investigate the language of grant proposals for European Union research funds. Grant proposals are a genre within academic writing, but they can also be considered a genre of EU documents, given the number of standardized documents sent to the EU requesting research funds. Based on 34 grant proposals written

by Finnish scientists, the research identifies the grant proposal as a form of persuasive writing, leading to a guide to writing successful proposals, which recommends ten necessary functional moves.

The lexis of EU documents is specialized and standardized and the EU institutions have made efforts to clarify terminology for the public by providing online tools such as the multilingual term base, Interactive Terminology for Europe (IATE), which explains important terms in all official languages (<http://iate.europa.eu>). These tools, however, do not necessarily suffice in a teaching context. In Hungary, for example, a member state since 2004, research was prompted by the challenge to find teaching materials for students aiming to work for the EU institutions. Trebits (2008, 2009a, 2009b) formed the Corpus of EU English (CEUE) from documents with legal, business, and political purposes. The 200,000-word CEUE is designed to represent the diverse fields of EU activity, and contains 19 information booklets written for a broad, informed audience, one annual report of EU activities from 2006, and sample test material from recruitment competitions in all subject areas.

Examining the corpus from the point of view of lexis, Trebits (2008) finds that 46.5% of lexical words in the CEUE are not among the most frequent 3000 words in the BNC (British National Corpus), which indicates a high percentage of EU-specific lexis (www.natcorp.ox.ac.uk). (Incidentally, many of the EU-specific words identified are not present in the online terminology databases on the EUROPA site, which might indicate that these tools were not devised according to corpus methodology.) Collocations are equally important as typical factors of EU-lexis: analyses of the clusters around common words show useful patterns for learners, such as the abbreviation *EU*, the tenth most common lexical word in the CEUE, which is frequently preceded by the definite article and by a set of common prepositions, producing set phrases such as: *within/between/throughout/by/across/from/outside the EU*.

Trebits (2009a) examines phrasal verb constructions in the CEUE. A comparison of the frequency lists of phrasal verbs in the CEUE and in the BNC shows that half of the 25 most frequent phrasal verbs in the former do not appear in the equivalent list from the latter, indicating that they are distinguishing features of EU document English. Another important finding concerns the semantic analysis of these phrasal verbs: the word-senses associated with the most common phrasal verbs that occur in both corpora are systematically narrower in the CEUE than in the BNC. For example, the phrasal verb *set up* occurs with two different word-senses in the CEUE compared to 15 different senses in the BNC. Trebits (2009b), instead, investigates a third area in which the language of the CEUE is shown to differ from the BNC, which is that of conjunctions.

The last group of corpus-based studies of EU documents in English dealt with here regards the typical phraseology of EU documents, and the analysis of the versions written by non-native speakers subsequently edited by native speakers. EuroCom is a one-million-word parallel corpus compiled of non-edited and edited documents from 31 different directorates general of the European Commission (Ulrych & Murphy, 2008). In line with findings reported here about French EU language, a comparison of three-word units in EuroCom with those in the BNC brings to light a strong auto-referential strain in EU documents, with frequent mention of the European Union, its member states, and references to specific directives, regulations and their implementation. Murphy (2008b) reports that in terms of phraseology, three-word phrases such as *in order to* and *as well as* occur with much greater frequency in EU documents than in the BNC: text analysis of the contexts of such three-word phrases reveals a tendency toward explicitation in specialized EU texts. Interestingly, this holds both for texts written by non-native speakers of English, and for those revised by native speakers. In other words, editors of EU texts written by non-native speakers do not always remove these three-word phrases. From this angle,

edited texts resemble translated texts, which are known to be characterized by a high level of explicitation.

The European Union institutions are increasingly present in the lives of European citizens, particularly through legislation. A vast store of text types in all the official EU languages are available for investigation, and since the EU institutions wish to dialogue with citizens, more research into the language of these documents would be socially relevant. If evidence-based comparative research were conducted into, for example, document design, clarity, and comprehensibility, by comparing them to comparable specialized corpora, the workings of the EU in its multifarious areas of influence might become clearer to citizens, which would be mutually beneficial. Corpus-based analysis of EU documents is still in its infancy, but there are viable paths worth exploring.

Corpus Analysis of Historical Documents

KATE TRANTER

Historical documents are often used in applied linguistics as a source for studying the structure and use of language in the past. Linguists compile corpora such as the Representative Corpus of Historical English Registers (ARCHER; <http://www.llc.manchester.ac.uk/research/projects/archer/>) or the Penn-Helsinki Parsed Corpus of Early Modern English (PPCEME, 2004; <http://www.ling.upenn.edu/hist-corpora/PPCEME-RELEASE-2/index.html>), using a variety of text types and covering a wide period. They are used for diachronic linguistic studies, to show, for example, lexical or grammatical differences between Early Modern English and present-day English (e.g., Hundt, 2007), or the structure of a particular language variety (e.g., Dollinger, 2008). In this way the analysis of historical corpora contributes to the understanding of earlier forms of a language and of language variety and change.

Further, linguists create and analyze historical corpora which include information about social or historical contexts. The Corpus of Early English Correspondence CEEC (1998; <http://www.helsinki.fi/varieng/domains/CEEC.html>), for example, aims “to facilitate sociolinguistic research into the history of English” and provides a supplementary database with extralinguistic, socioregional information on the corpus and its informants. This type of information can be combined with corpus linguistic analysis to draw wider conclusions about language in its historical context. This is demonstrated by studies such as Nevalainen and Tissari’s (2010) study of 18th-century politeness.

Following the so-called “linguistic turn” in the humanities of the 20th century, historians have also become interested in the history of language change, its contexts and implications. This is evident in the field of conceptual history or German “Begriffsgeschichte” (e.g., Koselleck, 1978), which overlaps with the field of historical semantics (e.g., Teubert, 1989). In addition to this focus on semantic change, many historians have also developed a greater awareness of the role language plays in discourse in general. They have looked to other linguistic approaches such as speech act theory and discourse analysis to help explain the content and context of their texts. Some have created small corpora and used corpus tools to analyze them (e.g., King, 2008).

However, despite this interest and the wealth of text at their disposal, much of which is electronically stored, historians have not generally cooperated with corpus linguists (or vice versa) in the compilation and evaluation of corpora. Yet corpus linguistics is not merely a “method,” but is embedded in the search for meaning shared by other disciplines. Thus a further application of corpus linguistics to historical documents is the interpretation of corpus data by linguists and historians in cooperation. Research questions and insights in either discipline can arise both from the results of corpus analysis steered by linguists working with historians, and from historical analysis steered by historians working with linguists.

Linguists and historians alike face problems when compiling corpora from historical documents. Relevant documents, whether for public or private use, are not necessarily printed or published. While some are well-preserved and easily available, others are damaged, difficult to read, and incomplete. This means that a historical corpus will often

not be made up of a broad variety of texts taken from many different contexts as are the large contemporary language corpora such as the British National Corpus (BNC, 2007; <http://www.natcorp.ox.ac.uk/>) or the Corpus of Contemporary American English (COCA, 2008; <http://www.americancorpus.org/>). It can consist only of those texts which have been preserved and can be accessed by historians. This generally results in small, specialized corpora compiled by scholars for their own use. Increasingly, though, such corpora are being made more widely available electronically and stored for use in accessible databanks such as the Oxford Text Archive (<http://ota.ahds.ac.uk/>).

The compilation of these small historical corpora can be problematic. Typically they contain all the available written documents of their narrow focus, such as for a particular year or parish, and are restricted to one particular text-type. This may seem of advantage to historians because they concentrate closely on the sources and use all the relevant texts available. But it does not make the corpus representative in that “findings based on its contents can be generalized to a larger hypothetical corpus” (Leech, 1991, p. 27). A relatively homogeneous text-type or a narrow time period in the corpus may lead to a lack of balance within it and therefore to unreliable results. A corpus of letters, for example, where one person has contributed a disproportionate number of letters or letters of disproportionate length, can give the corpus and its results an unwanted bias. On the other hand, an advantage of these small “tailor-made” corpora is that, in contrast to larger “off-the-peg” corpora, they permit the origins and wider context of their texts to be more easily reconstructed. As a result they are also suited to different types of linguistic analysis, including qualitative discourse analysis. As with all corpora, their usefulness depends on their linguistic analysis.

Similar care has to be taken when choosing or compiling a reference corpus. Software such as WordSmith (Scott, 2008) allows a reference corpus to be compared with the text corpus to indicate words of unusual or unexpected frequency in “keyword” lists. The choice of reference corpus may influence the significance of the results. If, for example, for a corpus of 18th-century pauper letters, the reference corpus is compiled from 18th-century literary texts, the keyword results may be different from those resulting from a comparison with a modern corpus. Corpus users and interpreters need to know how results are obtained in order to understand their significance.

Increasingly large amounts of historical text are being digitized and made available online, such as through Early English Books Online (EEBO; <http://eebo.chadwyck.com/home>) or the US national archives (NARA; <http://www.archives.gov/historical-docs/>). These vast resources could provide material for text and reference corpora (Crane, 2006). To be useful for corpus studies, texts need to be available in full text rather than page images. Yet most optical character recognition (OCR) software used to convert text images into full text has difficulty with deviations of spelling and handwriting, typically relating to abbreviations and older materials (Balk, 2009). This means there is a wide potential for error, unless time-consuming hand-editing is undertaken, and results may be distorted.

Corpus linguistic tools such as concordance software will only be accurate if they recognize and annotate lexis in a text correctly (Barnbrook, 1996). Standard tools used to annotate texts to show parts of speech (POS tagging) and components of sentences (syntactic parsing) may not recognize historical variants. But if this annotation is inaccurate, it may lead to faulty analysis, for example of grammatical functions in a text, without the analyst being aware of it. Some of these difficulties can be overcome by adding variants to the POS tagger or “backdating” the lexicon to adapt it to the texts concerned (Archer, McEnery, Rayson, & Hardie, 2003), or by standardizing spelling before using a modern POS tagger such as CLAWS (Garside & Smith, 1997; <http://ucrel.lancs.ac.uk/claws/>). However, standardizing elements of the text to fit modern tools may distort it and obscure elements which are important for analysis and interpretation, such as text provenance or

author literacy. Other tools are being developed to solve this dilemma, such as the variant detector VARD (Baron & Rayson, 2008), which can detect spelling variants and insert modern equivalents alongside them. For semantic tagging the problem is even more acute, given the extent and speed of meaning change over time. Rayson, Archer, Piao, and McEnery (2004) have developed a historical semantic tagger for Early Modern English, USAS (<http://ucrel.lancs.ac.uk/usas/>). It indicates the conceptual field of a word and so permits scholars to identify semantically related areas in a corpus. Semantic relations can also be traced using the *Historical Thesaurus of the Oxford English Dictionary* (Kay, Roberts, Samuels, & Wotherspoon, 2009), which provides a comprehensive guide to meaning change from Old English to the present day, and also denotes parts of speech. The Digital Editions for Corpus Linguistics (DECL; <http://www.helsinki.fi/varieng/domains/DECL.html>) project also aims to overcome some of these problems by creating a framework to produce online editions of historical texts which can be used for corpus-based study but also expose their original features (Honkapohja, Kieslaniemi, & Martilla, 2009). Compilers and users of historical corpora need to be aware of these problems and possibilities in order to obtain reliable results and gain the maximum benefit from a corpus study.

Applying corpus linguistic methods to historical texts holds new potential for their analysis and interpretation. Discourse analysts and critical discourse analysts are increasingly interested not only in corpus methodology as such but also in its ability to shed light on the wider meaning of texts or on their hidden discourse (e.g., Mautner, 2009). Corpus linguistics has the potential to cross the lines into other fields of linguistics. In genre analysis, for example, discourse unit patterns can be determined by preceding corpus analysis, and typical linguistic patterns can be corroborated by subsequent corpus analysis of discourse units (Biber, Connor, & Upton, 2007). In the case of historical documents, corpus linguistics can, therefore, enhance both their quantitative and qualitative analysis, and substantiate their interpretation by linguists and historians alike. This is a valuable application of corpus linguistics to research in other disciplines.

Corpus Analysis of Key Words

PAUL RAYSON

Introduction

If you look up “key word” in a dictionary you will find that it has various senses, but the relevant sense here is a word that has importance or significance especially to describe the contents of a document. In the context of corpus analysis, the accepted definition of a “key word” extends this sense to a *statistically* significant word characterizing a document, text, or corpus. The procedure to extract key words from a corpus is one of the most regularly used tools in a corpus linguist’s toolbox alongside frequency profiling, concordancing, and collocation analysis. Numerous studies in linguistics and other disciplines have exploited the key-words procedure for the analysis of textual data, ranging from a discourse analysis of refugees and asylum seekers in the UK press, studies of health communication, lexical simplification in translations, profiling of learner language, to e-learning materials development. The key-words procedure is inherently comparative. In order to discover the statistically significant key words in a corpus, we compare it to a (usually larger) reference corpus and extract the words that occur significantly more or less frequently compared to what we expect based on the reference document.

There are several further meanings of “key word” in the language- and text-processing literature that we turn to briefly here. In the area of information retrieval (IR), the science of indexing and searching for information in document collections or on the Web, a “key word” is a manually assigned word or phrase given as a label to a book or article by an author or human abstracter. Techniques have been proposed in IR to extract such key words automatically from text (notably Sparck Jones, 1971) and some of these measures are now finding their way across to the community of corpus linguistics (Oakes, 2008). Similarly, one can assign key words to photographs or images to assist in their retrieval (Zhou & Huang, 2002). Early work in semantics was carried out by Firth (1935) on “focus and pivotal words” and this laid the groundwork for much that was to follow. Cultural key words are “words which capture important social and political facts about a community” (Hunston, 2002, p. 117). Williams (1983) produced a set of around 120 words which were important in the culture but were selected subjectively. Stubbs (1996, p. 172) made his selection of words based on characteristic collocations to show the associations and connotations that they have. Wierzbicka (1997, p. 16) in trying to understand cultures through their key words had no “objective discovery procedure” for them. Finally, Stubbs (2010) compared and contrasted the concepts of cultural key words with the statistical key words that we shall focus on here.

Having now examined the core and related definitions for key words, in the next section we will further clarify what statistical key words are and define the process by which they are calculated. Next, we will focus on problems and limitations of the technique and possible solutions to them, before concluding by considering a variety of applications for this technique by way of further literature for the reader to explore.

Method: How Are Key Words Calculated?

The procedure to calculate key words can be applied mechanically, is conceptually quite straightforward, and is comprised of three stages. The first stage is to compute a word-frequency list for each of the two texts that we wish to compare. One of these texts would usually be the larger reference corpus mentioned above. For each text, the word-frequency list records the different word forms (types) and how many times they occur (tokens). We also count the total number of running words in each text. The second stage is to compare the two resulting frequency lists. Some complexity arises in the application, choice of statistical test, and the assumptions made in such calculations and we will further describe these issues below. Conceptually the comparison is again quite straightforward. For each word in the two texts, we apply a statistic or formula that compares its relative frequencies (i.e., percentages of occurrence) in the word-frequency lists. The value of the statistic or “keyness” is proportional to the difference in relative frequencies. In other words, the larger the difference in relative frequencies, the larger the value of the statistic or “keyness.” The third and final stage of the process is to sort the words in terms of their keyness. This means that, all other things being equal, the most interesting key words with the largest keyness values appear at the top of the list. The least interesting words, whose relative frequency is similar in the two texts, are listed toward the bottom of the key-words list. We can further distinguish between positive and negative key words. Positive key words are those which are “overused” in the first text: their relative frequency is higher in this text compared to the second or reference text. Negative key words are said to be “underused” in the first text relative to the second since their relative frequency is lower in this text compared to the reference corpus. In most cases, it is the positive key words that are most interesting since they tell us about what occurs more often in the first text.

In terms of the second stage and the application of the keyness statistic, we first need to construct a “contingency” table for each word in the frequency lists. Then we apply our chosen statistic to calculate the keyness value. The most widely used methods are log-likelihood and chi-squared. Other keyness statistics have been proposed; see Baron, Rayson, and Archer (2009) for a detailed survey and discussion of the criticisms of these statistics. Chi-squared was first used in a corpus analysis context by Hofland and Johansson (1982) to compare word frequencies in corpora of 1 million words of American English (the Brown Corpus) with 1 million words of British English (the LOB Corpus). The chi-squared values can be looked up in statistical tables (of the chi-squared distribution) in order to identify those that are statistically significant at different levels of confidence, for example 5%, 1%, and 0.1%. Each level corresponds to a cutoff and a probability (or “ p ”) value. For example, the 5% level (or p value of 0.05) corresponds to a keyness critical value of 3.84. Hence any words with a chi-squared value greater than or equal to this value are considered significant. At the 1% level, p value of 0.01, the critical value is 6.63. We can specify smaller p values and correspondingly higher critical values in order to be more certain of our results. This mathematical process is known as hypothesis testing and the default or “null hypothesis” in this test is that there is no difference between the actual frequencies we observe in the two corpora. A high enough keyness value allows us to reject this null hypothesis for a given word, although it should be noted that, strictly speaking, this does not logically entail support for the alternative hypothesis, that there is a difference between the actual frequencies.

Log-likelihood (LL) was first brought to the attention of the corpus community by Dunning (1993) for collocation analysis. LL has been shown to be more reliable than chi-squared in a number of different arrangements of corpus comparison (Rayson, Berridge, & Francis, 2004) such as varying the relative sizes of the corpora and across the range of

Table 1 Contingency table for keyness calculation

	<i>Corpus 1</i>	<i>Corpus 2</i>	<i>Total</i>
Frequency of a word	<i>a</i>	<i>b</i>	<i>a + b</i>
Frequency of other words	<i>c - a</i>	<i>d - b</i>	<i>c + d - a - b</i>
Total	<i>c</i>	<i>d</i>	<i>c + d</i>

word frequencies. Hence, we will present it here. This simpler version of the formula comes from Read and Cressie (1988, p. 3) who show that chi-squared and log-likelihood come from the same family of statistics.

Table 1 shows the contingency table that we need to complete for each word in the frequency lists. The values “*a*” and “*b*” are the “observed” or actual frequencies of the words in the two corpora. The total size of each corpus is shown by “*c*” and “*d*.” We first calculate “expected” values for each word using the following formula:

$$E_i = \frac{N_i \sum_i O_i}{\sum_i N_i}$$

The expected values are simply averages for each word adjusted for the corpus size. In this formula, “*N*” corresponds to the total number of words and “*O*” corresponds to the observed value. From Table 1, $N_1 = c$, and $N_2 = d$. So, we calculate $E_1 = c \times (a + b) / (c + d)$ and $E_2 = d \times (a + b) / (c + d)$. The final log-likelihood value is then calculated using the following formula:

$$LL = 2 \sum_i O_i \ln \left(\frac{O_i}{E_i} \right)$$

The formula represents the distance of the word frequency in each corpus from the previously calculated expected or average values. In terms of Table 1, $LL = 2 \times ((a \times \ln(a / E_1)) + (b \times \ln(b / E_2)))$. This result can be calculated using a simple spreadsheet, although we have to be careful about calculating $\ln(0)$, so in practice we ignore that half of the calculation if “*a*” or “*b*” are zero.

A very important caveat is required at this point. Statistical goodness-of-fit procedures such as chi-squared, the log-likelihood metric and others assume that samples are random with independent observations, but of course we know that language corpora do not abide by these assumptions (Stubbs, 1995; Kilgariff, 2005; Evert, 2006; Baroni & Evert, 2007). Gries (2005) also highlights the fact that corpus linguists rarely apply a correction for multiple “post-hoc” testing as takes place in the key-words procedure and points out that this correction is more common in other disciplines. The usual sidestep taken by linguists who are aware of these criticisms is to employ the metrics to calculate the keyness values and use them only to place the key words in rank order rather than determine significance for each word. If we put less reliance on the significance-testing component of the procedure, it can be used informally to guide our analyses (Rayson & Garside, 2000).

Scott defined, refined, and applied this key-words process with his WordSmith software in a number of papers (1997, 2000a, 2000b, 2001a, 2001b, 2002). As we have seen, the procedure is inherently comparative and usually involves a general reference corpus. It can also be used to compare a text with other relevant texts (Rayson & Garside, 2000; Seale,

Ziebland, & Charteris-Black, 2006). There are at least three important considerations to bear in mind when choosing the reference text: representativeness, homogeneity, and comparability. Representativeness (Biber, 1993) is an important attribute for a reference corpus. To be representative, a corpus should contain samples of all major types of text (Leech, 1993) in some way proportional to their use in “everyday language” (Clear, 1992). This allows us to discover features in the study text with significantly different usage to that found in “general” language. Where we are comparing corpora of roughly equal sizes, as in the Hofland and Johansson (1982) study to compare British and American English, homogeneity is important since we may otherwise find that the results reflect certain sections within one of the corpora that are unlike the remainder of the two corpora being compared. Comparability refers to the sampling methods employed in the collection of each of the corpora and ideally the same sampling methods should be employed in each case. For example, the LOB Corpus was created to be comparable to the Brown Corpus and its compilers used the same design and collection procedures. This renders the results directly comparable and avoids any unintended surprises such as key words arising because the corpora are sampled from a different time period, genre, or domain.

Problems, Limitations, and Extensions of the Technique

In addition to the caveats already expressed above, there have been some criticisms of the key-words approach. Berber Sardinha (1999) highlighted one drawback in that there are normally far too many key words for the researcher to analyze. Baker (2004a) noted three points in relation to the technique. First, “a key word analysis will focus only on lexical differences, not lexical similarities” (Baker, 2004a, p. 349). Comparing, as Baker did, two corpora of gay and lesbian erotic narratives to general corpora such as Brown or LOB would produce different key words than when comparing the erotic narratives to each other. This reinforces the careful choice of a reference corpus as of prime importance. Second, a word may be key because it occurs very frequently in one part of a corpus. Hence, examining the range or dispersion of a key word is important. Third, “key words only focus on lexical differences, rather than semantic, grammatical, or functional differences” (Baker, 2004a, p. 354). It is possible to find cases where a word is key when it appears with a number of different meanings in the text and, in contrast, cases where a word does not get marked as key because counting all of its senses together hides the fact that one of the senses is key when counted separately. Gries (2006, p. 116) also stated one obvious limitation of key-word variability studies as “they have little or nothing of interest to offer a linguist who is primarily interested in grammatical or other phenomena.”

The methodology presented in the previous section has been fairly stable. There are alternatives in the statistic used as described above. Recent explorations, for example Scott’s article (2009) on the search for a bad reference corpus, have allowed us to see the limitations and the robustness of the technique itself by examining the effect of choosing different reference corpora.

In terms of revisions to the technique, Scott (1997) right from the start extended the procedure to find “key key words.” These are words that are shown to be key in a number of files within a corpus. Mahlberg (2007) showed that the keyness procedure applied to lists of clusters (recurrent phrases or n-grams) can produce useful results for studying local textual functions in literary stylistics. In order to address the criticisms of the key-word procedure as discussed above, Rayson (2008) proposed an extension to the process to include key parts of speech and key semantic domains as implemented in the Wmatrix software. This exploited automatic corpus-annotation tools that assign a grammatical label and semantic field tag to every word or phrase in a corpus. The frequencies of these tags were counted to produce tag-frequency lists and then the keyness calculation was applied

to those lists in addition to the word-level lists. As a result, at the semantic level, words are grouped together into semantic fields which do not emerge from the word-level analysis, thus allowing a richer and deeper set of key items to emerge. The practical problem of too many words to examine is also partially solved because of the smaller number of semantic groups that need to be checked.

Example Applications

By way of a small example, the key-words procedure was applied to the full text of “Alice’s Adventures in Wonderland” (one of the most frequently downloaded texts from the Internet Archive and Project Gutenberg; see online resources). The total text is around 27,000 words long and it was compared to the British National Corpus written sampler (1 million words). As Scott notes, many of the top key words in any comparison are personal names and this can be seen in the results here. The top 20 key words are (in order of keyness): *Alice, she, said, turtle, hatter, gryphon, I, it, mock, you, herself, dormouse, Queen, rabbit, her, house, March, caterpillar, very, duchess*. Using a *p* value of 0.01, there are 1,189 words above the critical log-likelihood value of 6.63, giving plenty of words to examine in further analysis.

The key-words procedure has been used to address a wide range of research questions in linguistic analysis. Leech and Fallon (1992) used the items marked by Hofland and Johansson (1982) as significant and examined cultural differences using corpora of British and American English. Baker (2004b) used key words to examine discourses of homosexuality in the UK House of Lords debates on gay-male law reform. Toolan (2006) highlighted the growing trend of use of the key-word procedure for literary analysis as a way of discovering foregrounding, structuring, and reader-guiding in a text. There are many further examples on the Web pages of WordSmith and Wmatrix tools listed in the suggested readings below. Scott and Tribble (2006) also showed how key words and other related corpus analysis techniques can be used in language education and teaching.

Corpus Analysis of Language in the Workplace

LOUISE MULLANY

Applied linguists in various parts of the world have demonstrated the value of investigating language in the workplace from a corpus linguistic perspective. The term “workplace” is frequently used as a broad category to incorporate a range of contexts including businesses, organizations, and institutions where individuals are involved in some form of employment. This can be in public, private, or voluntary sectors, and it covers employees across all socioeconomic categories and at all levels of workplace hierarchies. Researchers specializing in language in the workplace are interested in a range of topics where the findings of linguistic studies can be of benefit to employees in their everyday working lives. The findings of language in the workplace studies can be of practical relevance to a range of audiences including academics, workplace practitioners and trainers, language teachers, speakers or writers who have taken part in studies, along with future workplace employees. Corpus linguistics has provided language in the workplace researchers with a suite of techniques to highlight linguistic patterns of use based upon large amounts of workplace data. This entry will highlight corpora that have played important roles in the development of this area of study. Key findings and research issues will also be highlighted.

Analytical Approaches to Workplace Language Corpora

A number of workplace language corpora have emerged since the turn of the 21st century. These collections have enabled researchers to make a series of ground breaking observations regarding language use in the workplace. At this point, it is useful to clarify that the term “corpus” is used in this entry to refer to a collection of texts. Some researchers have compiled a corpus of language in the workplace and then examined the data using analytical techniques from sociolinguistics and discourse analysis. The Language in the Workplace study at Victoria University of Wellington in New Zealand is an excellent example of this (e.g., Holmes & Stubbe, 2003; Holmes, 2006). Others researchers have compiled workplace language corpora and then investigated these data using corpus linguistic tools and techniques, often referred to as electronic forms of textual analysis (Adolphs, 2006). A good example of this is the work of Handford (2010), who compiled and analysed CANBEC, the Cambridge and Nottingham Business English Corpus. Both the New Zealand workplace project and Handford’s project will be examined in more detail later in this entry.

When electronic forms of textual analysis are used, they do not tend to be used in isolation. Corpus linguistics researchers tend to combine corpus approaches with other, more qualitative analytical approaches including discourse analysis, pragmatics, and genre studies. Corpus linguistics is most frequently used as a starting point to produce an overall survey of workplace data to establish any identifiable patterns of language use. Researchers can then expand upon the findings of these patterns with more detailed qualitative analysis, by integrating methods and approaches from other linguistic sub-disciplines. Handford’s (2010) work provides a prime example of this.

Gaining access to workplaces for any linguistic data collection is far from straightforward, and compiling a workplace corpus, especially if naturally-occurring speech in a range of different workplaces is desired, is often a difficult and lengthy process. However, as Sarangi and Roberts (1999) point out, even if access is really difficult, researchers should persevere with any institutional/organizational research sites, including workplaces. They are under-researched contexts, and are important to investigate since many of us spend the majority of our everyday lives in workplace environments. For corpus linguists, once the corpus has been collected and transcribed it can be explored from a variety of different linguistic perspectives and, if appropriate, it can be added to in years to come.

Some of the most significant corpus studies of the workplace that have been produced so far have focused on naturally-occurring speech (e.g., Holmes & Stubbe, 2003; Cheng, 2004; Handford & McCarthy, 2004; Warren, 2004; Holmes, 2006; Handford, 2010; Koester, 2010), though investigations have also been successfully conducted by examining written texts. Written analysis includes a focus on authentic texts (Nickerson, 2000) and also on texts that have been produced in controlled environments specifically for the purposes of the research project (Upton & Connor, 2001). Some investigators combine a spoken and written focus in their corpus (Nelson, 2000, 2006). The advent of new technologies has also opened up a range of different media of written communication that can be successfully investigated using corpus approaches, particularly as various forms of electronic communication have become so commonplace in everyday workplace interactions (e.g., Nickerson, 2000; van Mulken & van de Meer, 2005). Furthermore, the move toward the production of multimodal corpora, where features of gesture, pose, and gaze are analyzed alongside speech patterns, means that corpora with wide-ranging foci and data collection techniques are emerging (e.g., McCowan et al., 2003; Chen et al., 2005; Mana et al., 2007).

Workplace Corpora: Illustrative Examples

One of the largest and most successful corpus collections of workplace language is the aforementioned New Zealand Language in the Workplace project set up by Janet Holmes and colleagues. This corpus began in 1996 with government funding and it has grown rapidly since then. At the time of writing, it consists of over 1,500 interactions involving 450 people from 20 different workplaces including government departments, factories, hospitals, and corporate businesses. A great deal can be learned from its innovative methodological approaches to workplace data collection, as well as from its successes in ensuring that its research findings are of applied relevance.

All studies within the project have an overarching commitment to improving communicative effectiveness and the everyday working relationships of individuals within workplaces. The variety of different types of workplaces included in the corpus has enabled a range of topics to be focused upon, including how language use in the workplace can be influenced by gender (Holmes, 2006) and ethnicity (Schnurr, Marra, & Holmes, 2007). Researchers have also examined leadership language and workplace cultures (Schnurr, 2009), linguistic politeness (Holmes & Stubbe, 2003), and the importance of social talk and humour in everyday workplace interactions (Holmes, 2000a, 2000b).

Alongside its intellectual value within academia, this project provides an excellent set of illustrations of how applied linguistics findings can be of practical relevance to audiences outside of academic contexts, including workplace trainers, practitioners, and everyday employees. For example, Victoria University of Wellington runs a programme for immigrant workers to teach the different communicative norms of New Zealand workplaces in order to help workers find successful employment, based on their corpus findings. Researchers have also disseminated their findings in media interviews and television

appearances. They have published in non academic sources, including magazines and articles specifically designed for a lay audience. They have produced what they term “communication evaluation models,” in conjunction with human resources managers in workplaces, to aid effective communication amongst employees. They have hosted seminars and workshops on the findings of the data in all workplaces where corpus collection took place. They have authored a series of brochures aimed at end-user groups, and they also offer official language consultancy services to businesses. Further details of these practitioner-orientated resources can be found at the project’s website (see Online Resources below). Each of these activities provides a successful model for academics to follow in order to make a difference in terms of research dissemination.

Although this encyclopedia has a separate entry on corpus analysis of business language, a significant number of language in the workplace corpora to date, including the New Zealand corpus, have focused on the language of businesses as an integral area of investigation within the “workplace” as an overarching category. It is therefore important to spend some time focusing on other notable examples of this work in order to present an inclusive overview of the field. Nelson’s (2000) Business English Corpus (BEC) was one of the first, and is made up of two corpora. The first is a collection of business English materials taken from 33 textbooks, which amounts to 600,000 words. The second corpus consists of what Nelson terms “real” business English. This consists of authentic spoken and written materials, and stands at just over one million words. The data include emails, faxes, and reports, along with spoken material from meetings, negotiations, and telephone conversations.

Nelson used WordSmith Tools (Scott, 1999) to conduct a keyword analysis of his corpus. He used a subset of the British National Corpus (BNC), known as the BNC Sampler, as a reference corpus. The BNC Sampler is a subset of the 100-million-word BNC, containing one million words of spoken and one million words of written texts. The Sampler texts have been carefully selected so that they mirror the much larger BNC. Comparisons with the BNC Sampler enabled Nelson to assess both how business English differs from general English, and how textbook materials differ from the “real” business language collected in naturally occurring settings. He found that the everyday language in real-life settings did not correlate with the advice given in English language teaching textbooks. He also confirmed his hypothesis that business English differs from general, everyday language. He found that textbooks too often included lexis that did not appear in real-life interactions. While the textbooks focus on impersonal and nonemotive language, in authentic workplace interactions there was a strong focus on personal and interpersonal lexis and politeness. Nelson’s findings have clear practical relevance for language teachers, textbook producers, and educational policy makers. Nelson has a set of resources relating to his findings available online (see Online Resources below).

The Cambridge and Nottingham Business English Corpus (CANBEC) was compiled between 2000 and 2004 by Mike Handford under the directorship of Ronald Carter and Michael McCarthy at the University of Nottingham, in conjunction with Cambridge University Press (Handford & McCarthy, 2004; Handford, 2010). CANBEC consists of a variety of corporate workplace texts. Most of the data come from businesses based in the UK, though the corpus also includes interactions from Japan, Ireland, Spain, and Germany. Handford and McCarthy (2004) explore a range of keywords in context (KWIC), using a 5-million-word corpus of informal, naturally occurring spoken language, known as the Cambridge and Nottingham Corpus of Discourse English (CANCODE), as a reference corpus. They then move on to a qualitative analysis by looking at concordance lines in context. Their results accord with Nelson’s (2000) finding that business workplace language shares many features with everyday, interpersonal social talk, again providing empirical evidence which contrasts with advice given in business language textbooks.

Mullany (in press) has examined the CANBEC data from the perspective of language and gender, using frequency lists to search for lexical items containing direct gender referencing, for example, *girl*, *boy*, *man*, *woman*, to ascertain how, where, and when gender becomes the topic of conversation in workplace business meetings. This initial survey is followed by a concordance analysis, combined with sociolinguistic and discourse analytical techniques (see Baker, 2006, 2010), to examine how gender and sexuality are enacted by workplace professionals.

CANBEC has also been used alongside other corpora. Koester (2006, 2010) combines an analysis of CANBEC with a corpus analysis of ABOT, an informal corpus of office talk in the United States. This enables her to produce a wider-ranging investigation of different facets of workplace language genres.

Adolphs, Brown, Carter, Crawford, and Sahota (2004) illustrate the important role that corpus linguistics can play in analyzing the language used by healthcare professionals when giving advice in medical workplaces. They focus on a small corpus of telephone conversations taken from the 24-hour British telephone nursing helpline, NHS Direct. They use WordSmith Tools to produce a keyword analysis, with CANCODE as a reference corpus. They combine corpus analysis with conversation analysis to highlight how nurses' linguistic strategies, including politeness markers, modals (linguistic expressions that emphasize possibility or necessity), backchannels (linguistic strategies of listener encouragement), and conversational endings, where medical information is succinctly summarized, can have a positive impact on a patient's compliance with medical advice. They situate their corpus investigation within "applied clinical linguistics" and their findings have clear practical implications for healthcare practitioners, trainers, and NHS Direct nurses themselves.

Researchers at the Hong Kong Polytechnic University have compiled the Hong Kong Corpus of Spoken English (HKCSE; see Cheng, 2004; Warren, 2004; Cheng & Warren, 2006), which currently stands at just under one million words. It has a subset drawn from a range of workplace business contexts including meetings, job interviews and presentations, telephone conversations, office talk, and service encounters. This subset totals 500,000 words. The service encounter category includes the workplace language used in a five-star Hong Kong hotel (Cheng, 2004). By examining word frequencies and collocations at the front desk of the hotel when customers are checking out, Cheng's analysis pinpointed occasions where intonation and lexicogrammatical inaccuracy had caused communication problems between the hotel desk employee and the customer. For example, the frequency analysis highlighted "minibar" as a frequently occurring lexical item. However, if the wrong discourse intonation was used, combined with lexicogrammatical inaccuracy, then a request by front desk staff about minibar use could appear as an accusation. Cheng (2004, pp. 154–9) outlines the practical relevance of her findings for a number of different groups including English for specific purposes (ESP) teachers and providers, hotel professionals, front office staff, and corpus or applied linguists.

The corpus linguistics research team at Hong Kong Polytechnic University has released a range of other profession-specific written corpora including the Hong Kong Corpus of Survey and Construction Engineering, which is nearly 6 million words, the Hong Kong Engineering Corpus, at just over 9 million words, and the Hong Kong Financial Services Corpus, which totals just over 7 million words. Links to these corpora can also be found online (see Online Resources below).

Upton and Connor (2001) use a different type of written text in their workplace corpus, which consists of job application letters. It is known as the Indianapolis Business Learner Corpus (IBLC). The corpus contains 200 letters, composed by students from five different countries, who were studying business communication as part of a writing training course. Therefore, the letters are not examples of authentic workplace communication, but they

can still be useful to analyze from a corpus perspective, especially as the learning and training opportunities that result from the findings are of practical relevance to educators working on such workplace communication skills training programmes. Upton and Connor apply corpus linguistic methods to examine the politeness strategies used by the students in the application letters, as well as focusing on an analysis of the different parts of the application-letter-writing genre, known as an analysis of rhetorical “moves” within the written texts.

Corpora and Workplace Meetings

There is an observable prevalence of workplace meetings as data collection sites in spoken workplace corpora. For example, in CANBEC, out of the total corpus of just over one million words, meeting data account for 912,734 words. The dominance of meetings reflects the crucial role that they play as locations for speech events in everyday workplace talk. As Boden (1994, p. 81) points out, meetings are “the very social action through which institutions produce and reproduce themselves.”

There are also practical advantages to collecting corpus linguistic data in meeting settings. Meetings are often preplanned events, enabling forward planning by the fieldworker to gain permission, and to ensure that recording equipment is properly set up and that the full consent of everyone present has been obtained. Collecting data from the same type of speech event across different workplaces enables meeting language to be quantitatively compared and contrasted across different businesses and organizations. Meetings also have the advantage of enabling researchers to observe participants fulfilling often very specific role responsibilities.

However, it is important to stress that the dominance of meetings in particular workplaces is partly dependent upon the *type* of workplace, and often on the socioeconomic background of the participants who are the focus of the research project. Holmes and Stubbe (2003) point out that in their New Zealand Language in the Workplace corpus, meetings are commonplace in “white-collar” workplaces, whereas in “blue-collar” workplaces they are not so frequent (the terms “white collar” and “blue collar” refer to a historical tradition of different colours of workplace clothing depending upon occupation, thought to have originated in the United States: “blue collar” refers to those engaged in manual labour and “white collar” refers to those engaged in nonmanual work, often in offices). This point reflects the dominance thus far of white-collar and often middle-class corporate occupations in corpus linguistic workplace studies. There are exceptions, such as the New Zealand factory studies (Stubbe, 2000; Holmes & Stubbe, 2003), though the majority of these naturally occurring spoken corpora have been collected in nonmanual workplaces. One reason for this is that data recording is easier in nonmanual settings as the problems of noise can make it much more difficult to record successfully in manual environments. Additionally, actual physical workplace locations tend to be nonstatic in manual workplaces, which poses a whole suite of problems with recording equipment in such locations.

Finally, it is worth noting that the British National Corpus (BNC) includes a subset of 1.3 million words of “business events” which includes trade union meetings, along with sales demonstrations, consultations, and interviews.

Electronic Workplace Language

Nickerson (2000), and van Mulken and van de Meer (2005), provide two interesting illustrations of corpus linguistic studies of electronic workplace communication. Nickerson

(2000) took a corpus-based approach to investigating naturally occurring language in 100 e-mail messages, in English, by both native English speakers and native speakers of Dutch working for the same multinational organization at its UK base. Her corpus analysis of linguistic structures revealed that British writers used far more questions and more emphatic markers (linguistic items that emphasize the force or certainty of the message) than their Dutch counterparts.

However, Nickerson is then careful to point out that company culture plays a complex role in the communicative strategies selected, and participants' language choices should not just be viewed as representative of their national culture. Her work demonstrates the overall value of combining a corpus linguistic approach to intercultural communication with nuanced, context-sensitive analyses in order to avoid overgeneralization or cultural stereotypes.

Van Mulken and van de Meer (2005) have used corpus-based methods to conduct a genre analysis which investigates how Dutch and American organizations reply to e-mail queries regarding company products and distribution. They used corpus tools to assess linguistic differences in the response e-mails, and found that American companies express gratitude more frequently, whereas Dutch companies are more likely to use an apology when they have to decline requests.

Multimodal Corpora and the Workplace

The production of successful multimodal corpora often relies on high quality video recordings to assess speech in conjunction with paralinguistic and contextual features including posture, gesture, and gaze, and to consider how these correlate with one another. Laboratory settings are thus often needed to produce the required quality of recording. In terms of multimodal corpora of the workplace, artificially constructed settings, particularly meetings, the prevalence and significance of which was discussed above, are frequently set up as experimental data collection sites in laboratories or similar settings.

Any workplace data produced in a laboratory or constructed setting lacks the authenticity of naturally occurring workplace language, and it is important to take this into account when assessing such data and considering its applications. Some multimodal corpora will be more artificial than others—in some cases, “meeting” data will even be scripted. Nonetheless, such studies can be useful in revealing correlations between linguistic features, paralinguistic features, and the physical setting, and these findings can have clear practical relevance for workplace practitioners and trainers.

Examples of multimodal corpora where workplace-style meetings have been artificially set up include the MM4 Audio-Visual Corpus (McCowan et al., 2003). This consists of 29 meetings which cover prearranged topics where the meetings were completely scripted. There is also the Mission Survival Corpus of meetings in Italy (Mana et al., 2007). Although these are not scripted, researchers do control the topics and tasks of the meetings in experimental conditions. Similarly, the VACE Multimodal Meeting Corpus has been produced in the United States (Chen et al., 2005), where nonscripted talk takes place, but within a controlled environment, as meeting participants were given a set of specific tasks to fulfill in a set number of fixed meeting scenarios.

Conclusion

This entry has shown a range of different ways in which corpus linguistics can be used to produce investigations of language in the workplace. At the time of writing, the field is still in its early stages of development, and the range of investigations that are taking

place is exciting and innovative. Examples have been given of how the findings of such studies can be packaged to be of practical use to workers, practitioners, and trainers, thus providing examples of applied corpus linguistics workplace research in action.

Corpus Analysis of Literary Texts

MICHAELA MAHLBERG

Corpus stylistics brings together approaches from corpus linguistics and literary stylistics. It is concerned with the application of corpus methods to the analysis of literary texts by relating linguistic description with critical interpretation. Corpus stylistics as a discernible field started to develop mainly in the first decade of the 21st century. It encompasses a variety of approaches that often differ in the way that links are made between corpus linguistics and literary stylistics. This entry outlines fundamental principles underlying the corpus analysis of literary texts, and it offers an overview of the range of work that contributes to shaping the emerging field of corpus stylistics.

Literature in Corpora and Properties of Individual Texts

Literary texts can be seen in comparison to other types of texts in a large corpus. In this sense, the corpus analysis of literary texts contributes to the study of variation of linguistic features across different registers. Biber, Johansson, Leech, Conrad, and Finegan (1999), for instance, give plenty of examples of how distributions of linguistic items compare across different registers, including fiction. For corpus linguistics, frequency information is at the heart of the work in the field. Corpora provide information on repeated and typical uses, and allow for generalizations to be made across a set of texts. While linguistic features that are shared among literary texts can be easily investigated with corpus methods, features of individual texts tend to be neglected in large-scale quantitative studies. As Sinclair (2007, p. 3) puts it: "Evidence of routine behaviour of language users is found in corpora, and a distinctive literary text is just not worth including in a general corpus because it will disappear below the waves."

Corpus stylistics shifts the analytical emphasis to individual texts. Like literary stylistics, it allows us to focus on the qualities of a single text and its "artistic function" (see Leech & Short, 2007, p. 11). Linguistic features in the text are seen in relation to the effects they might create and the interpretations that readers arrive at. However, the description of the artistic function of a text is to some extent subjective and a text can have different effects on different readers. The corpus analysis of literary texts therefore has the advantage of providing more systematic evidence for interpretations (see Stubbs, 2005, p. 22). Although there are clear limitations to the quantitative information that can be derived from a single literary text, even basic corpus techniques can be of use to support stylistic analyses by automatically searching a text for specific features, displaying data in a useful format, or comparing different texts.

In his encyclopedia article on corpus approaches in stylistics, Wynne (2006) stresses the potential of the field that has come to be referred to as corpus stylistics. The main challenge lies in genuinely bringing corpus linguistics and literary stylistics together. Often, work summarized under the umbrella term of corpus stylistics is driven from a particular point of view: either corpus linguists trying to apply their methods and concepts to the study of literary texts, or stylisticians drawing on corpus linguistics to develop their approaches. In order to develop corpus stylistics as a field, we also need to be explicit about basic methodological principles that have potential for cross-disciplinary work. A useful starting point is the comparative nature of both corpus work and stylistic analysis.

Corpus Comparisons and Deviations from Linguistic Norms

Features of a particular text can be identified by comparing this text with other texts. A corpus method that highlights individual qualities of a text based on comparison is the “key words” method. A concordance tool such as WordSmith Tools (Scott, 2008) generates key words by comparing the frequencies of the words in the text with the frequencies of those words in a reference corpus. Key words are words which are significantly more frequent in the text than in the reference corpus. Scott (2006) illustrates the key words procedure by comparing *Romeo and Juliet* against a corpus containing all of Shakespeare’s plays. Culpeper (2009) also uses key words to analyze *Romeo and Juliet*, but he compares the speeches of individual characters. With the help of the tool WMatrix (see Rayson, 2008), Culpeper (2009) extends the analysis of key words to key semantic domains. For that purpose, each word is first assigned a “tag,” that is, a label, according to the semantic domain it belongs to, and the key comparison then works on the tags. Key words or key semantic domains can provide starting points for a more detailed textual analysis. The key words procedure illustrates a typical feature of corpus linguistics, which is that corpus work is to a large extent based on comparisons. The comparisons that literary stylisticians are interested in cover both comparisons across texts, and also comparisons within a text. An example of the latter is the analysis of fictional speech compared to narration in a text. Questions that stylisticians want to investigate thus have implications for the kind of corpus tools they will find useful (see Mahlberg & Smith, 2010).

In literary stylistics comparison plays a role, for instance, when stylistic features are described in terms of deviations from linguistic norms. The departure from textual norms relates to psychological effects of prominence, and to the foregrounding that affects the reader’s reception and interpretation of a text. Leech (1985) distinguishes three types of deviations. The following examples will help to characterize the different types in terms of corpus methods. “Primary deviation” is deviation from norms of the language as a whole (Leech, 1985, p. 45). It can be described by comparing a textual example to a general reference corpus. An example is the work by Louw (1993), who advocates “matching texts against corpora” (Louw, 1993, p. 161). He shows, for instance, how irony is constructed in *Small World*, a novel by David Lodge. Louw (1993) compares the context of the verb form *bent on* in a text extract with the contexts of *bent on* in a concordance. Louw’s (1993, p. 166) concordance analysis shows that “the pursuits that people are *bent on* are almost always negative or unpleasant in some way.” In the extract from *Small World*, in contrast, *bent on* is followed by the seemingly positive noun *self-improvement*. Thus Louw (1993) argues that irony is created through using an expression in a context that goes against the general trend of usage as shown in a large corpus. “Secondary deviation” is deviation from the norms of literary composition, including the norms of the author (Leech, 1985, p. 48), and an example in this area is the work of Tabata (2002). Tabata deals with 23 texts by Charles Dickens, and statistically analyzes the correspondence between word-class distributions and texts. Tabata (2002) finds that Dickens’s serial fictions and sketches are characterized by different sets of word classes. “Tertiary (or internal) deviation” is deviation from text-internal norms (Leech, 1985, p. 49). This type of deviation makes it possible to capture contrasts between different parts of a text. Stubbs (2001), replicating Youmans’s (1991) method, looks at contrasts within the short story “Eveline” from James Joyce’s *Dubliners*. He identifies places where new words are used for the first time. He finds that parts of the story identified through the analysis of vocabulary development correspond to parts of the story identified in literary criticism.

A point that has to be made about “norms” and “deviations” from norms is that the terminology seems to suggest there may be such a thing as “normal” or “ordinary” language compared to “literary” language that characterizes literary texts. Instead of making

such a distinction, Carter (2004, p. 69) favours a “cline of literariness,” with some uses of language being more literary than others. Carter (2004, p. 69) points out that the literariness of a text depends on “whether the reader (or listener) *chooses* to ‘read’ or respond to [the] text (spoken or written) in a literary way” (emphasis in the original).

Developing the Stylistician’s Toolkit

Corpus approaches add to the stylistician’s toolkit, that is, the descriptive tools that are available to characterize linguistic features. With the focus on repetitions and quantifiable patterns, a key concept in corpus linguistics is “collocation,” the repeated co-occurrence of two words within a specified span. In the novel *Bleak House* by Charles Dickens, for instance, *little* is shown to collocate with *scream*, as illustrated by Hori (2004) in his extensive study of collocations in Dickens. Hori (2004) points out that the nine occurrences of the collocation are used to delineate a character’s behavior. Miss Volumnia, a cousin of Sir Leicester’s, is the only character who utters a “little scream” (Hori 2004, p. 179). While collocations capture verbatim repetitions of words, the concept of the “semantic prosody” accounts for co-occurrence patterns around a word in terms of attitudinal meanings (Sinclair, 2004). Louw’s (1993) example of *bent on* in *Small World*, referred to above, illustrates a negative semantic prosody. The semantic prosody does not depend on the repetition of the same word, but the contexts of *bent on* shown in the concordance can be interpreted as referring to negative and unpleasant things. Patterns of co-occurrence can also be interpreted in terms of “lexical primings.” With his theory of lexical priming, Hoey (2005) suggests a psychological explanation for the existence of collocations: Language users acquire collocations by being exposed to repeated patterns of usage. Lexical primings are described on the basis of patterns in corpora. By showing how writers deviate from common language patterns, Hoey (2007) also uses his theory of lexical priming to account for literary creativity. With a method similar to that of Louw (1993), Hoey (2007) compares fragments from literary texts against reference corpora. He looks, for instance, at the beginning of a fantasy novel by Michael Moorcock, and relates the meanings of *called for* and *went to them* in the text extract with the meanings of these forms in reference corpora. Hoey (2007) argues that Moorcock exploits the readers’ primings to create a contrast between how characters are portrayed and how characters act.

When corpus approaches are applied to the analysis of literary texts, the focus is often on the innovation brought about by the methods or descriptive tools. It is equally important to explicitly link these methods and tools to approaches in literary stylistics. Semantic prosodies, for instance, can be interpreted in terms of point of view (Adolphs & Carter, 2002), key words can be linked to style markers (Culpeper, 2009), key semantic domains can be used to identify metaphorical language (Archer, Culpeper, & Rayson, 2009), and the analysis of collocations can be interpreted in terms of schema theory in order to build a link to cognitive stylistics (O’Halloran, 2007). In addition to building links from corpus methods to concepts in literary stylistics, we also need to proceed in the other direction: driving corpus approaches by research questions in literary stylistics. A book-length contribution in this area is the approach by Semino and Short (2004). The authors set out to test and develop the Leech and Short ([1981] 2007) model of speech and thought presentation. This model originally focused on prose fiction. With the help of a corpus approach, Semino and Short (2004) show how an extended version of the model can be systematically applied to compare twentieth-century fictional, journalistic, and (auto)biographical narratives. The study is based on a corpus that had to be annotated manually to identify categories of the discourse presentation scales, such as direct thought or free indirect speech. This work shows that corpus stylistics is not the same as a merely quantitative approach to

stylistic questions. Semino and Short (2004, p. 40) emphasize that the process of annotation is in itself part of the analysis and theory development: "the re-examination of the corpus data in the light of the completed annotation . . . can lead to further changes in theorization." Busse (2010) further develops the Leech and Short ([1981] 2007) model with a focus on 19th-century English.

Another corpus stylistic approach that is motivated by theoretical questions is Toolan's (2009) narrative prospection model. Toolan (2009) is interested in parameters that shape readers' expectations as to how a text progresses. To identify features that foreground narrativity, he employs corpus methods such as key word comparisons or searches for repetition patterns. His focus is on specific features that are singled out on the basis of textlinguistic and narratological theory. Corpus methods then aid the semiautomatic search for the features in question. Among the narrativity parameters are sentences containing high-frequency key-word character names, or sentences carrying characters' represented thought. In the discussion of the latter, Toolan (2009, pp.137f.) suggests an inductive procedure to automatically identify examples of free indirect thought, thus suggesting a way towards automatizing some of the annotation that for the Semino and Short (2004) study still had to be done manually.

Searching for a Theoretical Underpinning of Corpus Stylistics

Altogether a number of different approaches may be grouped under the umbrella of the newly emerging field of corpus stylistics. Some of them tend to be located more towards the corpus linguistic end of the spectrum, with a focus on methods, while others give more emphasis to questions originating in the realm of literary stylistics. Although Semino and Short (2004) begin their study with the speech and thought presentation model that was developed in the field of literary stylistics, their book also addresses wider implications for a cross-disciplinary field of study. The authors emphasize that one of their aims is to make stylisticians and corpus linguists more aware of each other's work (Semino & Short, 2004, p. 17). Such mutual awareness is crucial in order to arrive at an approach that is more than the sum of its parts. Nevertheless, identifying a theoretical basis for corpus stylistics cannot be straightforward. Neither corpus linguistics nor literary stylistics are unified fields. On the one hand, corpus linguistics can be seen as a methodology that is applicable across a range of linguistic fields to support the quantification of linguistic analysis. On the other hand, the description of repetitions that become visible through the cumulative picture provided by corpora has led to new descriptive concepts such as collocations, semantic prosodies, patterns, lexical bundles, or lexical primings that raise theoretical questions (see, e.g., the arguments in Biber, 2006; Hoey, 2005; and Sinclair, 2004). The underlying view of corpus linguistics will then naturally shape the approach taken to corpus stylistics. In his corpus stylistic approach to narrative progression, Toolan (2009, p. 24) states that for him, "corpus analytic methods are only the tail, while one's theory of language . . . remains the dog." This view leads him to describe his study as being "based in corpus linguistic methods but in fact driven by textlinguistic and narratological theory" (Toolan, 2009, p. 25). Equally, literary stylistics can be approached from different angles to which both linguistics and literary criticism contribute. Ideally, a corpus stylistic approach is guided by the starting point that lies with the text under analysis, and combines various fields that are relevant to the textual analysis.

A theoretical foundation for corpus stylistics can be based on the concept of the "corpus stylistic circle" (see Mahlberg, in press). The corpus stylistic circle builds on the view of stylistics as presented by Leech and Short ([1981] 2007). According to Leech and Short ([1981] 2007, p. 11), literary stylistics aims "to . . . relate the critic's concern of aesthetic

appreciation with the linguist's concern of linguistic description." To explain this relationship, Leech and Short ([1981] 2007, p. 12) draw on Spitzer's (1948) philological circle: Linguistic observation and literary insight, including interpretation and critical evaluation, are in cyclic motion. Neither of the two has priority, because the human analyst will always approach a text as both an example of language and also as a literary work. On this basis, the aim of corpus stylistics can be seen as relating the critic's concern of aesthetic appreciation with the corpus linguist's concern of linguistic description. At first sight, this statement may seem to be a simple reformulation of the one put forward by Leech and Short ([1981] 2007). However, the "corpus linguist's concern of linguistic description" emphasizes that corpus linguistics has started to change the way in which we observe and describe language.

The corpus stylistic circle is exemplified by Mahlberg's (in press) study of Dickens's fiction. Mahlberg (in press) draws on the concept of local textual functions as descriptive tools from a corpus linguistic point of view. Local textual functions aim to capture lexical patterns that are specific to a set of lexical items or a set of texts. In this sense the functions are local. The functions are textual, because they aim to describe how the items function in view of the qualities of the text(s) they occur in (see Mahlberg, 2007). The starting point to find local textual functions in Dickens is the identification of clusters. Clusters are repeated sequences of words such as *his hands in his pockets* or *as if he had been*. Mahlberg (in press) argues that such clusters function as building blocks for textual worlds in Dickens's fiction. They contribute, for instance, to the description of characters, or point to comments by the narrator. The corpus stylistic circle highlights the relationship between linguistic description and the concerns of the literary critic. This relationship is captured by linking the description of building blocks of textual worlds to an approach to the externalization of characters put forward by John (2001). While Mahlberg's approach to Dickens's fiction contributes to the conceptualization of a foundation for corpus stylistics, it also points out unavoidable limitations of the field. The localness of the functions under analysis emphasizes that not every text will be amenable to a similar analysis. Equally, not every author may be as prolific as Dickens and thus allow for generalizations across a number of texts that can then form the background for the analysis of a specific text sample (see Mahlberg, 2009). Corpus linguistics depends to some extent on a critical mass for the identification of patterns, which is reflected by the fact that much of corpus stylistic work focuses on prose fiction, or the style of an author as shown in a number of his/her works (e.g., Hardy, 2007; Fischer-Starcke, 2010).

Conclusions

The theoretical underpinning of corpus stylistics is directly related to its applied nature. With the focus on individual texts, corpus stylistics addresses the real-world problem of how texts have effects on readers, and how texts are part of a culture where people respond to a text as a work of literature. By addressing this real-world problem, corpus stylistics also highlights the limitations of corpus linguistics. Texts in corpora are not "read," and corpora do not offer a straightforward way of assessing the effects of texts on readers. Corpus methodology can help to find repeated patterns. Such patterns can contribute to the foregrounding which is "assumed to be a fundamental sense-making aesthetic resource" (Toolan, 2009, p. 71). However, identifying repetition is not the same as explaining possible effects a text may have on a reader. As Toolan (2009, p. 191) highlights, "it is not that textual obviousness alone is sufficient condition for something to be likely to be psychologically real for readers." With the focus on discernible patterns in texts, corpus stylistics can be of use in complementing literary stylistics and literary criticism, but it cannot claim to replace either of them.

Future developments in corpus stylistics will have to explore a variety of corpus resources, both in terms of software and corpora, in order to relate textual patterns to a range of literature-specific questions. The analysis of corpora containing translations of literary texts, book reviews, and scholarly criticism can add further dimensions to the study of literary texts and their potential effects on readers. Additionally, working notes by authors may provide useful resources for innovative corpus studies.

Corpus Analysis of Political Language

ALAN PARTINGTON

Types of Corpus-Assisted Studies Into the Language of Politics

It is difficult to conceive of any political action which does not involve using language: political speeches, newspaper editorials, press conferences, Acts of Parliament, declarations of war and peace negotiations, to name but a few. Language is vital to the process of transforming political will and power into social governance and all political actions are prepared, accompanied, and controlled by language. Fairclough goes further still. Politics, he says, is not just conducted through language, but much of politics *is* language: “politics partly consists in the disputes which occur in language and over language” (Fairclough, 1989, p. 23).

It is possible to define politics narrowly as the working of institutions of power or, more broadly, as the interrelations of groups (including those institutions) within a given society. It is similarly possible to define the *language* of politics narrowly as the language used by an institution to conduct its business, to communicate with other institutions and to the rest of society, or, more broadly, as all the discourse produced by groups within a society which relate to issues of the management of power and of social governance. Both of these definitions are relevant to the kind of studies of political language conducted with the assistance of corpora.

One type of study relates to the first definition and examines the language of a particular institution, employing corpus-assisted techniques to examine the linguistic structures used by actors to effect the business of the institution and to communicate politically relevant messages to addressees and beneficiaries (the parties for whom the discourse is ultimately enacted) in order to fulfill the specific functions of the institution or particular aims of the actors.

Another type of study examines texts on political issues emanating from the main sites of public experience of political issues, namely the media, both printed and spoken.

Potential Sources of Data

In both types of study, researchers will typically need to compile their own data set, very generally by downloading texts from the Internet, rather than exclusively accessing large preexisting so-called “general language” corpora such as the Bank of English or the British National Corpus. A number of political institutions make available a good number and variety of political texts, for example, the White House Library, the UK government Web site and the Web sites of individual political parties. Several countries make available transcripts of their parliamentary discussions, though this raises the vexed question of authenticity. UK Hansard reports, for example, are frequently altered after the actual speeches have been delivered (Mollin, 2007).

Media texts too can often be found on the Internet; those provided by newspapers, of course, but media networks like the BBC, CNN, and US public service radio, for instance, often provide transcripts of speeches, debates, and interviews. In some cases, however, as

generally with TV news, transcripts may well have to be prepared manually by the researchers. When accessing data owned by private media companies, researchers have to take care not to infringe copyright.

Depending on the research questions, the researchers may decide to annotate their corpora in some way. As with any information that has been transferred from one format to another (a photograph is not the same as its subject), data which has been downloaded into a computer-readable form has undergone a process of decontextualization, of “semiotic impoverishment” (Hardt-Mautner, 1995), which can sometimes be quite severe. It may therefore be appropriate to reenact access to contextual information, for example, which section of a newspaper an article appeared in or, in an interactive discourse type, information about the various speakers. Such information can be added to the corpus while keeping it separate from the actual text it contains, the process being commonly referred to as mark-up. A good example of how mark-up can permit a fine-grained analysis of different linguistic contexts and different speakers can be found in the body of work on parliamentary discourse, much of which has been comparative, contrasting the different language practices of different kinds of speakers, on the basis of gender, party affiliation, and institutional role (Bayley, 2004; Bevitori, 2007).

The comparative ease with which sizeable data sets can be collected has spawned a generation of researchers who use corpora as one of their research tools, “linguists who use corpora” rather than “corpus linguists.” Moreover, it is not only linguists who compile and use their own corpora. Almost all the language-based sciences—philosophy, literary studies, psychology, sociology, and, of course, political science—can boast researchers who work with corpora. However, corpus use can encourage even non-linguists to look at and evaluate the language patterns the subject matter is expressed in. The studies outlined here are then conducted by “linguists who use corpora” working, on occasion, with “political scientists who use corpora.”

Types of Research Objectives

There are also at least two distinct types of research objective. The first type is similar in its aims to discourse and conversation analysis and uses corpus techniques to investigate a particular political or institutional discourse type, exactly as with any exemplar of discourse, to uncover and analyze non-obvious patterns of language or aspects of linguistic interaction. Partington’s study (2003) is an attempt to devise corpus-assisted discourse studies (CADS) methodologies to investigate the communicative strategies used by speakers in a particular form of institutional conflict talk between politicians and journalists, and treats issues of general linguistic interest such as facework, participation roles, attribution, and metaphor. Other corpus-assisted studies of (im)politeness in press briefings and judicial inquiries have shown how participants in institutional settings operate with not just one set of positive face needs, but two, namely, competence face and affective face. The former is bolstered by appearing to be competent, authoritative, and in control whilst the latter is enhanced by persuading our peers that we are, first of all, non-threatening, but also congenial and good to be around. The problem is that, since affective face is closely related to belonging to an in-group, the two forms of face are generally incompatible at any one time. Different participants can be seen to give different weight to the two types and adopt different strategies in maintaining them (Partington, 2006, pp. 97–8, 169–70; Taylor, 2009).

The second type of research is more overtly engaged with the political, social, and cultural aspects of the set of texts under study and attempts to uncover any non-obvious

ideological meanings and messages they may contain. Teubert (2001) has studied the language of Euroskepticism in the UK employing a corpus of texts deriving from various self-proclaimed Euroskeptical Web sites whilst Hardt-Mautner's (1995) seminal paper on combining qualitative and quantitative approaches in CADS research was in fact a metastudy born from a methodological need to analyze large quantities of texts on EC/EU discourse in the UK press. Several authors have studied patterns of language in an individual politician's public addresses or those of a political party (Fairclough, 2000) with the aim of shedding light on ideological positions and how they are communicated.

This second type of project is, naturally, more typical when corpora of media discourse are being employed, whether the object of scrutiny be the ideology of media organs themselves or the ways in which they discuss ideological issues. Johnson, Culpeper, and Suhr's study (2003), for instance, is a diachronic study of the varied and changing ways in which PC terms (*politically correct*, *political correctness*, etc.) were employed in three corpora of different UK quality newspapers from 1994–9, particularly in reference to how Labour Party policies were perceived.

Occasionally the two types of research objective—the linguistic and the ideological—are combined. Baker et al.'s research (2008) is the result of an interdisciplinary collaboration between a group whose primary training was in corpus linguistics and a group of critical discourse analysts (CDA), a subdiscipline whose practitioners traditionally and explicitly work within a leftist ideological framework. The research analyzed a 140-million-word corpus of British news articles about refugees, asylum seekers, immigrants, and migrants (collectively RASIM). It tested how collocation and concordance analysis were able to identify common categories of representation of RASIM, as well as directing analysts to representative texts in order to carry out more detailed qualitative analysis. Interestingly, the two groups obtained different observations. The corpus linguists, working with the whole corpus, uncovered both positive and negative representations of RASIM, whilst the CDA group, focusing on a smaller group of articles, concluded that positive representations were non-existent.

Another project with a still wider interdisciplinary scope was the European Union-funded *IntUne* project (2005–9), where teams of corpus linguists from France, Italy, Poland, and the UK collaborated with teams of scholars and political practitioners from a large number of EU countries and from political science, sociology, public policy, media, linguistics, and socio-psychology. The aim of the project was to study the changes in perceptions of citizenship, particularly in terms of identity, representation, and scope of governance, which result from the enlargement of the European Union.

The corpus linguists compiled and marked up two corpora of television and newspaper texts from the four countries, the first from February to March 2007, the second from the same three-month period in 2009, and analyzed them to track any perceived changes in media attitudes to European affairs. Topics studied included how the press in different countries reported the EU's 50th anniversary, how they report the politics and customs of other member states, and whether there is any historical evidence in the press of a common sense of European identity. It must be noted that a good number of political scientists involved in the collaboration failed to appreciate the relevance of collecting and analyzing preexisting data on issues such as perceived sense of European identity or attitudes to enlargement and immigration, preferring either to elicit their own data, generally in the form of questionnaires, or preferring frequently to trust their own introspections. This lack of appreciation of corpus-driven research is not dissimilar to that once commonly experienced by corpus linguists within linguistics itself.

The Added Value of Using Corpora

There have of course been a large number of studies of language in politics conducted by linguists, mainly discourse analysts, or by political scientists, without any recourse to corpus techniques. These have traditionally been qualitative in nature concentrating on a limited number of texts. However, it is clear that, in politics as much as any other field, an individual text does not exist in isolation from other texts of the same institutional discourse type, whether it be a parliamentary speech or even a session of speeches, or a newspaper article commenting, say, on immigration policy. Both the speech and the article are inevitably part of a much wider ongoing discourse. Large collections of tokens of a discourse type would seem to be a valid, appropriate, and rigorous way of reflecting the intertextuality of political discourses. As Sinclair commented: “the language looks rather different when you look at a lot of it at once” (Sinclair, 1991, pp. 100), and the same is true of any individual discourse type of the language.

The *CorDis* project (Morley & Bayley, 2009) was entirely premised on the validity of intertextuality, of the interconnectedness of discourse types. *CorDis* is a composite corpus or, alternatively, a collection of subcorpora of around 6 million words of transcribed spoken (ca. 4.5 million) and written (ca. 1.5 million) texts from UK and US sources of varying types but all relating to the post-2003 conflict in Iraq. It was devised to reflect the temporal progression from political news making to reporting and investigation:

- Sources of news creation: (a) British House of Commons, (b) US House of Representatives;
- News negotiating and mediation: White House press briefings;
- Recounting to the public: (a) television news, (b) newspapers, subdivided into news reports, editorials, and opinion pieces;
- Political-judicial inquiry: the Hutton Inquiry, which touched on the UK Government’s reasons for going to war.

The corpus was marked up to permit both the isolation of parts of a single subcorpus, for instance, type of speaker (female or male, Democrat or Republican, White House podium or journalist), as well the ad hoc creation, if necessary, of a large number of different groupings of texts in order to answer specific research questions. These groupings could cut into and across subcorpora—i.e., all the editorials and opinion pieces, but not news reports, from US, but not UK—newspapers (Morley, 2009). The television news subcorpus was marked up for speaker role (e.g., news presenter, war zone correspondent, ordinary person), speech event (e.g., news report, live exchange, reporter question) and mode of delivery (e.g., spoken to camera, in voiceover, in videophone) (Marchi & Venuti, 2009). It was possible to interrogate all of the subcorpora in turn in relation to a particular theme. Duguid (2009), for instance, investigates the different proportions and functions of reporting devices (from verbs such as *claimed*, *asked*, to text nouns like *dossier*, *report*, to thought signals such as *felt*, *wondered*) in each of the subcorpora respectively, in particular the way these devices are managed and exploited by institutional speakers.

Corpora and corpus techniques, then, permit the integration of quantitative analyses with those of a qualitative nature and this permits radically different types of research. CADS methodology

is predicated on the belief that the combined use of qualitative and quantitative linguistic analysis is not only possible but that their combined application increases the researcher’s analytical capacity to an extent greater than would be predicted from the sum of the two methods. (Morley, 2009, p. 10)

At the very simplest, corpus techniques can collect instances of use of items of interest to the researcher quickly and exhaustively. Hardt-Mautner (1995) was interested in how the four UK newspapers in her material, that is, two tabloids, the *Mirror* and the *Sun*, and two so-called qualities, the *Guardian* and the *Telegraph* (the first in each pairing being left-leaning, the second right-leaning), evaluated EC/EU news actors. The precise example she discusses is that of Jacques Delors, then president of the EU Commission. Using a concordancer, a program which searches very rapidly through large quantities of text and lists all instances of the search word or phrase along with a specifiable amount of context, she collected all instances where Mr Delors was mentioned. She was then able to go into the texts themselves and analyze in a traditionally qualitative fashion how he was discussed (much more frequently and, unsurprisingly, more negatively in the right-leaning Euroskeptical papers).

Typically in CADS research, however, a qualitative analysis can provide observations which themselves serendipitously suggest avenues of further quantitative and qualitative investigation. Hardt-Mautner (1995) prepared word-frequency lists—lists containing the words in order of frequency of occurrence—from her four newspapers. High in the lists of the two tabloids she found the names of the newspapers themselves, as well as the item *people*. Using the concordancer to investigate the use of these words in context she ascertained that the tabloids not only used self-referentiality as a means to create an authoritative voice for themselves, but even went so far as to claim to speak for the *people*.

Duguid's detailed investigation of reporting items mentioned above was largely sparked by her observation of their incidence in word-frequency lists of the various *CorDis* sub-corpora. Riccio (2009) was intrigued by how the item *message* was high in the frequency list of White House briefings. Her subsequent detailed qualitative analysis of the item at both grammatical and rhetorical levels revealed the very varied and subtle ways it was employed by the spokespersons, sometimes to warn or even threaten some beneficiary of the *message*.

It is often very fruitful to compare the word-frequency lists obtained from two separate collections of texts, which can reveal which particular words or word clusters (i.e., "groups of words which follow each other in a text" [Scott, 2008]) are more frequent and often therefore more relevant in the one as opposed to the other. These items are known as the key words or key clusters of the relevant corpus. In Baker's analyses of two political debates, one on foxhunting in the UK House of Commons (Baker, 2006, pp. 121–49) and one around a Bill in the House of Lords to equalize the age of sexual consent for gay men with that for heterosexuals (Baker, 2004), he compares the word-frequency lists of the pro- and anti-sets of speakers. As regards the second of these, he notes how the word *homosexual* was associated with the key word *acts*, whereas *gay* was linked to key words denoting identities. Those who argued in favor of law reform focused on a discourse of equality and tolerance, while those who were against law reform tended to employ key words relating to danger, ill health, crime, and unnatural behavior.

It is impossible to overstate the importance of comparison in all CADS research; it is only possible to ascertain the particular features of one discourse type by comparing it with others. It is common practice to determine the key items in one's target corpus by comparing its frequency list with that of a heterogeneric general language corpus. Baker compared both his House of Commons pro- and anti-foxhunting speeches to the FLOB (Freiberg-Lancaster/Oslo Bergen) heterogeneric corpus. The item *cruelty* was frequent in both sides of the debate and therefore did not appear as a key word when they were compared, but it did appear in the key word comparisons with FLOB. Subsequent concordancing of the word revealed how each side in the debate used the term in very different ways. In the anti-hunt discourse it appeared with items such as *ban*, *prevent*, *tackle*,

unnecessary, root out, thus taking for granted that hunting entailed cruelty. But in the pro-hunt discourse it appeared with words and phrases relating to the difficulty of *defining* cruelty, of devising *tests*, to *prove*, or find *evidence* that hunts involved cruelty (Baker, 2006, pp. 138–9).

Modern Diachronic Corpus-Assisted Discourse Studies (MD-CADS)

One very recent offshoot of CADS, namely modern diachronic corpus-assisted discourse studies (MD-CADS; see Partington, 2010, for the first collection of papers), is entirely premised upon comparison. Researchers at the Universities of Siena and Bologna in Italy compiled the *SiBol* Corpus consisting of two (sub)corpora from different but contemporary periods in time, designed and compiled to be as alike as possible to eliminate potential maverick variables. The first, *SiBol 93*, contains all the articles published by the three main UK quality newspapers, namely *The Times*, the *Telegraph*, and the *Guardian*, in the year 1993. The second, *SiBol 05*, contains articles which appeared in the same three newspapers in the year 2005. The first contains around 100 million words and the second around 145 million words. Articles in the two corpora were marked up to permit the retrieval of metalinguistic information about the different political orientation of the three newspapers, date, and specific source.

The word-frequency lists of the two corpora were compared with each other, producing two key word lists, one of the key items in the 2005 newspapers, the other of the key items from 1993. Apart from allowing the researchers to track changes over time in newspaper language and discourse practices, the lists shed much light on political, social, and cultural developments over the time period. Clearly news actors come and go: for instance, the 2005 list contains *Bush* as opposed to *Clinton* and *Blair* as opposed to *Major*, and similarly items relating to current newsworthy events, Iraq- and Afghanistan-related items as opposed to Bosnia-related terms.

The 2005 key word list includes items relating to high finance or venture capitalism, including *FTSE* (Financial Times Stock Exchange index), *bid*, *takeover*, *executive*, and *hedge* (funds), as well as financial institutions such as *Deutsche* and *HSBC* (both banks).

In contrast, the 1993 key word list contains few items from high finance and far more relating to the national economy in general: *recession*, *recovery*, *inflation*, *economy*; to the relationship of government to the economy: *treasury*, *devaluation*, *privatization*, *budget*, *trade union(s)*; and to industrial matters: *coal*, *chairman*, *industrial*, *unemployment*. Commerce and trade feature prominently: *trade*, *market*, *profits*, *losses*, and both *export* and *exports*, as very significantly do items relating to war and “defense”: *UN*, *defense*, *NATO*, *military*, *troops*, *peacekeeping*, (armed) *forces*, *commander*, *artillery*, (arms) *embargo*, *convoys*, and *war*. This should not imply that the world in 2005 had necessarily become more peaceful and, unsurprisingly, in the 2005 list there are a number of terrorism-related words: *bombing(s)*, *terrorist*, *terror*, and *Qaeda*. The greater quantity of lexis on economic and military matters in the 1993 list may simply reflect the general growth in UK “quality” newspapers of soft news and magazine content relative to hard news and political reporting over the time period.

Conclusion

By enabling quantitative and qualitative research methodology to be used in tandem, corpus-assisted approaches have considerably deepened our understanding of the character of political language, both from the linguistic and political scientific perspectives. At

the same time, the particular challenges presented by research into political discourse types, given their multi-faceted, ever-changing, and often conflictual nature, has led researchers to forge novel methodological techniques which can fruitfully be applied in other areas of corpus research.

Corpus Analysis of Scientific and Medical Writing Across Time

DWIGHT ATKINSON AND ELLEN VALLE

Diachronic corpus linguistic studies have fundamentally deepened our knowledge of scientific and medical writing by revealing “language-in-the-making” (see Latour, 1988): how the literate technologies of scientific and medical research have developed, and what they have been developed for. If language actively creates (rather than simply reflects) the realities it describes, as constructivist accounts of language and social life (e.g., Kress, 1995) argue, then to study the history of scientific and medical language is to study, in part, the history of science and medicine itself.

Diachronic Corpora Featuring Scientific and Medical Writing

The diachronic study of scientific and medical writing is a comparatively recent development in corpus linguistics, and has therefore focused largely on corpus-building. For this reason, we begin by reviewing existing corpora.

It should first be noted that virtually all computerized historical corpora featuring scientific and medical language are English-language corpora. While unfortunate from the viewpoint of linguistic diversity and representativeness, this no doubt also reflects the expanding historical role of English in science and medicine. Thus, comparing journal abstracting databases between 1965 and 1988, Baldauf (2001) found a 10% increase for English over other languages in biology articles, to 84.7%, a 16% increase for chemistry articles, to 66.9%, and a 24% increase for medical articles, to 75.6%. These trends have no doubt continued apace in most cases.

Corpora featuring scientific and medical writing can be divided into two types. *General corpora* seek to cover a wide range of fields and text types; they are usually designed to provide the basis for general descriptions of a language. *Specialized corpora*, on the other hand, focus on specific areas of endeavor, such as science, medicine, law, and literature. Both types of corpora have their uses in cross-time studies of scientific and medical writing.

General corpora featuring scientific and medical writing include the 1.5-million-word diachronic section of the Helsinki Corpus of English Texts (<http://www.helsinki.fi/varieng/CoRD/corpora/HelsinkiCorpus/index.html>), the original computerized historical corpus of English, which covers the period AD 750 to 1700. The Helsinki Corpus’s representation of scientific and medical writing is modest, amounting to no more than three scientific texts and two medical texts (and sometimes none) per 100-year period. Overall, the corpus contains ten texts classified as scientific, four as medical, and four as combined scientific/medical. Individual texts are 2,000–10,000-word extracts from full texts.

A second general corpus featuring scientific and medical writing is the Representative Corpus of Historical English Registers, or ARCHER (<http://www.llc.manchester.ac.uk/research/projects/archer/>), originally compiled by Douglas Biber and Edward Finegan at the University of Southern California (Biber, Finegan, & Atkinson, 1994) and now managed by a consortium led by David Denison and Nuria Yañez-Bouza at the University of Manchester. As of 2010, ARCHER contains 1.8 million words comprising 2,000-word

samples from 11 historical registers (i.e., situational varieties) of English, two of which are scientific and medical research writing samples from historical journals across approximately 50-year periods from 1650 to 1999. There are 100 scientific and 126 medical texts in total.

Specialized corpora of scientific and medical writing include the Middle English Medical Texts (MEMT; <http://www.helsinki.fi/varieng/CoRD/corpora/CEEM/MEMTindex.html>) corpus constructed by Irma Taavitsainen, Päivi Pahta, and Martti Mäkinen at the University of Helsinki (Taavitsainen, Pahta, Mäkinen, & Hickey, 2005). MEMT is a 500,000-word corpus consisting of 200- to 2,000-word samples of 83 texts on medical matters from 1375 to 1500. The texts are divided into three groups—surgical treatises, specialized texts, and remedy books—written for both medical practitioners and the wider public. MEMT is part of the larger Early English Medical Writing corpus project (Taavitsainen & Pahta, 1997; Taavitsainen, 2009), which will cover 1375 to 1800. The Early Modern section of this corpus, spanning 1500 to 1750 and about to appear as of 2010, has been the subject of several studies (see below).

A second specialized corpus, the Coruña Corpus of English Scientific Writing (www.udc.es/dep/finc/CC.doc), is currently being compiled (as of 2010) at the University of A Coruña, Spain by the Research Group for Multidimensional Corpus-based Studies in English (Crespo Garcia & Moskowich-Spiegel Fandino, 2010). When complete, the Coruña Corpus will consist of English scientific texts from 1700 to 1900, although “science” is interpreted broadly to mean natural sciences, humanities, philosophy, and history. Each of these categories will consist of two text samples per 10-year period, with texts running up to 10,000 words. The natural science section will include texts in astronomy, physics, life sciences, chemistry, mathematics, and possibly other areas. The astronomy texts have already been released as the 400,000-word Corpus of English Texts on Astronomy (Crespo Garcia & Moskowich-Spiegel Fandino, 2009).

A final historical corpus of scientific writing, also currently under construction (as of 2010), deserves special mention: the diachronic section of the Corpus Informatisés Bilingues de Langues de Spécialités (www.termplus.dk/docs/LANS22003-CIBLSP.doc), being compiled at the University Lumière Lyon 2 under Philippe Thoiron. This appears to be the first effort to construct a bilingual diachronic computerized corpus of scientific writing, in this case focusing specifically on the field of ecology. Dury (2004) described the challenges in compiling this corpus, the English part of which runs from 1900 to 2002 and features (apparently complete) “specialized and semi-specialized” (p. 9) articles and book chapters on ecology, sampled by 10-year period. This part of the corpus, totalling about 700,000 words, is complete; its French counterpart is under construction.

Diachronic Corpus Studies of Scientific and Medical Writing

The studies described in this section are based on the corpora reviewed above. As most of the specialized corpora, in particular, are currently (2010) under construction, the research conducted on them is preliminary.

As part of a larger project, Atkinson (1992) analyzed a portion of ARCHER’s medical subcorpus—70 articles from the *Edinburgh Medical Journal* (EMJ) sampled across seven 40–50-year intervals between 1735 and 1985, with a total of approximately 250,000 words. The analysis employed Biber’s (1988) multidimensional approach, which measures frequency changes in 67 linguistic features, grouped via factor analysis into five smaller sets of co-occurring features, with each set given a descriptive label based on its features’ shared functions.

Over the 250-year period of study, *EMJ* articles showed: (a) a steady increase in “informational production,” as marked by rising frequencies of nouns, word length, prepositions, high type/token ratios, and attributive adjectives; (b) a steady drop in narrative features (e.g., past tense verbs, third-person personal pronouns, and “public” verbs); (c) steady linear movement from “situation-dependent reference” to “explicit reference,” the latter marked by relative clause types and nominalizations; (d) a steady drop (with one exception) in “overt expression of persuasion,” as marked especially by modals; and (e) no appreciable movement from an “abstract” presentation of information, as represented by passive verb types and reduced relative clauses.

Atkinson (1996, 1999) applied the same methods to a modified version of the original ARCHER scientific subcorpus—70 articles from the *Philosophical Transactions of the Royal Society of London* (*PTRS*), sampled at seven 50-year intervals between 1675 and 1975. Like the *EMJ* texts, *PTRS* articles showed steady increases in “informational production,” a steady drop in narrative features, and a general trend toward less “overt expression of persuasion.” Unlike the medical texts, there was general movement over the 300-year period toward more “abstract” information presentation, but no clear pattern of variation on “explicit” versus “situation-dependent reference.”

While different forces were obviously at work in British science and medicine, common trends existed as well. Thus, both of Atkinson’s studies indicate movement from relatively narrative, personal approaches in early periods to increasingly non-narrative, impersonal ones. Thus, the main rhetorical basis for truth claims in both fields shifted from personal authority and detailed eye-witness description of actual events to (a) intricate descriptions of research methods in 19th-century science, and (b) generalizations based on large statistical data sets in 20th-century medicine. Texts also became increasingly nominalized and informationally dense as the highly distinctive registers of present-day scientific and medical research writing emerged.

Biber has conducted multiple studies comparing cross-time development of different written registers of English. While not focusing exclusively on medical or scientific texts, these studies provide interesting comparative data. Thus, Biber (2004) examined the use of five types of stance markers (i.e., markers of propositional attitude or feeling such as *might*, *hopefully*, *appear to*) in drama, personal letters, news, and medical research registers from the ARCHER corpus between 1650 and 1975. While stance markers generally increased in frequency across registers in this period, medical research articles exhibited little change on four of the stance marker types, and in all but one case showed the lowest cross-time frequencies of stance markers among the four registers. These findings reinforce what both other studies and commonsense experience suggest: that present-day English-language research writing represents a truly distinctive form of language use—one which has increasingly diverged from other uses of language.

In a series of studies based on the Middle English Medical Texts Corpus, Taavitsainen and colleagues (e.g., Taavitsainen & Pahta, 1998) established the existence of a scholastic philosophy approach to argumentation wherein rhetorical appeals were made to ancient and medieval authorities. This was thought to be opposed to a natural-philosophy (i.e., early modern science) approach based on personal observation and experience. Taavitsainen (2009) extended this research by analyzing six kinds of texts represented in the not-yet-released Early Modern Medical Texts Corpus—general treatises (textbooks), specialized treatises, surgical treatises, recipe books, health guides, and medically focused *PTRS* articles—for evidence of both kinds of rhetoric. Although the findings were complex, at least one clear pattern emerged: *PTRS* articles were resolutely geared toward appeals to personal experience and observation, following the new approach to science innovated in the 17th century, whereas the other genres were variable in this regard.

In early work on the Coruña Corpus, Lareo and Ramos (2008) examined the frequency and use of complex predicates (CPs) containing the verb *make* in the 18th-century portion of the life sciences subcorpus, totaling 10 texts and approximately 100,000 words. They found that higher frequencies of *make*-CPs correlated with one extralinguistic variable, *origin of author*, while lower frequencies correlated with *level of technicality of text* (specialized versus popular). In general, *make*-CPs increased over the 100-year period of study. It should be noted, however, that frequency differences were quite small in this study, with the total range of variation amounting to just over one occurrence per 1,000 words of text.

Reyes (2008) examined verb types in 19 mathematical texts from the Coruña Corpus between 1800 and 1900 (as mentioned previously, the Coruña Corpus includes mathematics in the natural sciences). She found that verbs of communication (e.g., *say*, *tell*) and perception (e.g., *see*, *observe*) were more common in these texts than desiderative verbs (e.g., *want*, *wish*), as were verbs in the simple present tense and passive voice. These findings agree, according to Reyes, with heightened attention to clarity, precision, directness, impersonality, and nominalization in modern mathematical writing as part of a more general emphasis, rhetorically speaking, on scientific observation and objectivity.

Additional Studies and Future Directions

Additional studies inform the diachronic study of scientific and medical writing. Moessner (2009), for instance, compared two small corpora of scientific texts—one drawn from ARCHER—to test the degree to which ARCHER represents the full range of 17th-century English scientific writing. On the basis of her findings, she argued that ARCHER was representative in some ways but not in others. While representativeness is an ideal concept in diachronic corpus construction, and there is no real way to ascertain it without compiling a corpus of all texts, Moessner does provide useful ideas for future corpus construction.

There are various cross-time studies of scientific and medical writing based on nonelectronic (and not publicly available) text collections—notable examples include Bazerman (1988), Gross, Harmon, and Reidy (2002), Salager-Meyer, Alcaraz Ariza, and Pabón (2007), and Valle (1999). Much can be learned from these studies about the historical development of scientific and medical writing—knowledge which can be applied and/or tested in diachronic corpus research. Attempts have also been made to combine qualitative and quantitative research methods in this endeavor, including Atkinson's studies reviewed above.

Conclusion

Diachronic corpus linguistic research on scientific and medical writing is in its infancy: existing corpora provide quite partial coverage; most specialized corpora are still under construction; there is a near-complete bias toward English, although this bias is not completely unmotivated from a present-day perspective; and only a small number of studies, many of them self-admittedly preliminary, have been completed. We can therefore hope for extensive development in this area in coming years, as new corpora come online and researchers extensively analyze them.

Corpus Analysis of Sign Languages

TREVOR JOHNSTON AND ADAM SCHEMBRI

Introduction

Sign languages (SLs) are the naturally evolved visual-gestural languages of deaf communities. There are many SLs, many of which are not mutually intelligible or historically related. A few of these languages are village-based (e.g., in the less urbanized and developed regions of the world) but most are urban-based and have strong historical links to schools for the deaf established between the 18th and 20th centuries during periods of industrialization and colonization.

In a very real sense, corpora of SLs do not exist at the time of writing (2010). This may appear somewhat surprising given that there is clearly so much that corpora—and only corpora—could do to improve SL description and analysis in order to address practical real-world problems surrounding deafness, such as the education of deaf children and SL interpreter provision and training.

Until around 2004, the term “corpus” in the SL linguistics literature had not been used in the contemporary sense of “linguistic corpus.” A corpus in this sense means a collection of written and spoken texts *in a machine-readable form* that has been assembled for the purposes of studying the type and frequency of constructions in a language. A modern linguistic corpus contains digital texts of some kind with associated metadata that describe the participants and the circumstances under which the data were produced and collected. The linguistic units in the texts usually have annotations of various types appended to them. SL linguists have, however, continued to use “corpus” in the more traditional sense of a data set upon which a linguistic description or analysis has been based. This sense of corpus predates modern corpus linguistics which first began with the application of computer technology to language processing in the middle of the 20th century.

Until 2008, the data set of a SL “corpus” typically consisted of a collection of video recordings, with or without accompanying transcription, or simply a written transcription of SL produced by informants. In the latter case, the primary data were often not recorded or, if they were, they were never easily accessible or properly archived. Moreover, in some cases, the primary data were neither naturalistic nor representative of a language variety defined by explicit criteria. Indeed, some data sets only consisted of recorded sentences performed or elicited as demonstrations of grammatical structures of the described language, for example, the data available from the American Sign Language (ASL) Linguistic Research Project at Boston University. This is not what is nowadays expected in a linguistic corpus.

The reference to these data sets as “corpora” in the SL literature has the potential to mislead corpus linguists who may not be familiar with past SL linguistic practice as to the status of some published descriptions and analyses of these languages.

Corpus-Based Linguistics and Signed Languages

There are many arguments that have long been advanced in support of corpus-based language description and linguistic research and they all apply equally well to SLs. However,

there are several additional reasons why corpora are particularly important in SL research, some of them unique to this field of linguistics.

SLs are languages of minority communities that also have no real geographical presence, apart from home, school, or community meeting place. SLs experience interrupted inter-generational transmission for all but a tiny minority of users who are themselves born to deaf signing parents. Hence most SLs have few native users. In addition, SLs have no dedicated or widely used written form. Consequently, users sometimes appear to lack sets of shared linguistic norms that are often found in stable language communities, especially those with literacy and established standard varieties.

These facts create two major problems for SL researchers. First, although native user intuitions are of valuable assistance to linguists developing hypotheses regarding the use and structure of any language, these intuitions may be less useful in language description work in SL-using communities, all of which have been characterized as displaying high degrees of variation in both lexis and grammar. This variability means there is less consensus on phonological or grammatical typicality, markedness, or acceptability amongst users than is the case for a spoken language such as English. The practice in SL linguistics of relying on the intuitions of a small number of informants can thus be seen as problematic. Second, the representation of SL utterances using written glosses based on the majority spoken and written language that give little or no indication of sign form—the standard practice in SL linguistics—has meant that primary data have remained essentially inaccessible to other researchers and consequently unavailable for meaningful peer review.

In short, there is a particular need for creating recordings of naturalistic samples of SL produced by deaf adults and children so that they can be processed into language corpora in order to empirically ground our understanding of the structure, use, acquisition, and learning of SLs. Without corpora, one risks basing educational interventions and interpreting training, not to mention linguistic theory, on descriptions of SLs that may be inadequate.

Reasons for the Previous Lack of SL Corpora

Modern SL corpora had not been initiated before 2004 (see below) for three main reasons (see Crasborn, Efthimiou, Hanke, Thoutenhoofd, & Zwitserlood, 2008). First, the short history of SL language research practice and language description was strongly influenced up to the end of the 20th century by generative linguists who, believing in the “idealized native signer,” were comfortable basing their descriptions on the grammaticality judgments of an extremely small numbers of informants.

Second, developments in the representation and transcription of sign language data have not kept up with the growth of sign language research. SLs are face-to-face visual-gestural languages that have no widely accepted written forms or standard specialist notation system which can be used in transcription. In almost all research, glosses have been used to “transcribe” SL data. This practice gives little or no indication of form. Even if a dedicated notation system has actually been used to transcribe data, the fact that SLs meaningfully exploit space (by the placement or movement of signs in the space in front of the signer) and visual-gestural prosody (e.g., movements of the head and torso, changes in facial expression and mouth patterns and modifications in the speed and intensity with which manual signs are performed) in complex ways means that it still remained very difficult to do. Consequently, almost no extended SL texts of any kind have been created, either by glossing or by using a dedicated notation system that could in turn be digitized, read by computer, and further processed (e.g., tagged, searched, sorted, etc.). One notable exception is a gloss-based text file of New Zealand SL (NZSL) which consists of 100,000 sign tokens. It was used to produce the first lexical frequency profile of an SL (McKee & Kennedy, 2006).

Third, there has been a lack of suitable technology for SL capture and its secondary processing (see Crasborn et al., 2008). Although the technology of analogue recording (first vision, then sound) had been used in linguistics and anthropology from early in the 20th century (it took some time for advances in technology to make it possible to combine the two media), they could not be used to align the glossed or transcribed representation of the utterance to the actual media. (Recordings, nonetheless, did make it possible to capture the ephemeral linguistic event so that linguists could listen to or view an utterance repeatedly during transcription.) The absence of time-alignment and the difficulties in transcribing three-dimensional visual-gestural languages meant that in a fundamental sense no real SL source texts were created and made available for processing. This had to wait on further technological developments.

Changes in Theory and Technology Usher in SL Corpus Linguistics

Not surprisingly, given the history of linguistics in the 20th century, the first steps towards corpus-based research in the field of SL linguistics came in part from an interest in sociolinguistic variation. Just like modern linguistic corpora, sociolinguistic data sets consist of large representative samples of the language of different social groups in different settings and regions, possibly over a period of time. Large-scale SL sociolinguistic projects, for example, began with studies of ASL by Ceil Lucas and her colleagues (e.g., Lucas, Bayley, & Valli, 2001). In these studies, hundreds of hours of video data from 207 participants were analyzed for the correlation of social factors such as gender, age, race, and class with phonological, syntactic, and lexical variation in ASL. Also, again like modern linguistic corpora, these data sets included the collection of participant metadata. The sociolinguistic studies of Lucas on ASL were followed by similar studies by Adam Schembri and colleagues on Australian SL (Auslan), and David McKee and colleagues on NZSL (e.g., Schembri, McKee, McKee, Johnston, Goswell, & Pivac, 2009). Though all studies used large representative data sets with some basic explicit metadata, the source texts do not constitute corpora in the full modern sense because the data sets are not machine-readable. Nonetheless, they all represent an important step toward the corpus analysis of SLs with findings on language change-in-progress and regional variation in lexis (e.g., Lucas, Bayley, Reed, & Wulf, 2001), phonological variation (e.g., Schembri et al., 2009), and grammatical variation (Wulf, Dudis, Bayley, & Lucas, 2002).

The advent of digital audio and video recording in the late 20th century enabled transcriptions to be directly time-aligned with recorded segments. This, coupled with improvements in personal computer technology and multimedia annotation software in the early 21st century, made genuine SL corpora possible for the first time. The way in which recordings of face-to-face language could be best processed to create corpora for the purposes of linguistic analysis were transformed or multiplied, or both (cf., Beal, Corrigan, & Moisl, 2007). For instance, the source text from that point onwards could remain the primary data itself (i.e., the SL video recording), rather than being necessarily replaced by its representation in a transcription to which annotations were subsequently appended.

For SL researchers, this meant that it became possible to use glosses productively in a digital multimedia environment by exploiting the fact that glosses are “mere” annotations, rather than using them as second-best compromise transcriptions. This can be achieved by ensuring that conventional linguistic units and types are systematically and consistently identified with invariant and unique sign identifiers (or “ID-glosses”) to which linguistic annotations can be added (see Johnston, 2010).

One of a number of multimedia annotation software programs suitable for use by SL researchers wishing to create corpora is called ELAN (EUDICO Linguistic Annotator) (Max Planck Institute for Psycholinguistics Language Archiving Technology Group, 2009). One may analyze a corpus of multiple annotation files in ELAN alone or export the annotations into other corpus analysis programs. In ELAN, for example, one can easily extract frequency statistics for any annotation (gloss or linguistic tag) and identify the environments in which they occur. These searches can be further constrained by specifying aligned or overlapping values on multiple tiers within the annotation file and by metadata values such as age, gender, region, text type, and so forth associated with various files. The search routines in ELAN can display multiple individual matches in a concordance view.

With the development of digitized video recording and multimedia annotation software, the creation of SL corpora became possible. They are best described as subtypes of “spoken” (or, better, face-to-face) multimedia language corpora.

The Creation of SL Corpora Begins

To create a SL corpus one needs to take the above facts into account as well as observe generally accepted principles of modern corpus linguistics—namely, a corpus should be representative (e.g., a collected set of texts should accurately reflect the language of an identified entity), well-documented (e.g., with relevant metadata), and machine-readable (e.g., able to be searched and processed electronically) (McEnery & Wilson, 2001; Meyer, 2002; Teubert & Cermáková, 2007). This requires dedicated technology (e.g., computers and software), standards and protocols (e.g., agreed metadata categories), and shared or at least transparent terminology (e.g., grammatical class labels) (Crasborn, van der Kooij, Broeder, & Brugman, 2004). Importantly, any secondary processing of the primary data should ensure and facilitate machine-readability, which basically means that annotation should take priority over transcription.

In 2004, the first SL corpus project began with a digital video archive of recordings of deaf native, early learner, or near-native signers of Auslan (a similar, but considerably smaller project began on Irish SL in the same year). Each participant took part in three hours of language-based activity that involved an interview, the production of narratives, responses to survey questions, free conversation, and other elicited linguistic responses to various stimuli such as a picture-book story, a filmed cartoon, and a filmed story told in Auslan (see Johnston & Schembri, 2006). The archive was collected as part of an Endangered Languages Documentation project (SOAS, London University) with the intention that it would serve as the basis of a large machine-readable SL corpus in the modern sense. The Auslan corpus consists of these archive recordings and their linked ELAN annotation and metadata files. The corpus, however, is only really being created as the annotation files are completed. This work began in 2007 and it is expected it may take at least five years before a basic reference corpus of the entire video archive is completed (i.e., a minimal annotation set of time-aligned ID-glosses and English translation). Detailed multi-tier annotation would take even longer.

Since the work began on the creation of the Auslan corpus a number of other SL corpus projects have begun—Netherlands SL (NGT), British SL (BSL), NZSL, French SL, German SL, and Swedish SL—or are planned (e.g., ASL) at the time of writing. The first stage of the NGT corpus was completed in 2008, in the sense that the archived video recordings had been edited and catalogued and were made accessible through a digital video archive on the Internet. However, by the end of 2009, only a small percentage of the NGT video files had been annotated or translated into a parallel written text. The creation of these different sign language corpora signals the beginning of a period of corpus-based research

in SL linguistics which is certain to lead to a much better understanding of structure and use of these languages.

Corpus Analysis of SLs Begins

SL corpora promise to improve peer review of descriptions of SLs considerably and make possible, for the first time, a corpus-based approach to SL analysis. Corpora are important for the testing of language hypotheses in all language research at all levels, from phonology, through lexis, morphology, syntax, and pragmatics to discourse.

By way of example, consider the study by de Beuzeville, Johnston, and Schembri (2009) on the spatial modification of verbs in the Auslan corpus. A subset of verbs in most sign languages may have their initial place of articulation, their final place of articulation, or both modified so that the verb signs are directed from and towards present referents, or locations associated with absent referents. These spatial modifications are used to express who does what to whom, with initial locations, for example, often reflecting the location associated with the agent argument (i.e., the “doer” of an action) and the final location with the patient argument (i.e., the person or thing “done to”). This investigation examined the frequency and linguistic environments of verb modification with a view to assessing if spatial modification to signal these roles was obligatory in the language. The spatial modification of verb signs in SLs has traditionally been explained as a grammatical system marking subject and object role (e.g., Sandler & Lillo-Martin, 2006), similar to obligatory subject marking in English (e.g., third person singular *-s* in *he walks*). This study found that the modifications were not obligatory, were strongly associated with a very small number of high frequency verbs, and tended to co-occur in specific linguistic environments. The authors suggested that these observations would not be expected under the traditional grammatical account of spatial modification and they are more in keeping with an analysis that sees the phenomenon reflecting, in part, the fusion of gestural pointing into the articulation of lexical verbs, as suggested by Liddell (2003).

The existence of (the beginnings of) an Auslan corpus made this study possible in more than one way. For example, the very identification of high frequency lexical verbs was only made possible through the corpus itself. This finding could then be added to the corpus and by way of verb frequency tagging become itself a factor in the further analysis of the corpus.

Conclusion

The creation of SL corpora as corpora in the modern sense involves more than recording, digitizing, editing, cataloguing, and archiving video texts. This is not to deny the importance of the creation of reference archives for SL researchers. After all, until the time of writing, there have been very few publicly available reference texts of any SL. Nonetheless, corpus creation must involve the transformation of archived material into something which is machine-readable by the principled application of annotation procedures that make optimal use of new digital technologies.

It is to be expected that, as the SL corpus projects around the world gain momentum and yield larger and larger machine-readable data sets, debates surrounding various lexical and grammatical features of SLs (e.g., lexical variation, verb “agreement,” question formation, constituent order, grammatical relations, and so on, see Johnston & Schembri, 2007) will be transformed by the introduction of representative naturalistic usage data. Similarly, the analysis of native signer corpora will enable educators of the deaf and SL interpreter trainers to ground sign language curricula and assessment procedures

empirically, both of acquisition milestones for deaf children and proficiency rating for L2 SL interpreters. As SL corpus linguistics grows, it is also expected that the newer corpora will, from the outset, be representative of the entire signing community (not just native signers), and that “older” corpora—like the Auslan, NGT and BSL corpora—will be augmented by data from non-native signers.

Corpus Analysis of Spoken English for Academic Purposes

RITA SIMPSON-VLACH

Within the broader field of English for Specific Purposes, English for Academic Purposes (EAP) has become a heavily investigated area. However, within this arena, attention has tended to focus heavily on written rather than spoken discourse. Collections of academic written language are easier and less costly to assemble, and therefore corpus-based EAP research on written genres has flourished to a greater extent than comparable research on spoken genres. However, in spite of this imbalance, several corpora of academic speech are now available, and analyses of spoken EAP now span a wide and growing range of topics.

Prior to the development of spoken language corpora, the study and teaching of spoken academic language relied heavily on some combination of written academic discourse, conversational speech, or intuition to provide models of spoken language in academic contexts. With the availability of specialized corpora of academic speech, researchers and teachers gained access to resources that permit investigations of specific questions about grammar, lexis, usage, and discourse patterns as these actually occur in spoken academic contexts. These research inquiries have begun to fill in the gaps in our knowledge about the characteristics of academic speech as a specialized language genre. Results from such investigations are of interest to both applied linguists generally as well as EAP teachers and materials writers who can use such insights to better inform their teaching and materials development. A judiciously sampled spoken academic corpus constitutes a valuable research resource and set of models characterizing the spoken language that students will encounter and need to produce in the course of their academic endeavors.

Spoken EAP Corpora

The pioneering advances in this arena came in the late 1990s with the development of two corpora of academic language in the United States. One of these was a combined spoken and written corpus, the TOEFL 2000 Spoken and Written Academic Language (T2K-SWAL) corpus, compiled by Biber and his colleagues at Northern Arizona University (Biber et al., 2004). The other was a corpus of academic speech, the Michigan Corpus of Academic Spoken English (MICASE), compiled by a team of researchers at the University of Michigan (Simpson, Briggs, Ovens, & Swales, 2002). Following shortly thereafter and modeled on MICASE was another similar corpus created in Britain, the British Academic Spoken English Corpus (BASE) (Thompson & Nesi, 2001). The latter two corpora are both freely available for research and teaching, and MICASE provides a dedicated online search engine. The T2K-SWAL corpus is proprietary and available for research only to a limited number of affiliated researchers, many of whom continue to conduct ongoing research based on this important resource. These three corpora—MICASE, BASE, and the spoken component of the T2K-SWAL corpus—are all approximately the same size, at roughly 1.6 to 1.8 million words.

Another important spoken EAP corpus project developed more recently in Europe is the English as a Lingua Franca in Academic Contexts (ELFA) corpus, compiled in Finland by Mauranen and colleagues (Mauranen, 2007). This corpus arose out of the recognition that English has established itself as the global lingua franca, and non-native speakers of English now outnumber native speakers around the world. Within academic domains, English constitutes the primary language of communication for a great number of people speaking it as a foreign or second language, often in communities with speakers from different language backgrounds. Corpora of spoken English, however, have by and large focused on or restricted themselves to native speakers. The ELFA corpus, with one million words of transcribed speech, provides a crucial resource for studying the linguistic features of this lingua franca both as a language variety in its own right and as an important component of academic speech.

In addition to these dedicated collections of academic speech, some larger corpora include a proportion of academic speech in their holdings, such as the British National Corpus (BNC), the Vienna-Oxford International Corpus of English (VOICE), and the Corpus of Contemporary American English (COCA). To the extent that the sub-corpora of these larger corpora are searchable separately from the rest of the non academic and written genres, they could constitute additional resources for the study of spoken EAP. For the most part, however, the spoken academic sub components of these larger corpora are not fully exploitable as EAP tools because they are not readily segregated from the larger corpus. Additional corpora of academic spoken English are being developed in other countries, but at the time of writing (2010) are either not yet publicly available, or not yet complete. Finally, a number of researchers have compiled more or less ad hoc corpora of specific spoken academic domains for particular research projects. One such example is Camiciottoli's (2007) work on the language of business studies lectures, based on a small corpus of 12 L1 and L2 lectures in the fields of business and economics. However, since such corpora tend to be fairly small (rarely encompassing more than 100,000 words) and are not generally widely available for additional research by other scholars, they have not become major influences on spoken EAP research, but have rather contributed incrementally to the growing body of knowledge about spoken academic genres.

Spoken academic English takes many forms, and each of the corpora described above delineates the universe of academic speech slightly differently. Even within a university setting, determining exactly which speech contexts fall into the category of "academic speech" is not always simple. It is generally agreed that the language of classrooms—that is, lectures, seminars, and class discussions—are central genres of academic speech, and all the academic speech corpora include a large percentage of classroom speech. Of all the spoken academic corpora, MICASE includes the widest range of speech events, from classroom lectures, discussions, and seminars, to laboratory sessions, student presentations, one-on-one tutorials, advising sessions, research interviews, dissertation defenses, public colloquia, meetings, study groups, and academic service encounters. The T2K-SWAL corpus includes fewer different speech event types; class sessions are the most common, followed by in-class groups, office hours, study groups, and service encounters. The BASE corpus is more streamlined yet, containing only lectures and seminars. It is also well established that in order to be representative of academic speech in general, spoken academic corpora must encompass a wide range of subject areas, from the hard sciences and engineering to the social sciences, humanities, and arts subjects. However, not all academic speech corpora have sampled equally from the academic subject domains, and indeed given the vast number of academic fields and the different ways these are categorized from one country to another or even one university to another, it would be nearly impossible to do. These inconsistencies make comparative research using two different corpora more challenging.

These spoken academic corpora are indeed valuable collections of previously unavailable

data that constitute an important resource for EAP practitioners. Nevertheless, it is important to note that within the larger world of corpus linguistics, and even when compared to academic written corpora, the 1 to 1.8 million words of ELFA, MICASE, BASE, and the spoken component of the T2K-SWAL corpus are considered rather small corpora. The small size is a limiting factor primarily in the context of vocabulary studies, but in other respects, particularly for studies combining corpus linguistics and discourse analytic methods, the small size and often correspondingly richer contextual information available can be an advantage.

Analyses of Academic Spoken Corpora

Broadly speaking, corpus-based analyses of spoken academic discourse can be grouped into three major sub categories: research on vocabulary or phraseology, research on grammar, and research on discourse patterns; although there is in fact much overlap among these divisions. The overarching research questions relating to spoken EAP are: What are the linguistic characteristics of contemporary academic speech—its grammar, its vocabulary, its discourse structure, its functions and purposes? Is it possible to situate academic speech along a continuum between academic prose and casual (non academic) conversation? Put another way, do academics speak like they write? Another related question is whether within academic spoken contexts the characteristic linguistic features vary according to academic disciplines or the different academic roles of speakers. Researchers working on spoken academic language are attempting to answer aspects of these larger questions from a variety of angles.

Analysis of Vocabulary and Phraseology

The publication of the Academic Word List (AWL; Coxhead, 2000), which was based on a 3-million-word corpus of academic written texts, has been of great benefit to EAP teachers and materials writers. One obvious extension of this effort might be to compile a comparable word list based on academic speech. At the very least, it would be worthwhile to know if the words and word families of the AWL occur in the same proportions in academic speech. However, given the comparatively small size of academic spoken corpora as noted above, this turns out to be not such an easy task. A corpus of 1.6 million words is not large enough to provide sufficient instances of important but less frequent words. Similarly, due to inconsistencies between the topics included, certain vocabulary words might appear more frequently than others merely by virtue of the sampling bias. For these primary reasons, as of 2010 a comprehensive spoken version of the AWL has yet to be compiled.

In spite of these limitations, there have been at least partial attempts. Thompson (2006) analyzed the vocabulary of the one million words of lectures in the BASE corpus, and proposed an Academic Lecture Word List which contained 230 word families, far fewer than the AWL's 570. This is important information for EAP teachers, because it means that of the 570 AWL word families, more than half are likely to be favored in writing and therefore not suitable for emphasis in a speaking course. Like the AWL, the Academic Lecture Word List is divided into sublists by frequency and by broad content domains, giving EAP researchers and teachers the ability to identify words that are common in all disciplines, or more common in, for example, the physical sciences than in the social sciences or life sciences.

Another related area of considerable ongoing research interest has been the study of the phraseology of academic discourse—recurrent three- to five-word sequences which are variously called multi word expressions, formulas, or lexical bundles. This line of inquiry has been more fruitful than investigations of vocabulary alone, because smaller

corpora can provide more insights into phenomena like multi word phrases that are relatively more frequent. Several general findings about the phraseology of academic speech have been noted. First, most spoken academic genre types have a higher frequency of recurring sequences of words (i.e., strings of words that appear together frequently) than comparable written genres. This accords with the more general observations that speech is replete with recurring high-frequency phrases and repetition is far more prevalent in speech than in writing.

Given other characteristics of academic speech that position it somewhere between general conversational genres and academic prose (e.g., grammatical features), we might expect academic speech to have fewer multi word expressions than conversation, but more than academic prose. However, in fact, in the case of classroom teaching, Biber's (2006) analysis of lexical bundles reveals that there are in fact *more* recurrent multi word phrases than in other spoken registers. This finding is of great potential importance to EAP teachers, and has been explained as a function of the interactive, personal nature of classroom teaching combined with its high-information-density language features. Lexical bundles, or phrases, function to segment and organize discourse structure, flag information status, signal transitions, convey stance, and generally to bracket the presentation of knowledge in various ways.

A more recent project relating to the phraseology of academic discourse is the Academic Formulas List (AFL; Simpson-Vlach & Ellis, 2010), a project which used a statistical measure called mutual information, in addition to frequency, to arrive at three separate lists—one for spoken, one for written, and one core list encompassing both spoken and written discourse—of three-, four-, and five-word phrases that are both salient as coherent chunks or phrases, and that are statistically more frequent in academic than in non academic discourse. The top five phrases of the core AFL are: *in terms of*, *at the same time*, *from the point of view*, *in order to*, and *as well as*; the top five phrases of the Spoken AFL are: *be able to*, *blah blah blah*, *this is the*, *you know what I mean*, and *you can see*. It is evident from just this glimpse of the Spoken AFL that academic speech resembles other spoken genres (although these phrases all occurred more frequently in academic speech than in corpora of ordinary conversation). Academic speech predictably has more recurring formulas than academic writing, a finding corroborated by other research. The AFL should prove to be a useful resource for EAP teaching and testing purposes, and presumably the spoken component of the list will be an especially valuable resource, since at the time of writing (2010) there have not been any comprehensive lexical reference lists based solely on spoken academic discourse.

Other questions surrounding the vocabulary of academic discourse have been studied by Biber (2006), who reported several findings about academic speech. In this study, he looked specifically at classroom teaching and found a smaller number of word types, many of which occurred with very high frequencies, especially compared to academic writing (e.g., *get*, *say*, *think*, *want*, *see*, *thing*). In addition, classroom teaching uses fewer low-frequency specialized words and relies more heavily on common high-frequency content words.

Analysis of Grammar

The comprehensive analysis of the grammar of academic speech has been limited primarily to studies done by the T2K-SWAL research team, mainly because it was originally tagged for part-of-speech, unlike other corpora that either were not tagged or were tagged some time after their original compilation. Part-of-speech tagging facilitates more comprehensive and detailed grammatical analyses rooted in quantitative methods.

Biber (2006) reports the findings of quantitative grammatical analysis of the T2K-SWAL corpus. The most basic grammatical analysis involves looking at the relative frequencies

of nouns and verbs in a given genre (part of the lexicogrammar). Spoken academic registers as a whole have roughly equal frequencies of nouns and verbs in contrast to written registers, which rely much more heavily on nouns. Correspondingly, spoken registers have more adverbs than adjectives, whereas the reverse is true for written registers. Separating out classroom teaching from the other academic spoken genres, however, the results show that nouns are slightly more frequent than verbs, situating this kind of talk closer to academic writing in that respect. Spoken registers predictably have a higher incidence of pronouns than written registers. The profile of verbs in academic speech shows that the present tense is overwhelmingly preferred over the past tense; similarly, simple aspect and active voice verbs are the norm; slightly higher percentages of verbs occur in the progressive aspect than the perfect aspect, and fewer than five percent of verbs occur in the passive voice. Characteristics of adverbial clauses are also interesting; these are more common in spoken registers, especially conditional adverbial clauses (e.g., *if*-clauses). Causative adverbials (e.g., *because*-clauses) are less common than conditionals, but still more common in spoken registers, and are especially prevalent in study groups. Finally, complement clauses, mainly *that*-clauses, are more common in spoken than in written registers, especially in the interactive registers. These findings help establish a baseline profile of the lexicogrammar and clausal features of academic speech, which in turn provide a more reliable basis for linguistic comparisons between genres, as well as for the creation of EAP teaching materials. For example, when teaching vocabulary words like *establish* and *establishment*, it is helpful to bear in mind the noun-heavy characteristics of written genres compared to spoken genres, and vice-versa.

A number of other studies of the grammar of academic speech have been conducted by Swales and his colleagues and published on the MICASE website (MICASE, 2009). These brief summary reports have included topics such as the distribution of *data* as a plural versus singular noun; the use of *among* and *between*; modal contractions with *will*; the use of vocatives; and anaphoric *so*. Unlike the grammatical analyses based on part-of-speech and clause types, these studies of grammatical features in MICASE tend to be exploratory in nature and to span an eclectic range of topics, and they are based on a combination of concordance searches, quantitative analyses, and pragmatic or discourse analysis. These studies are premised on the assumption that the language features in question are often problematic for students, and therefore of interest to both EAP teachers and students.

Analysis of Discourse and Pragmatic Features

Probably the largest number and variety of studies of academic spoken corpora fall into the category of pragmatics and discourse, although these often overlap with analyses of vocabulary or grammar.

Several early studies on MICASE examined hedging. One study looked at the ubiquitous hedges *kind of* and *sort of* from a cross-disciplinary perspective (Poos & Simpson, 2002). This research concluded that these common hedge words (also called mitigators or qualifiers) are more frequent in the humanities and social science disciplines than in the physical and biological sciences. This finding was further confirmed in a later study (Simpson-Vlach, 2006) of a larger set of lexical and phraseological differences across disciplines. Other researchers have examined hedging and the related phenomenon of vague language in academic speech. Another early MICASE study examined the discourse-pragmatic features of the word *just*, a lexical item that is among the most frequent in distinguishing academic speech data from roughly comparable written data (Lindemann & Mauranen, 2001). That research identified a number of different functions of *just* in academic speech, showing that its more commonly taught temporal function—as in *she has just arrived*—is the least frequent in academic speech, vastly outnumbered by the use of *just* as a mitigator, often collocating with other hedges and metadiscourse signals—as

in *so let me just talk about those a little bit more*. Another early MICASE study looked at the use of clusters of discourse markers and noted how often clusters such as *okay, so now* are used to signal topic transitions in academic speech and contribute to the cognitive task of discourse management (Swales & Malczewski, 2001). Several studies have been done on pronouns—*we, I, and you*—and their discourse-pragmatic role in creating interactivity in lectures.

In all of the studies of pragmatic or discourse-level features, the approach is generally to begin with a quantitative overview of the feature(s) in question, but then to use the corpus data as a contextualized resource for qualitative analyses. These types of studies take as their departure point an assumption that the discourse feature under investigation is pedagogically relevant.

Teaching Applications for Spoken EAP

Teachers of spoken English for Academic Purposes need access to accurate models of academic speech in order to make curricular decisions, design effective teaching materials, plan lessons, and coach students as they work toward mastery of the spoken genres of the academic world. The emerging body of research on spoken EAP corpora provides teachers with a wealth of valuable resources. The larger-scale quantitative-based vocabulary and grammar studies, as well as the more qualitative discourse and pragmatic research findings, are all relevant to EAP teaching as they inform the linguistic content knowledge of teachers, providing insights into characteristics of academic speech that are distinct from academic writing or ordinary conversation.

Some scholars have used spoken corpora as the basis for creating teaching materials for academic speech. Nesi (2001) and colleagues produced a multi-media set of classroom teaching materials called EASE (Essential Academic Skills in English) using the videotaped seminars and lectures of the BASE corpus. Simpson-Vlach and Leicher (2006) wrote a handbook to accompany the MICASE corpus which includes a wide range of pedagogical suggestions for incorporating corpus-based exercises and research findings into classroom teaching. Their sample pedagogical materials include a lesson on formulaic expressions derived from MICASE, with examples such as *it seems to me, keep in mind, it turns out, and more or less*. Each phrase is presented in context, with exercises to identify the meaning or function as well as suggestions for speaking and listening practice using the formulas. Other teachers have made use of concordance-style or computer-based corpus searching in the classroom, a somewhat controversial practice among EAP practitioners, as the concept of “data-driven learning” is championed by some but not universally accepted as an efficient use of classroom time. Corpora of academic spoken English have become increasingly valuable in the field of EAP, and the available resources, while still not as plentiful as those for written corpora, are sufficient to provide language teachers with opportunities to incorporate existing teaching materials into their classes, devise original corpus-based materials, or conduct research to inform classroom practices and curriculum.

Corpus Analysis of the World Wide Web

WILLIAM H. FLETCHER

Introduction

The World Wide Web has become a primary meeting place for information and recreation, for communication and commerce, for a quarter of the world's population. Millions of Web authors have created billions of Web pages, unknowingly providing texts to be mined for their linguistic and cultural content. The Web has evolved into the resource of first resort for lexicographers and linguists, for translators, teachers, and other language professionals. As a source of machine-readable texts for corpus linguists and researchers in complementary fields like natural language processing (NLP), information retrieval, and text mining, the Web offers extraordinary accessibility, quantity, variety, and cost-effectiveness. Investigators in these disciplines have developed scores of tools and products from Web content for both researchers and end users, and authored hundreds of scholarly papers on their projects.

This entry reviews the rewards and limitations of either acquiring Web content and processing it into a static corpus, or else accessing it directly as a dynamic corpus, a distinction captured in "Web for/as corpus" (De Schryver, 2002); here "Web corpus" serves as a cover term for both approaches. In the process, this entry surveys typical applications of such data to both academic analysis and real-world situations, discusses tools and techniques available to motivated language professionals and learners, and outlines future directions for Web corpus development.

Advantages and Limitations of Web Corpus

The Web corpus owes its popularity to its tremendous size; broad linguistic, geographic, and social range; up-to-dateness; multimodality; and wide availability at minimal cost. We shall consider each advantage briefly before discussing the limitations of the Web corpus.

Size

The Web universe is constantly expanding, so its size is unknowable. In 2008 Google noted that it had identified (but not actually indexed) over a trillion (10^{12}) distinct URLs (Web addresses), and that several billion (10^9) new Web pages appear daily (Alpert & Hajaj, 2008). Estimates suggest that Google indexes about 40 billion Web pages; the search engine (SE) Cuil.com's home page claims to index 127 billion, albeit with much repeated content. Size is about more than impressive statistics: Halevy, Norvig, and Pereira illustrate "the unreasonable effectiveness of [huge sets of] data" derived from the Web when applied to NLP problems like automatic speech recognition (ASR) and machine translation, arguing that "invariably, simple models and a lot of data trump more elaborate models based on less data" (2009, pp. 8–9), an insight reflected in the steadily improving quality of their employer Google's online translation and speech transcription tools. Size also matters

because many words and phrases are relatively infrequent, so even large traditional corpora like the British National Corpus (BNC, 100 million words) offer few examples if any of familiar constructions to be found in abundance online.

Range

Once overwhelmingly Anglophone and Eurocentric, the Web has become truly World Wide, encompassing most of the earth and its written languages; English-language users and content now have minority status online (Top Ten Languages—Internet World Statistics, 2009). The availability of Web text has stimulated the development of corpora, lexica, and NLP tools for under-resourced languages across the globe, including Africa (<http://AfLaT.org>) and southeast Asia (<http://SEAlang.net>). Internationally oriented sites provide multi-lingual material which can aid translators and language learners. Online social networks have redefined our notion of community, bringing formerly private interaction into public view. In one example, such open access to informal discourse permitted Thelwall (2008a) to compare swearing on the social site MySpace by male and female teenagers and middle-aged adults from the UK and the US; users unintentionally supplied both linguistic and demographic data.

Up-to-Dateness

Major SEs closely track unfolding events and incorporate content from online communities with minimal time lag, enabling real-time study of current topics and emerging usage. Indeed, the Web and associated technologies have been both the catalyst for much linguistic creativity and the main vehicle for its dissemination. The Web is the most effective resource to research and document linguistic reflections of contemporary culture. In contrast, any static corpus is cut off at the moment of its compilation. For example, since the enormous Google 1T corpus, based on a trillion words of online English, was completed shortly before the appearance of the social site Twitter, it lacks any trace of the hundreds of playful neologisms coined by “tweeple.”

Multimodality: Sound, Sight, and Text

Video and audio represent a sizable segment of online content, but search and linguistic analysis such as part-of-speech (PoS) tagging and concordancing require machine-readable written text. Some commercial news broadcasts and interviews are available in transcript form (Hoffmann, 2007), affording access to scripted and unscripted language in both spoken and written form. Sites which provide searchable (and downloadable) transcripts of audio content via ASR have come and gone, but new technologies are emerging to provide comparable services for online video: Exalead’s Voxalead, Google Audio Indexing, YouTube ASR captioning and translation, and, most impressively, IBM TALEs, which supports search with English queries for video content in other languages and provides reasonably accurate original and machine-translated text. Such sites enable Web corpora which combine video or audio material with written text.

Availability

In the developed world, Internet access is fast and inexpensive, and the growing demand in developing countries continues to improve service and reduce costs there as well. With an inexpensive PC and a home broadband connection one can compile and process a multimillion-word corpus in minutes. Besides Web-only content, such a corpus can contain material available in other forms, such as articles from newspapers and magazines, entire

books, and even movie subtitles. Thanks to the Web, acquisition of computerized text in almost any modern written language has become a straightforward task.

Limitations of Web Corpus

Despite the obvious benefits, Web content has drawbacks and limitations as linguistic data. Unless one restricts oneself to preselected sites, the source and linguistic properties of a Web page remain unknown. For whom and what purpose is the text intended? What geographic and demographic origin and target audience does it represent? Was it written carefully or carelessly by a native speaker, or is it an unreliable translation by man or machine? Is the document authoritative—accurate in content, and representative in linguistic form? Typically a Web corpus cannot answer such questions, which reflect key elements in the design of traditional corpora. Other caveats and limitations are discussed below.

Web as/for Corpus (WaC/WfC)

Web as Corpus

The most widespread approach to accessing the Web as a corpus is through commercial SEs like Google, Yahoo!, or Bing. For some purposes a quick glance at snippets of search terms in context on a search engine results page (SERP) suffices. For further insight users can retrieve Web pages from the SE's cache to display all occurrences of the word forms matched, highlighted in context—a rudimentary but rapid sort of concordance.

In another scenario a user queries an SE for alternate forms, phrases, or spellings, then compares the number of hits reported; Googlefight.com animates such comparisons. Not surprisingly, some linguists have based serious discussions on the comparison of “ghits” (Google hits), an unreliable practice for several reasons (Kilgarriff, 2006). Hit counts are very different from corpus frequencies: They reflect the number of matching Web pages, not actual occurrences, and a single page may be counted for alternate search terms. Many Web pages duplicate each other's content, inflating the counts. Indeed, “most widespread” does not necessarily mean “preferred”: “ungrammatical” German *da werden Sie geholfen!* ‘You (formal) will be helped there!’ gained popularity as an advertising slogan, so it is far more frequent online than “correct” *da wird Ihnen geholfen!* In contrast, the “grammatically correct” analog with informal *dir* wins this Googlefight by a five-to-one ratio. Similarly, reinterpretations of common English phrases like *straight-laced*, *hone in on*, *font of wisdom/knowledge* rival or exceed the accepted spellings in frequency online.

Hits tally more than exact matches, further skewing page counts. To identify potential hits in major languages which do not match a query exactly, SEs typically apply *stemming*, that is reduction to a base form, erasing distinctions among, for example, verb forms and even verbs and related nouns, so a search for *governed* also matches pages with *governing* or *government*. The dominant Russian SE Yandex.com performs similar simplification of morphologically far more complex languages like Russian and Kazakh, one factor in its success in the region. Some Web pages are included in hit counts not for their own text but for the content of pages linking to them. SEs ignore punctuation, so some reported hits for a phrase might be spread across a phrase or sentence boundary. Diacritics are treated inconsistently or simply disregarded. Most importantly, reported hit counts only roughly approximate the actual number of matching documents, and can vary greatly even within a few minutes. Particularly misleading is the “union of sets” problem: hit count algorithms typically underestimate results for an OR query, reporting fewer matches for alternate search terms than for one of the terms alone. (For details of such issues see Duclaye, Collin, & Pétrier, 2006; Fletcher, 2007a; Thelwall, 2008b; Uyar, 2009a, 2009b).

As gatekeepers of the Web, the major SEs also have limitations for users who want to explore the language behind the hit counts. They are useful for linguistic research by coincidence, not by design, and their services are subject to change or cancellation without notice. Since they exist to steer impatient searchers toward any relevant Web pages, major SEs limit results to the top 1,000 matching URLs as ranked by proprietary schemes, which tend to favor media and similar popular sites, and often tailor result sets to give prominence to the most popular matches and to reflect the user's geographic location and past search activity. Such second-guessing of the searcher's intent can skew results and mask the full range of possible matches.

Despite such limitations, the three major SEs do afford effective access to a significant subset of the Web: only they have the massive infrastructure required to discover, index, store, and retrieve data from billions of Web pages efficiently. By delivering results which favor text-rich pages and authoritative sites, and which reduce the number of duplicate and questionable documents, they raise the quality of SERP content. Several free tools facilitate WaC research via these SEs. For example, WebCorp (www.webcorp.org.uk; Renouf, Kehoe, & Banjee, 2007) provides an online service to query SEs, then generate concordances, word lists, and document metrics from matching Web pages. KWicFinder (<http://kwicfinder.com>; Fletcher, 2007a) runs on a PC to produce concordances from Web pages; it can save local copies of pages retrieved for further analysis or inclusion in an offline corpus. While these tools are optimized for European languages, some SE-intermediary sites such as the SouthEast Asian Language Web Corpus (<http://SEALang.net>) focus on other regions. In contrast, WebAsCorpus.org (Fletcher, 2007b) concordances Web pages in any language and character set. To enable rapid creation of ad hoc corpora, this site compresses matching Web pages into a single zipfile for download and offline analysis.

All three of these applications provide rapid answers to questions of language usage with examples highlighted in context, but the total number of matching documents is limited by the SEs. To build larger Web corpora, the BootCaT software package (<http://bootcat.sslmit.unibo.it>; Baroni & Bernardini, 2004) starts from a user-provided list of seed terms and iteratively queries an SE, retrieves documents, extracts related terms, then re-queries the SE with these new terms and repeats the process. Another free suite of tools, Jaguar, extracts specialized corpora from the Web and analyzes various lexical features statistically (Nazar, Vivaldi, & Cabré, 2008). Its document-clustering techniques reduce extraneous content by filtering Web pages based on their similarity to user-designated documents. Since Jaguar provides data processing and storage, it places fewer demands on the user's technical expertise and infrastructure.

Tools like WebCorp and WebAsCorpus.org are regularly used by translators, writers, and language learners to verify usage and refine and enrich their writing. Language teachers enlist them to find authentic examples and appropriate texts for their students. Of course, such applications require the user to identify concerns, initiate a search, and evaluate the result. A new generation of SE-based tools for foreign language professionals and learners aims to support the writing process transparently. For example, Microsoft's Web-based ESL Assistant detects a number of common learner errors (e.g., articles, prepositions, word order) and suggests improvements based on both large-scale language models derived from Web data and real-time SE queries (Gamon et al., 2009). It highlights potential problems and furnishes examples of alternative formulations, along with confidence scores derived from SE hit counts.

Other important SEs could also be tapped by applications like those described above. They provide alternative gateways to the Web with different features, search results, and focuses. For example, Exalead.com still supports in-word wildcards and proximity operators (* and NEAR), features dropped by AltaVista in 2004. Baidu.com, the leading SE in China, indexes content from Asian countries not accessible via other SEs. There are

hundreds of niche SEs for specific languages, regions, or content areas which can be harnessed for WaC.

Web for Corpus

“Crawling” or “spidering” the Web to compile a do-it-yourself corpus offers a powerful but challenging alternative to SE-mediated access. Starting from a list of “seed” URLs, crawler software “harvests” Web pages, saves copies locally, extracts links, downloads new Web pages linked to them, then repeats the process until user-defined criteria are met. Crawlers can be restricted to desired domains (e.g., UK, RU) or Web sites (e.g., a specific newspaper, government or social site), and limits can be set on the thoroughness with which each site is harvested.

After downloading, Web pages must be processed for importation into corpus analysis tools and databases. This entails converting the various document formats found on the Web (HTML, PDF, DOC, etc.) into clean plain text, a very challenging process, especially for languages with multiple encoding schemes for non-Roman scripts (e.g., Khmer, Burmese, Japanese), and detecting the language to filter out extraneous material. To reduce noise and improve representativeness one may also remove “boilerplate” or “template” elements (content recurring on each page, navigation links, etc.), nearly identical or highly repetitive documents, and Web pages not consisting primarily of coherent text (Fletcher, 2004; Baroni & Kilgarrieff, 2006; Scannell, 2007). To enhance usefulness for linguistic research, the texts may also be tagged with grammatical information and/or normalized, for example converted to lower case or corrected for typographical and spelling errors.

Many software applications are available to crawl the Web and process Web pages into usable text, but such solutions typically require programming expertise to customize and coordinate the various processes. A rare exception is multiplatform *GroMoteur*, which produces concordances either by spidering the Web from a list of seed URLs or by querying Yahoo! directly. For the more technically proficient, Web Archive’s *Heritrix* crawler and complementary applications offer greater flexibility and power.

Some free academic sites support Web corpus creation and annotation by harvesting online content on demand and processing it according to the user’s specifications. *Glossa.net* calls itself a “watch engine”: a user registers a query for specific terms or structures in a variety of languages and receives concordances enhanced with morphological, syntactical, and semantic information as *Glossa.net* encounters them. Alternatively one can take advantage of numerous free application programming interfaces (APIs) to Web services to perform sophisticated tasks through simple scripts adapted from sample code. For example, *AlchemyAPI* retrieves and processes Web pages, supporting language detection, text extraction (content minus boilerplate), and document categorization by topic. The site *uClassify* offers predefined document classifiers (e.g., detection of language, author gender) as well as a customizable module which can be “trained” to classify texts by genre or topic.

The following paragraphs survey representative examples of Web corpora acquired through crawling. The *Crúbadán Project* (Scannell, 2007) is compiling corpora for 431 under-resourced languages to enable translation and adaptation of open-source end-user applications (word processors, spellcheckers) for those languages. The *Leeds Collection of Internet Corpora* (Sharoff, 2006) provides a search interface to large (up to 100 million words) linguistically annotated corpora in a dozen European and Asian languages. The *WaCky Project* has compiled tagged corpora of one to two billion words each for several European languages available for free download to academic researchers (Baroni, Bernardini, Ferraresi, & Zanchetta, 2009). Much larger tagged corpora with target sizes of 10–20 billion words have been developed, including WebCorp’s *Linguists Search Engine* (Renouf, 2009) and *BiWeC* (Pomikálek, Rychlý, & Kilgarrieff, 2009).

Lexicographers have been avid consumers of Web data. For example, the Web-derived two-billion-word Oxford English Corpus was built to support dictionary development and to monitor the evolution of English. The University of Leipzig's Wortschatz-Portal has compiled online-searchable lexica and downloadable corpora for 57 languages (<http://wortschatz.uni-leipzig.de/>). For German this portal offers a free API to obtain detailed lexical, morphological, syntactic, and semantic information, as well as examples of usage for any given word form. Specialized aids for translators, writers, and language learners would be easy to develop with this service. Web data can also support bilingual lexicography: Ferraresi, Bernardini, Picci, and Baroni (2008) show that typical collocations found in large independently-compiled corpora of English and French can assist lexicographers in revising a bilingual dictionary.

A Web crawl can also target only a specific site or set of sites. For example, Gutenberg.org, Wikibooks.org and other eBook sites are unrestricted sources of literary, academic, and general-interest texts. Many media companies have online archives of articles and transcripts which can be crawled; the most impressive compilations from such sources are Mark Davies's *Time* Corpus and Corpus of Contemporary American English (<http://corpus.byu.edu/>). For languages with few NLP tools available, crawling sites with high-quality text can provide the data for producing them; for example, to develop a lexicon and PoS-tagger for Bengali, Ekbal and Bandyopadhyay harvested a Web corpus from the archives of a single newspaper (2008).

To develop translation aids, Web sites with multilingual content can be mined for parallel corpora. WeBiText.com has compiled a "translation memory" of searchable parallel texts in 30 languages, mainly from EU and other government sites (Désilets, Farley, Patenaude, & Stojanovic, 2008); SERPs show translation equivalents in context. Linguee.de targets a single language pair, German-English, and draws on corpora from a wider range of bilingual sites spanning most content areas; SERPs highlight equivalent terms and indicate level of confidence in their accuracy based on quality of the sources and user ratings. Of course, as Jiménez-Crespo (2009) demonstrates, human-translated sites also are subject to strong influence from the source language. Consequently, corpora with comparable content drawn from similar sites in different language areas may be preferable to parallel corpora in which one text is inevitably translated. For a study of language and culture in Italy and the UK as reflected in the phraseology of agritourism, Manca (2008) compiled monolingual comparable corpora from sites in both countries; the contrasts her analysis reveals would not have emerged as clearly from translated texts.

Such investigator-compiled Web corpora remain orders of magnitude smaller than the SEs' databases. To stimulate research, Google has released data from two sets of Web corpora, one of over a trillion tokens of English, the other of around 100 billion tokens, in 10 other European languages. One prototype project, Linggle, enhances Google's data with PoS tags and supports search in this vast dataset by wildcard and wild-PoS, or both, to identify recurring collocations (Chang, 2008); for example, **/a beach* returns collocations of *adjective beach* by actual frequency (not document frequency) in Google's database. Wu, Witten, and Franken (2010) describe a much more ambitious ongoing project to combine filtered Google data with text examples from the BNC in a variety of English learning activities. Another application finds an approach to detecting real-word spelling errors (e.g., mistaken *there* for *their*) based on Google's datasets more effective than other spell-checkers (Islam & Inkpen, 2009).

Copyright

Copyright issues remain a gray area in compiling and distributing Web corpora. In principle anything found on the Web is copyright and therefore subject to control by its author. Free

access to Web content does not imply the right to download, retain, reprocess, and redistribute it. A small percentage of Web pages do explicitly permit reuse and redistribution under Copyleft or Creative Commons license; Yahoo! and Google both support searching only such pages. Obtaining permission from all copyright holders to reuse texts from a large Web crawl borders on the impossible. The interpretation of international copyright law varies widely by country, ranging from unrestricted use for research purposes to “no use is fair use”; Hemming and Lassi (*n.d.*) discuss the issues without resolving them. The labor-intensive nature of postprocessing data from a Webcrawl, and the need of investigators to share data for verification and replication of their results by other researchers, argue for redistributing Web corpora even if it entails some legal risk.

Trends in Web Corpus Development

The Web as corpus community continues to grow in size and productivity. The Association for Computational Linguistics Special Interest Group on Web as Corpus (SIGWAC) organizes annual workshops which attract both corpus linguists and NLP researchers. Web data are increasingly prominent in papers in other related fields as well. To the enormous benefit of corpus linguists, the SE industry’s research agenda overlaps significantly with their own. Investigators from the major SEs regularly publish papers with insights from their research on Web-scale data, and the industry also supports the development of open-source software which scales better to corpora with billions of tokens than do traditional database systems. This software includes Lucene, a powerful full-text SE, and Hadoop, a framework to distribute processing of data-intensive applications over many PCs, as well as more specialized tools based on them like Mahout, a distributed machine-learning library for document clustering (identifying similar documents) and classification (assigning documents to predetermined categories). The ability not only to compile but also to process, store, manage, and uncover meaningful patterns in huge datasets benefits investigators and end users alike.

Corpus Analysis of Written English for Academic Purposes

AVERIL COXHEAD

Corpus-based research and English for academic purposes (EAP) have a close relationship. In his editorial for a special issue on EAP and corpora in the *Journal of English for Academic Purposes* Thompson (2007, p. 285) explains this connection: "Corpora, at one level, are sources of evidence about language use, and permit a wide range of analyses of how language is used in different registers, contexts, and by different users." The term EAP covers a wide range of second or other language teaching and learning, including preparation for university studies, support courses for undergraduate second language learners already enrolled in university, and preparation for postgraduate studies to doctoral level. In this entry, we look at how corpus analysis of written texts provides evidence of language in use for EAP and informs dictionary design, materials development, testing, and curriculum design.

Types of Written Corpora for EAP

Various types of written academic corpora have been developed for EAP. Some are larger and more general in nature, while others are smaller and more specific. A corpus might contain samples of all written materials students could be expected to encounter at university. For example, the TOEFL 2000 Spoken and Written Academic Language Corpus (T2K SWAL) (see Biber, 2006) contains written materials such as university textbooks, course reading materials, web pages, and catalogues. Another corpus might contain texts from one particular subject area (see Flowerdew, 2004; Nesi, 2008).

While these corpora contain material that students might be expected to read, they might not contain materials that students need to write (Nesi, 2008). A problem related to EAP student writing is what learners should aspire to in their writing. Should we use corpora of professional writers as models for these writers, or perhaps highly proficient university level first-language (L1) or second-language (L2) student writers, or both? Examples of written corpora of highly proficient writers include the British Academic Written English (BAWE) corpus (Nesi, 2008) and the Michigan Corpus of Upper Level Student Papers (MICUSP) (English Language Institute, University of Michigan, *n.d.*). BAWE contains over 2,700 texts from undergraduate and postgraduate students writing in 35 university subject areas in the UK. MICUSP contains approximately two million running words of A grade final degree papers by undergraduate and postgraduate writers in the USA. Both corpora are freely available to researchers, EAP teachers, and students. MICUSP has a searchable online interface.

Some corpora contain writing from non-native writers. These collections are called learner corpora and are used to find out more about the language used in particular contexts by language users themselves. Learner corpora allow comparisons between L2 and L1 writers, as well as between L2s and other L2s. A benchmark learner corpus is the International Corpus of Learner English (ICLE), a corpus of writing by intermediate to advanced learners of English. The first version of this corpus was developed in 2002. A new version

is now available (Granger, Dagneaux, Meunier, & Paquot, 2009). It contains 3.7 million words of writing from English-as-a-foreign-language learners from a variety of languages, including for example Czech, Dutch, French, German, Chinese, and Japanese. Gilquin, Granger, & Paquot (2007) call learner corpora the “missing link in EAP pedagogy” and outline the potential of research in this area to benefit both teachers and learners.

Corpus Analysis of Language in Use for EAP

In this section, we will look at grammatical and lexical analyses of written corpora for EAP.

Grammatical Analysis of Corpora for EAP

A common question in EAP is what grammatical structures should teachers and learners focus on? That is, what grammatical features typify academic prose? In a large, well-conducted, and complex study, Biber and his colleagues (Biber, Johansson, Leech, Conrad, & Finegan, 1999; see also Biber, 2006) compiled the Longman Spoken and Written English corpus of approximately 40 million words of British and American English which included texts in conversation, fiction, news, and academic prose. They found, for example, that nouns far outnumber any other word class in this corpus of academic prose. Biber (2006) categorizes nouns in different academic disciplines in textbooks and classroom language, and finds differences in textbook language across disciplines. Biber (2006, p. 49) uses an example of a university textbook passage and illustrates how verbs in the written text serve “to connect long and complex noun phrases, which convey most of the new information in the passage.” This information can help teachers and learners to decide what kind of texts to select for reading in class and whether to spend time on text attack skills to help unpack long and complex noun phrases in reading, and to think about how writers’ own texts might be constructed to embody the grammatical structures of academic written English.

Vocabulary in EAP Corpora

Vocabulary is another area of research activity that combines EAP and corpus-based studies. The Academic Word List (AWL) (Coxhead, 2000) is an example of written corpora analysis using a wide range of academic subject areas and a variety of academic materials. It was primarily made for EAP teachers as part of a university preparation programme or for students working independently. On average, the AWL covers around 10% of the words in an academic text, compared to 1.4% in fiction. The AWL has spawned a host of EAP teaching materials and has been used by test developers.

Corpus analysis can also help us find out about common collocations of words. For example, the written academic corpus used to develop the AWL shows us that *analysis* and *of* have a strong relationship. In the sentence “several implications flow from *the previous analysis of* Swedish and Canadian approaches to gender equity” (emphasis added), the target word “analysis” is followed by “of” and then a noun phrase. Other examples show that nouns which follow “analysis of” include *interaction, language, system, programme, the effect, the changes, and data*. This relationship between *analysis* and *of* goes both ways. That is, we can have *analysis of* as well as *of analysis*. *Of analysis* often occurs in patterns such as *method/unit type/level of analysis*. Another example is *analysis and/or analysis*. The collocates for these patterns are quite different. Examples of *analysis and* collocates include *assessment, evaluation, interpretation, management, and results*. Examples of *and analysis* collocates include *description, data collection, and representation* (Coxhead & Byrd, in press).

Multi-Word Units in Written Academic Corpora for EAP

When we look wider than collocations, we can see patterns or sequences in word use where vocabulary and grammar come together. That is, the use of a particular word requires the use of a specific grammatical form (see Biber et al., 1999). These combinations of words and grammar are called “lexicogrammatical patterns” or “multi-word units.” Academic written English, according to Coxhead and Byrd (2007, p. 134),

has characteristic extended sets of words that come in relatively fixed sequences and that are likely to be stored in memory as sets rather than created word-by-word for each use—examples include four-word sequences like those reported in Biber et al. (2004) [see Biber, 2006] in an examination of phrases such as *the extent to which*, *as a result of*, *at the end of*, and *it is possible to*.

Corpus tools can highlight or draw out these patterns from texts. Some patterns appear to be more like phrases, such as *on the other hand* and *at the same time*, in which the words seem relatively fixed. Other patterns have a more open structure, where a word can be substituted but the same basic pattern remains, as in *it is _____ to*, and *it is possible to/it is important to/it is necessary to*.

Research has analyzed characteristic patterns or lexical bundles for a variety of academic communicative types and purposes. For instance, Biber and colleagues (Biber, Conrad, & Cortes, 2004) analyzed lexical bundles in classroom teaching and textbooks. Hyland (2008) analyzed a written corpus of samples of published writing, student writing in dissertations, and master’s theses to investigate differences in lexical bundles among disciplines. He found that electrical engineering contained the greatest number of lexical bundles in his corpus, while biology contained the fewest (p. 9). Learner corpora research has brought to light some interesting findings on the use, misuse, or nonuse of particular lexical items by native and non-native English writers. Paquot (2008), for example, reported on a cross-linguistic study of exemplification in writing by learners with five different language backgrounds. She found that a writer’s first language can affect their use of multi word units and that writers can make errors with these units at the function, frequency, and register levels. Corpora can tell us how the same words are used differently in different contexts. It is important for EAP learners and teachers to understand this new information on variation in academic texts.

Applying Corpus Analysis to Dictionary Design, Materials Development, Testing, and Curriculum Design in EAP

Dictionaries have increasingly incorporated results from corpus analysis. A recent example is the use of a learner corpus to inform the development of a learner dictionary (Gilquin et al., 2007). This dictionary takes an example of learner writing that contains an error, explains the problem, and provides information on meaning, use, and corrections. Other dictionaries include common collocations, frequency-based information on words, and examples from L1 and L2 academic corpora to exemplify language in use.

Academic writing research is a rich area of collaboration between written corpora and materials development. An early example is Thurstun and Candlin’s (1997) *Exploring academic English*. This groundbreaking workbook focuses on a small number of words such as *research*, *analysis*, and *probably*. It uses corpus results to illustrate the meaning and use of these words in authentic written academic texts. Activities direct the reader to notice and analyze target words in concordances. Opportunities are given to use the words in writing on academic topics. Another example is Thompson and Tribble’s (2001) analysis

Table 1 From kibbitzer 77, Tim Johns

This kibbitzer is based on a summary by a Greek-speaking postgraduate student of physiology:

Original	Revision
In the early stages of an acute inflammatory immune response, neutrophils predominate the phagocytic cell species recruited to the site.	In the early stages of an acute inflammatory immune response, neutrophils predominate among the phagocytic cell species recruited to the site.

As shown by citations [below], *predominate* is not a transitive verb: it cannot be followed by an object, but can be followed by a prepositional phrase constructed with *among*, *in*, *over*, etc.

- 1 This version still *predominates* among Roman Catholic laity.
- 2 ... trees such as the dipterocarps, which *predominate* in primary rainforest in ...
- 3 Yet the colours and shapes that *predominate* in any one place seem to bear ...
- 4 ... the class of antibody that *predominates* in blood ...

of citation in academic texts and EAP textbooks. These materials include suggestions for using corpora in EAP classrooms to investigate citation in texts related to students' areas of academic interest using readily available word processing software.

Tim Johns, an early adapter of corpus linguistics and the originator of the term "English for Academic Purposes," developed "kibbitzer" pages that use samples of language from EAP corpora to illustrate the meaning and use of words and phrases in context. (A "kibbitzer" is an interested observer. See <http://www.eisu.bham.ac.uk/support/online/kibbitzers.shtml>.) Table 1 is adapted from kibbitzer 77 on "predominate":

The kibbitzer then illustrates how *predominate* contrasts with *dominate*, using concordance lines as examples. Unfortunately these kibbitzer pages are no longer readily available online, but they were instrumental in the data-driven learning trend in EAP. Römer (2009) finds that teachers want and need more such data-driven learning materials to inform classroom practice, and that corpus-driven materials need to be incorporated into language programmes.

Corpora studies now play a role in test development, for example in vocabulary, in comparisons of lower-level and higher-level proficiency for L2 writers, and in grammaticality. Hunston (2002, p. 212) states that learner corpora render the basis of assessment "explicit" in that the corpus sets the standard for the learner language comparison, and "realistic" in that the corpus contains authentic language in use.

Increasingly, the literature reports on EAP students being introduced to corpus-based studies to supplement their language programmes. One major benefit is the increased level of responsibility students feel for their own writing. Yoon (2008, p. 45) states,

Corpora are tools that allow students to solve their linguistic and writing problems independently, and they raise students' linguistic awareness through problem-solving with authentic texts.

Starfield (2004) identifies language development, student empowerment, and engagement with authoritative English resources as benefits of corpus use by PhD students in a writing course.

Corpus analysis by novice second-language academic writers has students compiling their own specialized corpora for analysis (Lee & Swales, 2006). These writers describe this approach as “decentering” (p. 71) because

it allows non-native speakers a chance to make their own discoveries about what is “done” in the language, instead of relying on native-speaker intuitions, or grammar/style books; it typically involves texts from a variety of different writers/speakers (not all of whom are necessarily native speakers), instead of just one native-speaker teacher standing in front of the classroom.

EAP learners and teachers can now access a wide range of online tools for investigating written academic corpora. Tom Cobb’s (*n.d.*) website, the Compleat Lexical Tutor, has a concordancing program that allows learners to search single target words and phrases in their own writing and compare their use with written EAP corpora. It also has a grammatical comparison exercise where learners can correct a grammatical error either using their own knowledge or by checking concordance examples in a written corpus. In EAP classes, the present writer combines Johns’s and Cobb’s ideas and has learners investigate L1 and L2 uses of target language features. They create worksheets for each other using their findings. Such exercises can encourage learners to notice patterns in language and provide an avenue to develop skills by editing their own written language.

In this entry we have looked at how corpus analysis of written academic texts sheds light on language in use, and informs teaching and learning. Teachers have tools that enable learners to develop a degree of independence and start solving their own real-world language problems in EAP and university studies.

Corpus Linguistics in Language Teaching

CASEY KECK

Corpus linguistics is an area of applied linguistics that uses computer technology to analyze large collections of spoken and written texts, or corpora, which have been carefully designed to represent specific domains of language use, such as informal conversation or academic writing. Since the early 1990s, researchers have become increasingly interested in applying the findings of corpus-based studies to second and foreign language education, and some (e.g., Conrad, 2000) have argued that corpus linguistics could revolutionize language teaching by fundamentally changing the way we approach materials design and curriculum development.

What Relevance Does Corpus Linguistics Have for Language Teaching?

Prior to the development of electronically stored corpora, it was not feasible to identify patterns of language use in, for example, American English conversation, as analyzing millions of words by hand was impossible to accomplish in a timely manner. Now, however, computer programs allow for automatic language analysis, and corpus-based findings have emerged which both enrich and challenge previous notions about language use. Specifically, the past few decades have seen an explosion in information available regarding (a) the frequency with which particular words or linguistic features occur in a language; (b) the ways in which lexis and grammar work together to create meaning; and (c) the ways in which situational factors, such as the mode and purpose of communication, impact the choices we make as writers and speakers of a language.

Corpus linguistics has made a wealth of frequency information available to language teachers, and this information can play an important role in helping teachers to decide what is more or less important in a language classroom, depending on what is known to be more or less typical in actual language use (Biber & Reppen, 2002). For example, teachers who would like to know which phrasal verbs are used most frequently in English can consult corpus-based frequency lists (e.g., Biber, Johansson, Leech, Conrad & Finegan, 1999; Gardner & Davies, 2007). Teachers preparing university students for the demands of academic study in English-speaking universities can now find lists of the most frequently used academic words across disciplines (Coxhead, 2000), as well as lists of important multiword phrases used in university spoken and written discourse (e.g., Biber, Conrad, & Cortes, 2004).

Corpus linguistics research has also shown that lexis and grammar work together to create meaning, and this has fundamentally changed our understanding of what it means to “know” a word. While dictionaries and language teaching materials previously focused on providing word definitions, these resources are increasingly drawing upon corpus analysis tools to provide additional information about *collocation*, the tendency of words to co-occur with other words, and *phraseology*, the tendency of words to occur in particular grammatical patterns (Hunston, 2002). It has become clear that a word cannot be defined

in isolation, but rather, meaning is expressed through a combination of a word with other words and syntactic patterns. Corpus analysis tools, such as concordancing programs, allow teachers and students to view several examples of a key word in context and to study how this context impacts word meaning. These tools are particularly well suited for investigating the multiple senses of a single word, the subtle differences in the use of seemingly synonymous words, and the positive and negative connotations of particular phraseologies (Sinclair, 2005; Tsui, 2005).

Finally, corpus linguistics has shown teachers the importance of register and the ways in which language use varies according to the communicative demands of a given situation. Registers can be defined quite broadly (e.g., writing, as a general register, could be compared with speaking), or can be quite specialized (e.g., one could study the register of *New York Times* editorials). As Conrad (2000) notes, it no longer makes sense to offer students “monolithic” descriptions of the language they are studying: The choices we make regarding our use of particular words, phrases, and grammatical structures is largely determined by the context of communication. For example, the real-time pressures of conversation can help to explain its frequent use of contractions and pronouns, while the characteristics of writing (e.g., time for planning, the need to provide context for the reader) help to explain its frequent use of complex noun phrases (Biber et al., 1999). Because many language students experience a variety of registers in the target language (talking with friends, attending university classes, giving presentations at work), it is important for teachers to understand how language use varies across these contexts and to highlight important register differences in their classroom teaching.

Corpus Linguistics in the Classroom: Options for Language Teachers

Teachers who are interested in applying corpus linguistics in their own classrooms have a number of options available to them. Teachers who are just beginning to learn about corpus linguistics themselves, or who do not feel they have enough time or resources to devote to corpus activities, can nevertheless draw upon a variety of corpus-based resources when planning lessons and designing materials, including corpus-based dictionaries, grammars, and language textbooks (McCarthy, 2008). Teachers can also take a more critical approach to evaluating existing language teaching materials, keeping in mind issues that corpus linguists have emphasized as important: *frequency* (e.g., when selecting target vocabulary); *collocation and phraseology* (e.g., teaching not only word meaning, but also important collocates and syntactic patterns); and *register variation* (e.g., highlighting key differences in the use of a particular feature in speaking and writing).

A number of online tools also make it possible for language teachers to analyze collections of texts they plan to use in their classroom, to assess the difficulty of these texts, and to investigate how vocabulary words are recycled across an entire instructional unit (Cobb, 2007). Teachers can also consult a variety of online corpora when preparing lessons and materials. For example, the Corpus of Contemporary American English, or COCA (www.american corpus.org), allows teachers to search not only for key words, but also for synonyms, important collocates, and grammatical patterns. The Michigan Corpus of Academic Spoken English, or MICASE (<http://micase.elicorpora.info>), allows users to generate concordance lines and to download entire transcripts of speech events, such as class lectures, student presentations, and study group sessions.

In addition to consulting corpora themselves, teachers also have the option of introducing corpora to their students. Flowerdew (2009) notes that students could benefit from explicit instruction on how to consult a wide range of corpus-based resources when investigating their own language-related questions. Teachers can also engage students in what

Johns (2000) refers to as *data-driven learning*, or the analysis of concordance lines that have been selected, arranged, and possibly edited by the teacher to draw learners' attention to patterns of language use. Building on Johns's ideas, a number of researchers (e.g., Aston, 2001; Bernardini, 2001) have advocated a *discovery learning* approach, where students, not teachers, take primary responsibility for searching and analyzing corpus data. These researchers argue that discovery learning, unlike teacher-directed activities, empowers learners to challenge textbook explanations and native-speaker intuitions and to make discoveries about language use that, without the use of corpora, would not have been possible.

The use of corpus data in the classroom is not uncontroversial, however, as others have expressed skepticism concerning the relevance of corpora for language teaching. In some cases, corpus data, when divorced from its original context, may serve to confuse students, rather than help them to learn about the language (Widdowson, 2002). The use of both learner corpora (see, e.g., Granger, 2002; Seidlhofer, 2000) and small, specialized corpora (see, e.g., Gavioli, 2001; Lee & Swales, 2006; Romer, 2010) may help teachers to design language analysis activities that engage students in explorations of texts that are more immediately relevant to their own lives.

Conclusions

Corpus linguistics has fundamentally changed our understanding of language use, and this, in turn, has led to changes in how we approach language education. Over the next few decades, it is likely that corpus-based findings will continue to inform the development of language teaching materials. The use of corpora in the classroom is also likely to increase, as teachers and students are given greater access to online corpora and text analysis tools. The major question to be explored is no longer "What relevance does corpus linguistics have for language teaching?" but rather "How can teachers and students most effectively make use of the corpus-based resources available to them?" Continued exploration of the use of corpora in a wide range of classroom contexts will no doubt help to refine our understanding of the variety of ways in which corpus linguistics might be applied to language pedagogy.

Corpus Linguistics: Historical Development

SUSAN HUNSTON

Origins

A number of features characterize corpus linguistics. It uses a collection of texts that have occurred naturally and are stored on a computer. Software is then used to manipulate the texts so that they can be examined in ways that are different from reading them in a linear fashion. These characteristics can be explored further to explain the origins of corpus linguistics. Although corpus linguistics might be said to have begun in the 1960s, many of its key assumptions were by that time already part of the linguistic tradition.

There is a long history of fieldwork in linguistics in which examples are collected to illustrate how language is used. Francis (1992) cites lexicographers and grammarians among linguists who routinely collected samples of language in actual use. For example, to compile the Oxford English Dictionary, dozens of volunteers were set to work reading books, newspapers, and other sources to identify the origins and uses of specific sets of words. Jespersen was among grammarians who regularly noted down examples he encountered to illustrate a grammar of English (Jespersen, 1909–49), while Fries compiled a collection of transcribed telephone conversations as the source material for his grammar (Fries, 1952). The later Survey of English Usage project, headed by Quirk, adopted a more systematic approach, collecting samples of written and spoken English from a variety of situations to describe the English of educated, London-based speakers (Quirk, 1960). In many ways, then, for people whose concern was to describe a language, the development of electronic corpora was a natural and welcome extension to their existing activity. Computers made it possible to collect much larger quantities of text and to process it much more quickly than a manual analysis could.

The tradition of manipulating data is even older. For example, concordances of the Christian Bible have been produced manually since the 13th century (Anthony of Padua, exact date unknown). These concordances select all instances of a given word and cite the phrases or sentences in which they occur. This is partly a convenient indexing device, but it is also designed to demonstrate the meaning of words of religious significance (such as *lamb* or *covenant*) by showing the surrounding text in all places where they occur. The manually-constructed concordances are a direct precursor of the concordancing programs used in corpus linguistics.

Journals and Conferences

The oldest journals devoted specifically to corpus linguistics are the *ICAME News*, first published in 1979 and replaced by the *ICAME Journal* in 1987, and the *International Journal of Corpus Linguistics*, first published in 1996. Two later journals are *Corpus Linguistics and Language Theory* (first volume 2005), and *Corpora* (first volume 2006). Journals with a more general interest in computational applications to humanities, linguistics, and literature are

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

2 CORPUS LINGUISTICS: HISTORICAL DEVELOPMENT

Computers and the Humanities, first published in 1966, and *Literary and Linguistic Computing*, first published in 1986.

There are now dozens of regular or occasional corpus linguistics conferences, held in as many countries. ICAME (the International Computer Archive of Modern and Medieval English), founded by Francis, Johansson, Leech, Sandved, and Svartvik, hosted what was probably the first such conference in 1979. Apart from that, the earliest corpus linguistics conferences focused on applications, with the first Teaching and Language Corpora (TALC) conference in 1994, the first Practical Applications of Language Corpora (PALC) conference in 1997, and the first conference of the American Association for Applied Corpus Linguistics (later renamed as the American Association for Corpus Linguistics) in 1998.

Corpora

In one sense, the history of corpus linguistics is the history of a series of objects—corpora. The first corpus to be given that name was the Brown Corpus, developed by W. Nelson Francis and Henry Kučera (at Brown University) and released in 1964. It consisted of texts amounting to one million words (or “tokens”). The corpus was not simply collected, but was designed, with the aim of being representative of written American English. To achieve this, a single year of publication was chosen—1961—and 15 categories were established (Francis and Kučera, 1982). These included six categories of fiction, two separate categories of newspaper texts (“reportage” and “editorial”), and an academic category subdivided into subject areas (“Natural Sciences,” “Mathematics,” and so on). There was a concern to have as wide a spread of texts as possible, so samples of 2,000 words were taken from each of 500 individual texts. This meant that no long texts took up a disproportionate amount of the total corpus size (so the corpus was not “skewed”), but it also meant that only a small part of each long text was included.

The Brown Corpus was important for many reasons. It was made widely available, and it introduced the concepts of representativeness and balance; many subsequent corpora used the same categories and followed the same principle of sampling texts. This made it possible to make direct comparisons between corpora. In addition, during the 1970s the Brown Corpus was “tagged,” that is, each word (“token”) in the corpus was given a code indicating its word class (“adjective,” “plural noun,” “comparative adverb,” and so on). This made it possible, for example, to calculate the total number of adjectives in each part of the corpus, or to establish which nouns were most frequent. Although the principles of text sampling and of tagging were challenged subsequently (e.g., Sinclair, 1992), they have remained very common in the compilation of corpora.

Johansson (2008, pp. 34–5) points out that although many developments in corpora during the 1960s and 1970s involved English (he attributes this partly to the wide availability and principled design of the Brown Corpus), the early development of corpus linguistics was characterized by its international aspect. Universities and research centres in Britain, Canada, France, Germany, Italy, Norway, Sweden, and the USA contributed to early corpus-building. There were a number of joint projects. For example, a collaboration between the universities of Lancaster, Oslo, and Bergen headed by Johansson and Leech produced the LOB corpus of written British English in 1976. This used the same sampling technique and the same text categories as the Brown Corpus, and was the same size.

After these early corpora of English in the 1960s and 1970s, corpora developed in a number of ways. They grew in size as computer capacities increased. For example, the Bank of English Corpus, which was used as the basis for Sinclair, Hanks, Fox, et al. (1987), was at that time just under 20 million tokens in size, but about 20 years later comprised nearly 650 million tokens. The tradition of a large, balanced corpus that is representative

of a language variety developed into the concept of a “national” corpus. The first of the “national” corpora was the British National Corpus, begun in 1991 under the direction of Burnard and Leech, and released in 1994. Whereas Brown and LOB had each consisted of one million tokens, the BNC was many times larger, 100 million tokens, and this size became the standard for national corpora. As well as many kinds of written English, it included unpublished written material, such as letters, and a large amount of transcribed spoken language, obtained in part from a demographically selected cross-section of (English-speaking) British society. Xiao (2008) cites a large number of national corpora, many following similar design criteria to the BNC, existing or under construction: Chinese, Czech, Danish, Dutch, French, German, Greek, Hungarian, Irish, Italian, Korean, Maltese, Norwegian, Polish, Russian, Slovak, and US English.

After the 1960s, however, corpora did not simply get larger but also developed in other ways. There was a rapid growth in corpora consisting of specific kinds of text. These included historical corpora tracing the development of a language, parallel corpora comparing two languages, as well as, for example, corpora of news texts, or 19th-century fiction, or casual conversation, or academic writing. Many if not most of these specialized corpora were built to make possible comparisons between forms of a language, such as between different centuries, between different social settings, or between different professional groups. New publishing practices made it possible to access texts electronically, avoiding the need to scan or keyboard texts. The growth of the Internet made huge quantities of electronic text available, and the World Wide Web itself formed a kind of megacorpora (Bergh & Zanchetta, 2008). It became possible for an individual with very limited resources to make corpora of material available electronically. As a result, corpus-building moved from the exclusive domain of the large research project to the desk of the individual researcher. Specialized corpora extended to include electronic forms of written language such as e-mails, text messages, and blogs. The digital recording of sound and of visual images reduced the dependency of corpora on the written representation of language, and made it possible to build corpora of signed languages (Schembri, 2008) and to link transcribed spoken corpora to sound files.

Annotation and Software

As noted above, one of the key features of the Brown Corpus was the “tagging” of the corpus, that is, the addition of a word-class tag to each word in the corpus. Part-of-speech (PoS) tagging is done automatically, that is, using a computer program rather than a human being, but in some cases the tagging is subsequently edited, as automatic tagging is not completely accurate.

PoS tagging is only one kind of corpus annotation, and one aspect of the history of corpus linguistics is the development of new forms of annotation, and the extensive work that has been carried out to improve the accuracy of automatic annotation. A natural successor to PoS tagging was syntactic annotation, which provides a grammatical parse of each clause. Because it is more difficult to achieve accuracy in parsing than in tagging, “treebanks” were developed to assist this (Leech & Eyes, 1997). Treebanks are parsed corpora whose accuracy has been improved by human editing. Parsing programs can be calibrated against the known correct treebanks to improve their accuracy. More sophisticated kinds of annotation include allocating categories relating to intonation, meaning, or specific sets of items such as reported speech or thought (Garside, Leech, & McEnery, 1997). In corpora of language produced by learners, errors may be tagged.

Annotation has a number of advantages (Leech, 1991). It makes it easier to distinguish between the various uses of words that are ambiguous, such as “right ≠ left” and “right

≠ wrong.” It also allows more abstract information to be extracted from a corpus, as frequencies can be given for classes of items, whether grammatical, semantic, or pragmatic, as well as for individual words. A drawback to annotation and the abstractions derived from it is that abstractions necessarily draw on a particular theoretical approach, and the researcher may be constrained to see in the corpus (only) that which the annotation makes salient (Sinclair, 1992).

Alongside developments in annotation has been a burgeoning of innovative kinds of corpus investigation software. Early software produced word frequency lists and concordance lines. This was followed by statistical information about strength of collocation and the comparative frequency of words in different corpora (Scott, 1996). Corpus investigation tools have always operated on tags as well as on words, and as annotation became more sophisticated they calculated the relative frequency of categories such as semantic classes, as well as of parts of speech (Rayson, 2009). With an increased interest in phraseology, software was developed to identify even variable and discontinuous phrases in a corpus (e.g., Greaves, 2009). It is clear that developments in software design mirror the more theoretical concerns of corpus linguistics. The focus on lexis and collocation is facilitated by concordancing and the measurement of frequency of co-occurrence. Scott’s work on identifying distinctive lexis both enables and encourages the exploration of specific discourses. As corpora have grown larger, software has developed that enables the individual researcher to manage very large amounts of data by producing abstracted material from it (e.g., Kilgariff, 2002). The software, then, mediates between the corpus and the user. At its best it does not replace engagement with the raw data, but provides a point of entry to the corpus, giving the researcher a rationale for investigating one set of items—words, phrases, or texts—from the millions of items that are present in the corpus.

Corpus Linguistics and Linguistic Theory

The history of corpus linguistics is a history of ideas as well as an account of corpus and software developments. In particular, it is evident that corpora have led to innovation in the way that languages are perceived. At the same time, because corpora have started to be used by so many people in different situations, it is arguable that “corpus linguistics,” as a separate, identifiable way of doing linguistics, may no longer be a defensible category.

Corpora have been used to refine both descriptions and theories of language, largely by quantifying linguistic features and linking those to social and other kinds of context. For example, the collection edited by Lindquist and Mair (2004) demonstrates that studies of language change have benefited enormously from the availability of historical corpora such as the Helsinki Corpus of English Texts, while collections such as Aijmer, Altenberg, and Johansson (1996) present studies comparing similar features in different languages. There are numerous studies of the comparative frequency of individual grammatical features, especially in English, which might be said to culminate in Biber, Johansson, Leech, Conrad, and Finegan’s (1999) survey of grammatical features in four contrasting corpora (news, academic prose, fiction, and conversation). Another set of studies deals with discourse categories such as conversational routines (e.g., Tottie, 1991; Stenström, 1994; Aijmer, 1996). Finally, there are many studies that distinguish between apparently similar words, of which Kennedy’s (1991) study of *through* and *between* is an early example based on one language, while Viberg’s (1996) study of English *go* and Swedish *gå* is a crosslinguistic example. What these studies have in common is the priority given to relative frequency and the importance of quantitative observations. Meyer (2002) points out that this places corpus linguists at odds with generative grammarians, and that Chomsky’s criterion of explanatory adequacy is unlikely to be met using corpus data alone. McEnery and Wilson (1996) argue that Chomsky’s views led to a hiatus in the development of corpus linguistics

during the 1950s.

Although corpus linguists often indicate that their work is intended to corroborate, extend, or resolve previous theoretical positions, a large body of work explicitly opens new areas of language theory and challenges preconceptions. For example, Biber (1988) proposes that language variation should be regarded as multidimensional rather than unilinear. He shows that texts from two different contexts, such as conversations and interviews, may be quantitatively similar if one set of features is taken into account, but quantitatively different if another set of features is used in the calculation. Sinclair's (1991, 2004) work on lexical items suggests that lexis and phraseology, not grammar, are central to the description of English, and that in fact lexis and grammar should not be regarded as separate areas of language description. Essentially he proposes a unit for the analysis of English—the “unit of meaning”—which represents a radical departure from previous linguistic theories.

In line with studies such as these, a distinction is often made between studies that take established categories or hypotheses as their starting point (sometimes called “corpus-based”) and those that aim to find new modes of description by taking a more open stance towards the corpus data (“corpus-driven”) (e.g., Tognini-Bonelli, 2001). An alternative way of conceptualizing trends in corpus linguistics is to distinguish between “broad-brush” and “fine-grained” language studies. These represent different ways of exploiting the potential of a corpus. Corpora are ideal for identifying general differences in the frequency of specific items in different contexts. Biber, Johansson, Leech, Conrad, and Finegan's (1999) comparison between four corpora, which quantifies features such as tenses, noun phrase modification, and adverbials in each corpus, is one example. The result is a series of broad characterizations of each of the corpora. Corpora are also, however, ideal for identifying details of the usage of individual words or phrases, as examples from a broad range of texts can be displayed together. Sinclair's theories, for example, come from very close attention paid to relatively few items.

A somewhat later trend in corpus linguistics is the use of corpora to enhance work which belongs to the field of discourse analysis or critical discourse analysis (e.g., Stubbs, 1996; Baker, 2006). Here the target corpus is tightly controlled to represent a very specific type of discourse, and the approach to analysis may involve studying individual texts as text, as well as searching the whole group of texts as a corpus. A frequently used technique is to identify what is “special” in terms of content or stance in the target corpus by identifying words and phrases which occur relatively more frequently in it than in a general corpus. Another is to examine the collocates and phraseology of items which are statistically or culturally significant in the target corpus, often to reveal ideological tendencies which may be hidden where only one text is read.

It was noted above that it has become relatively simple for any researcher or teacher to build and exploit a corpus. It is not surprising, therefore, that there is a growing debate as to what kind of a discipline corpus linguistics is, or indeed whether it is a discipline at all (Taylor, 2008). In a sense, “corpus linguistics” has been a victim of its own success. Corpora, and the techniques and methods associated with them, are now widely used in a number of fields, such as sociolinguistics, psycholinguistics, stylistics, or discourse analysis, where the quantitative results of a corpus search may be interpreted in the light of other evidence. In other words, the objects and techniques of corpus linguistics are no longer limited to people who use such tools exclusively, and, as such, the value of “corpus linguistics” as a distinguishing label might be said to have disappeared. On the other hand, the investigation of the uniquely-configured object that is a corpus cannot be reduced to a simple set of techniques for language description (Teubert, 2005). The impact of corpus linguistics on language theory itself remains its most important contribution, and for that reason alone the name deserves its place in the history of linguistics.

Corpus Linguistics: Quantitative Methods

STEFAN TH. GRIES

Introduction

Ever since technological development has made it possible to search large corpora in a very short time, corpus linguists have done a lot of interesting work in linguistics in general, and in applied linguistics in particular. Given both a large interest of corpus linguists in lexicographic applications and the fact that words are among the linguistic elements most easily recoverable (in the usual suspects of well-researched Indo-European languages at least), most corpus-linguistic work until now has been concerned with words and/or *n*-grams (i.e., sequences of words), their distribution with regard to other words, and their distributions across different modes, registers, genres, varieties, and so forth.

More recently, however, the situation has changed and corpus-linguistic research has begun to address many more syntactic phenomena. While this is to some extent due to the increased availability of syntactically annotated corpora, it is also due to corpus linguists' and many cognitive linguists' adoption of the assumption that syntax and lexis are not qualitatively different (see Hunston & Francis, 2000, or Hoey, 2005, in corpus linguistics and Langacker, 2000, or Goldberg, 1995, 2006, in cognitive linguistics). Only recently, however, have words and syntactic patterns, or constructions, been treated on a par not only *theoretically*, but also *empirically*. One example is the application of association measures that are usually applied to co-occurrences of words (aka collocations) to the co-occurrences of words with syntactic patterns. This approach is referred to as *collostructional analysis* (a blend of *collocation* and *construction*), and three different kinds of applications have been proposed:

- **collexeme analysis**, which quantifies the degree of attraction or repulsion of words (typically verbs) to a syntactically defined slot in a construction (see Stefanowitsch & Gries, 2003), for example: how much does *give* like to occur in the ditransitive?
- **distinctive collexeme analysis**, which quantifies which words (typically verbs) are attracted to or repelled by one of several constructions (see Gries & Stefanowitsch, 2004a), for example: how much does *give* prefer to occur in the ditransitive as opposed to the prepositional dative?
- **covarying collexeme analysis**, which identifies preferred and dispreferred pairs in two slots of one construction (see Gries & Stefanowitsch, 2004b), for example: the two verb slots in *He tricked her into marrying him*.

These methods have been applied in a variety of domains and languages including constructional senses and complementation patterns, syntactic alternations of a variety of constructions, verb-specific syntactic priming effects, and so forth. In this article, applications of distinctive collexeme analysis to data from second-language learners of English will be discussed briefly.

Table 1 Frequencies of *give* in ditransitive and prepositional datives in the ICE-GB (from Gries and Stefanowitsch, 2004a, p. 102)

	<i>Ditransitive</i>	<i>Prepositional dative</i>	<i>Total</i>
<i>give</i>	461	146	607
Other verbs	574	1773	2,347
Total	1,035	1,919	2,954

Distinctive Collexeme Analysis

Like nearly all corpus-linguistic association measures, distinctive collexeme analysis is based on a two-by-two co-occurrence table such as Table 1, which exemplifies how the lemma *give* is distributed across ditransitive and prepositional datives in the British component of the International Corpus of English (ICE-GB).

In collostructional analysis, the association measure used most frequently to evaluate such tables is the negative log to the base of 10 of the $p_{\text{one-tailed}}$ -value of a *Fisher–Yates exact test*. Using the open-source programming language and environment R (see R Development Core Team, 2010, available from <http://cran.at.r-project.org/>), this measure can be computed easily as follows (when the observed frequency in the upper-left cell is larger than the one expected by chance, i.e., $607 \cdot 1035 / 2954 \approx 213$):

```
607*1035/2954 # expected frequency¶
[1] 212.6760
- log10(sum(dhyper(461:607, 1035, 1919, 607))) # - log10 p-value¶
[1] 119.7361
```

Line 3 of the above code computes the negative log to the base of 10 ($-\log_{10}$) of the sum (sum) of all probabilities from the hypergeometric distribution (dhyper) from the observed frequency of 461 to the theoretically possible extreme of 607, given that the data contain 1,035 ditransitives, 1,919 prepositional datives, and 607 instances of *give*. (Such computations can be performed automatically with a script available from <http://tinyurl.com/collostructions>.)

If the observed frequency of the cell of interest is less than the expected one (as it is here for the occurrence of *give* in the prepositional dative), this formula changes to the following, which computes the negative log to the base of 10 ($-\log_{10}$) of the sum (sum) of all probabilities from the hypergeometric distribution (dhyper) from the observed frequency of 146 to the theoretically possible extreme of 0, given that the data contain 1,919 prepositional datives, 1,035 ditransitives, and 607 instances of *give*:

```
- log10(sum(dhyper(0:146, 1919, 1035, 607))) # expected frequency¶
[1] 119.7361
```

Analogous tests can be done for all verb or lemma types occurring at least once in either the ditransitive or the prepositional dative, and then these verb lemmas can be ranked according to the strength of their attraction or repulsion to the two constructions (an interactive R script for this offering different measures of association strength is available from the author). The verbs that are most strongly attracted to the ditransitive and the prepositional dative are listed in (1) and (2) respectively (listed in decreasing strength of association strength).

1. *give, tell, show, offer, cost, teach, wish, ask, promise, deny, award, grant, cause, drop . . .*
2. *bring, play, take, pass, make, sell, do, supply, read, hand, feed, leave, keep, pay . . .*

Such results are interesting because they provide strong support for analyses of the two constructions that invoke different constructional senses. For example, the ditransitive has been argued to involve constructional senses of transfer, enablement of transfer, non-enablement of transfer, communication as transfer, and others. In addition, they are also compatible with what is known about the two constructions' acquisition patterns (where, for example, *give* is a path-breaking verb for the acquisition of the ditransitive).

While many analyses of this kind were targeted at argument-structure constructions, other less semantically loaded constructions have exhibited similar verb-specific effects; examples include *will*-future versus *going to* V (see [3]), particle placement (see [4]), or *to* versus *ing*-complementation (see [5]).

3. a. He will mess it up.
b. He is going to mess it up.
4. a. He will mess up the whole talk.
b. He will mess the whole talk up.
5. a. He tried to mess up everything.
b. He tried messing up everything.

This collostructional approach has returned interesting and new results regarding many of the above constructions and others, and there is even experimental evidence from sentence-completion and self-paced reading tasks that indicates that the behavior of native speakers of English can sometimes be predicted better on the basis of association strengths than on the basis of raw frequencies or conditional probabilities (see Gries, Hampe, & Schönefeld, 2005, 2010).

Applications

The above kind of corpus-based measurement of association strengths has many interesting implications and applications. For example, there is an increasing body of evidence that shows that children and adults are very sensitive to distributional patterns in language: infants less than a year old can notice statistical co-occurrence patterns in their ambient language; language change is strongly correlated with the frequencies of words and syntactic patterns; and linguistic representation and processing exhibit frequency and conditional-probability effects. Therefore, the computation of probabilistic associations between different linguistic elements can inform many aspects of theoretical linguistics, but also applied linguistics. The following two sections discuss how such corpus-based methods can also be correlated with experimental data and show, here for second and foreign-language learners, how the corpus-based association strengths help to reliably predict second-language learners' experimental priming responses.

Ditransitive Versus Prepositional Datives

Gries and Wulff (2005) performed a sentence-completion task in which the results of Gries and Stefanowitsch's (2004a) distinctive collexeme analysis, parts of which were listed in (1) and (2), were correlated with the results of a sentence-completion priming experiment with German learners of English (mean number of years of English instruction: 11.1 years). In that experiment, the subjects were presented with sentence fragments of two kinds in an alternating fashion: sentence fragments that suggested a particular completion (as in [6]), followed by sentence fragments that did not (as in [7]).

6. a. The racing driver showed the helpful mechanic . . . [suggests a ditransitive]
 b. The racing driver showed the torn overall . . . [suggests a prepositional dative]
7. The racing driver showed . . . [does not suggest a specific constructional completion]

The question was whether subjects' completion of a fragment of the type in (6) would prime them to complete the fragment of the type in (7) with the same construction, and the learner subjects did exhibit such a significant priming effect. More interestingly in the present connection, however, is the fact that the subjects exhibited different priming effects for different verbs: the subjects were significantly more likely to be primed for ditransitives when the sentence fragment ended in a verb that the distinctive collexeme analysis of the native English speaker identified as preferring the ditransitive, and vice versa. Even more interestingly, Gries and Wulff also showed that this significant correlation between native-speaker corpus preferences and learner experimental preferences cannot be reduced to the English verbs' translational equivalents in German.

Similar evidence was obtained by Wulff and Gries (in press) on the basis of (German and Dutch) learner corpus data from the International Corpus of English (ICLE; Granger, 1993). They found a highly significant correlation between native-speaker corpus preferences and learner corpus preferences.

In sum, for the alternation of ditransitives and prepositional datives, different studies using the collostructional approach revealed that the two constructions exhibit markedly different preferences for different verbs, which in turn correlate with cognitive-linguistic accounts of the two constructions and their sense extensions, and these preferences are robust across native speakers and learners, and across experimental and observational data.

to-Versus *ing*-Complementation

In a similar set of case studies, Gries and Wulff (2009) studied the two complementation patterns exemplified in (5). They first conducted a distinctive collexeme analysis of the two constructions in native-speaker corpus data to identify which verbs they prefer. They found that the *to*-construction and the *ing*-construction preferred the verbs listed in (8) and (9) respectively (listed in decreasing strength of association strength).

8. *try, wish, manage, seek, tend, intend, attempt, hope, fail, like, refuse, learn, plan* . . .
9. *keep, start, stop, avoid, end, enjoy, mind, remember, go, consider, envisage, finish* . . .

Again, many of the claims about the semantic differences between the two constructions are confirmed. For one, the verbs most distinctively associated with the infinitival construction, *try* and *wish*, both denote potentiality, while the verbs most distinctive for the gerundial construction, *keep, start, and stop*, denote actual events. Along similar lines, many of the collexemes distinctive for the infinitival construction are future-oriented (*intend, hope, learn, and aim* are just a few examples), while the distinctive collexemes of the gerundial construction evoke an interpretation in relation to the time of the utterance (*avoid, end, imagine, hate, etc.*).

As before, the question arises as to what extent learners are aware of these statistical tendencies, especially since these two patterns provide few other clues such as, for instance, the order of semantic roles they involve. Gries and Wulff therefore performed a similar sentence-completion experiment involving priming with German learners of English (mean number of years of English instruction: 11 years). (This study included several additional factors that are of no concern here.) In a logistic regression involving priming and verbs' attraction to both constructions, Gries and Wulff found that the collostructional preference of the verb in the target fragment was by far the strongest predictor of the learners'

sentence completions. Also, Wulff and Gries (in press) show that the same native-speaker collostructional preferences are also highly significantly correlated with learners' preferences obtained from the German part of the ICLE.

As with the ditransitives and prepositional datives, different kinds of evidence support the collostructional approach and its implications: native speakers and learners exhibit very similar preferential patterns of construction use.

Conclusion

This article has discussed several different case studies—involving different experiments and different corpus data—all of which yield converging evidence in support of a quantitative corpus-linguistic method to explore the syntax–lexis interface, the collostructional approach. This approach yields replicable quantitative data for the general description of constructions' distributional characteristics and/or verb subcategorization preferences as well as other processing-related accounts of acquisition, learning, and priming. However, another feature of this approach that is just as attractive is that it is compatible with much recent work in usage-based cognitive linguistics and psycholinguistics that adopts an exemplar-based perspective, in which learning is based on the memorization of, and probabilistic abstraction from, thousands of exemplars. Such collostructional studies are therefore more than just a convenient quantification of co-occurrence phenomena: they also provide a motivated way for relating empirical results and contemporary linguistic and psycholinguistic theorizing.

Corpus Linguistics: Overview

MICHAEL STUBBS AND DOROTHEA HALBE

Corpus linguistics means the use of computer-assisted methods to study large quantities of real language. Such research is important for applied linguists because they investigate questions about actual language use. Due to advances in technology, researchers can discover new facts and test hypotheses about aspects of language which were not previously accessible to empirical observation. These include the frequencies of linguistic patterns as language varies over time and in different social settings and also many aspects of routine language use which are not obvious even to native speakers.

The data used in corpus linguistics are a "language corpus," which since the 1990s (see CORPUS LINGUISTICS: HISTORICAL DEVELOPMENT) usually means a text collection which is large, computer-readable, and designed for linguistic analysis. A general reference corpus aims to provide a broad and balanced sample of a language. Such a corpus can consist of hundreds of millions of words of running text, sampled from thousands of individual texts, which are selected according to specific criteria such as a sociolinguistic theory of language variation. Smaller specialized corpora (see CORPORA: SPECIALIZED) can provide samples of specific text types (e.g., anything from the casual spoken language of teenagers to the formal written language of academic research articles). Software allows the texts to be rapidly searched, in order to find, list, sort, and count words, phrases, and grammatical patterns.

These new technological resources help researchers to describe as accurately as possible how language is used in everyday life. In the past, central aspects of human behavior were inaccessible to systematic study, since it was impossible to search for patterns in such huge quantities of data. Nowadays, the new data and methods have radically changed how dictionaries and grammars are produced. The first corpus-based dictionary was by Sinclair (1987) and major grammars based on data from large corpora include Sinclair (1990), Francis, Manning, and Hunston (1996, 1998), Biber, Johansson, Leech, Conrad, and Finegan (1999), and Carter and McCarthy (2006).

Applied linguists must then assess the practical relevance of this work. Can the linguistic descriptions and principles which have been developed by corpus linguists be applied directly to practical problems (e.g., teaching a language or improving translation practices), or must applied linguists develop their own descriptions and principles which are relevant to their specific problems? It used to be argued that applied linguistics needs linguistics: you have to have linguistics before you can apply it (Corder, 1973). Nowadays many applied linguists would argue exactly the opposite: it is the difficulties which arise in analyzing real-world data which lead to a reappraisal of the concepts used by linguistics. The latter framing certainly characterizes the relationship between knowledge production and knowledge use in corpus linguistics today.

In addition, linguistics cannot, on its own, solve real-world problems in which language is a major factor. There are always other nonlinguistic factors, such as psychological, social, and financial (e.g., in language teaching) factors. Applied linguists must therefore often interpret and integrate findings from other disciplines, such as psychology and sociology, and applied linguists have therefore investigated many different relations between language and the world.

2 CORPUS LINGUISTICS: OVERVIEW

Corpus methods can be directly applied to some practical problems: for example, preparing dictionaries for advanced learners (a central task in language teaching), or helping to make documents easier to understand for average readers (a task in campaigns to simplify bureaucratic language), or comparing quantitative features of texts in order to identify the author of anonymous letters (one task for forensic linguists). Other implications are less direct, but help us to understand the relation between language and its users better: for example, empirical studies of language use can give insight into how language is learned by children or stored in the brains of adults, and how language relates systematically to aspects of the social world, such as social class, gender, and age.

The productivity of corpus methods today is the result of the foundational work on corpora since the 1960s, carried out (in rough chronological order) by scholars such as Nelson FRANCIS, Henry KUČERA, Randolph QUIRK, Sidney GREENBAUM, Geoffrey LEECH, Jan SVARTVIK, Stig JOHANSSON, John SINCLAIR, and Douglas BIBER. Such work is comprehensively reviewed in introductions to corpus linguistics (e.g., Kennedy, 1998; Biber, Conrad, & Reppen, 1998; Stubbs, 2001; Meyer, 2002; Teubert, 2006; Lindquist, 2009).

At the center of corpus linguistics is frequency information, and several entries discuss the kinds of quantitative analyses (see CORPUS ANALYSIS OF KEY WORDS) which corpus software makes possible. Other entries provide detailed examples of the implications and applications of this information, especially for educational and professional purposes. Major areas covered are how corpus methods are used in the study of the following:

- Different languages: see CORPORA: CHINESE-LANGUAGE, CORPORA: ENGLISH-LANGUAGE, CORPORA: FRENCH-LANGUAGE, CORPORA: GERMAN-LANGUAGE, and CORPUS ANALYSIS OF SIGN LANGUAGES (although this is only a small sample of work which is becoming available in different languages).
- Varieties of English: English as a world language (see CORPUS ANALYSIS OF ENGLISH AS A WORLD LANGUAGE) and a lingua franca (see CORPUS ANALYSIS OF ENGLISH AS A LINGUA FRANCA), dialects of English (see CORPUS ANALYSIS IN DIALECTOLOGY), styles of English (spoken and written [see CORPUS ANALYSIS OF WRITTEN ENGLISH FOR ACADEMIC PURPOSES]), and relations between spoken language and gesture (using data from multimodal corpora [see CORPORA: MULTIMODAL]).
- Written text types: documents in institutions (e.g., the European Union [see CORPUS ANALYSIS OF EUROPEAN UNION DOCUMENTS], the Royal Society [see CORPUS ANALYSIS OF SCIENTIFIC AND MEDICAL WRITING ACROSS TIME]), historical documents (see CORPUS ANALYSIS OF HISTORICAL DOCUMENTS), political (see CORPUS ANALYSIS OF POLITICAL LANGUAGE) and literary (see CORPUS ANALYSIS OF LITERARY TEXTS) texts, translated texts (see CORPUS ANALYSIS IN TRANSLATION STUDIES), and the huge variety of texts on the World Wide Web (see CORPUS ANALYSIS OF THE WORLD WIDE WEB).
- Spoken and written language use in social situations such as workplaces (see CORPUS ANALYSIS OF LANGUAGE IN THE WORKPLACE) and school classrooms, where discourse for professional (see CORPUS ANALYSIS OF BUSINESS ENGLISH) and academic purposes (see CORPUS ANALYSIS OF SPOKEN ENGLISH FOR ACADEMIC PURPOSES) has implications for advanced language learning.
- Language use in social situations where accurate communication is essential: in public policy (see CORPUS ANALYSIS IN SOCIAL AND PUBLIC POLICY RESEARCH) and the courtroom (see CORPUS ANALYSIS IN FORENSIC LINGUISTICS), and in the design of systems for multinational/multilinguistic real-time communication at sea, in the air, and between police and emergency services (see CORPUS ANALYSIS FOR OPERATIONAL COMMUNICATION).
- Vocabulary and phraseology: where accurate description has applications in the preparation of better and more accurate monolingual and bilingual dictionaries.

- Work which has psychological and educational implications (see CORPUS STUDY: COGNITIVE IMPLICATIONS), including first language acquisition (child language [see CORPUS ANALYSIS OF CHILD LANGUAGE]), second language learning (e.g., analysis of learner language) and second language teaching (including syllabus design [see CORPUS ANALYSIS FOR A LEXICAL SYLLABUS], and the use of corpus software in the language classroom [see CORPORA IN THE LANGUAGE-TEACHING CLASSROOM]).

In a famous statement, Brumfit (1997) defines applied linguistics as “the theoretical and empirical investigation of real-world problems in which language is a central issue.” The entries show how the rapid development of hardware and software, especially since the 1990s, has contributed substantially to the accurate descriptions of real language use which are essential to this aim.

Corpus Study: Cognitive Implications

NICK C. ELLIS

Cognition

“Perception is of definite and probable things” (James, 1890, p. 82). From its very beginnings, psychological research has recognized three major experiential factors that affect cognition: frequency, recency, and context (e.g., Anderson, 2000). Learning, memory, and perception are all affected by frequency of usage: the more times we experience something, the stronger our memory for it, and the more fluently it is accessed. The more recently we have experienced something, the stronger our memory for it, and the more fluently it is accessed. (Hence your more fluent reading of the previous sentence than the one before.) The more times we experience conjunctions of features, the more they become associated in our minds and the more they subsequently affect perception and categorization; so a stimulus becomes associated with a context and we become more likely to perceive it in that context. The power law of learning describes the relationships between practice and performance in the acquisition of a wide range of cognitive skills—the greater the practice, the greater the performance, although effects of practice are strongest at early stages of learning, thereafter diminishing and eventually reaching asymptote (Newell, 1990). The power function relating probability of recall to recency is known as the *forgetting curve* (Ebbinghaus, 1885).

William James’s words which begin this entry concern the effects of frequency upon perception. There is a lot more to perception than meets the eye, or ear. A percept is a complex state of consciousness in which antecedent sensation is supplemented by consequent ideas which are closely combined with it by association. The cerebral conditions of the perception of things are thus the paths of association radiating from them. If a certain sensation is strongly associated with the attributes of a certain thing, that thing is almost sure to be perceived when we experience that sensation. But where the sensation is associated with more than one reality, unconscious processes weight the odds, and we perceive the most probable thing: “all brain-processes are such as give rise to what we may call FIGURED consciousness” (James, 1890, p. 82). Accurate and fluent perception thus rests on the perceiver having acquired the appropriately weighted range of associations for each element of the sensory input.

It is human categorization ability which provides the most persuasive testament to our incessant unconscious figuring or “tallying” (Ellis, 2002). We know that natural categories are fuzzy rather than monothetic. Wittgenstein’s (1953) consideration of the concept *game* showed that no set of features that we can list covers all the things that we call games, ranging as the exemplars variously do from soccer, through chess, bridge, and poker, to solitaire. Instead, what organizes these exemplars into the *game* category is a set of family resemblances among these members—son may be like mother, and mother like sister, but in a very different way. And we learn about these families, like our own, from experience. Exemplars are similar if they have many features in common and few distinctive attributes (features belonging to one but not the other); the more similar are two objects on these quantitative grounds, the faster are people at judging them to be similar. Prototypes, exemplars which are most typical of a category, are those which are similar to many

members of that category and not similar to members of other categories. Again, the operationalization of this criterion predicts the speed of human categorization performance—people more quickly classify as *birds* sparrows (or other average-sized, average-colored, average-beaked, average-featured specimens) than they do birds with less common features or feature combinations like those of kiwis or penguins (Rosch, Mervis, Gray, Johnson, & Boyes-Braem, 1976). Prototypes are judged faster and more accurately, even if they themselves have never been seen before: someone who has never seen a sparrow, yet who has experienced a range of other birds, will still be fast and accurate in judging it to be a bird (Posner & Keele, 1970). Such effects make it very clear that although people don't go around consciously counting features, they nevertheless have very accurate knowledge of the underlying frequency distributions and their central tendencies. Cognitive theories of categorization and generalization show how schematic constructions are abstracted over less schematic ones that are inferred inductively by the learner in acquisition. So psychology is committed to studying these implicit processes of cognition.

Language Cognition

The last 50 years of psycholinguistic research has demonstrated language processing to be exquisitely sensitive to usage frequency at all levels of language representation: phonology and phonotactics, reading, spelling, lexis, morphosyntax, formulaic language, language comprehension, grammaticality, sentence production, and syntax (Ellis, 2002). Language knowledge involves statistical knowledge, so humans learn more easily and process more fluently high frequency forms and “regular” patterns which are exemplified by many types and which have few competitors. Psycholinguistic perspectives thus hold that language learning is the implicit associative learning of representations that reflect the probabilities of occurrence of form–function mappings. Frequency is a key determinant of acquisition because “rules” of language, at all levels of analysis from phonology, through syntax, to discourse, are structural regularities which emerge from learners’ unconscious lifetime analysis of the distributional characteristics of the language input. In James’s terms, learners have to figure language out.

It is these ideas which underpin the last 30 years of investigations of language cognition using connectionist and statistical models (Christiansen & Chater, 2001), the investigation of how frequency and repetition bring about form in language and how probabilistic knowledge drives language comprehension and production (Bybee & Hopper, 2001; Bod, Hay, & Jannedy, 2003), and the proper empirical investigations of the structure of language by means of corpus analysis exemplified elsewhere in this encyclopedia. Corpus linguistics allows us to count the relevant frequencies in the input.

Frequency, learning, and language come together in usage-based approaches which hold that we learn constructions while engaging in communication, the “interpersonal communicative and cognitive processes that everywhere and always shape language” (Slobin, 1997). Goldberg’s (2006) construction grammar argues that all grammatical phenomena can be understood as learned pairings of form (from morphemes, words, idioms, to partially lexically filled and fully general phrasal patterns), and their associated semantic or discourse functions: “the network of constructions captures our grammatical knowledge *in toto*, i.e. it’s constructions all the way down” (Goldberg, 2006, p. 18). Such beliefs, increasingly influential in the study of child language acquisition, have turned upside down generative assumptions of innate language acquisition devices, the continuity hypothesis, and top-down, rule-governed processing, bringing back data-driven, emergent accounts of linguistic systematicities. Constructionist theories of child language acquisition use dense longitudinal corpora to chart the emergence of creative linguistic competence from children’s

analyses of the utterances in their usage history, and from their abstraction of regularities within them (Tomasello, 2003; Goldberg, 2006). Children typically begin with phrases whose verbs are only conservatively extended to other structures. A common developmental sequence is from formula, to low-scope slot-and-frame pattern, to creative construction.

Second Language Cognition

What of second language acquisition (L2A)? Language learners, both L1 and L2, share the goal of understanding language and how it works. Since they achieve this based on their experience of language usage, there are many commonalities between first and second language acquisition that can be understood from corpus analyses of input and cognitive- and psycholinguistic analyses of construction acquisition following associative and cognitive principles of learning and categorization. Thus usage-based approaches, cognitive linguistics, and corpus linguistics are increasingly influential in L2A research (Robinson & Ellis, 2008; Collins & Ellis, 2009; Ellis & Cadierno, 2009), albeit with the twist that since they have previously devoted considerable resources to the estimation of the characteristics of another language—the native tongue in which they have considerable fluency—L2 learners' computations and inductions are often affected by transfer, with L1-tuned expectations and selective attention (Ellis, 2008) blinding the acquisition system to aspects of the L2 sample, thus biasing their estimation from naturalistic usage and producing the limited attainment that is typical of adult L2A.

Construction Learning as Associative Learning From Usage

If constructions as form–function mappings are the units of language, then language acquisition involves inducing these associations from experience of language usage. Constructionist accounts of language acquisition thus involve the distributional analysis of the language stream and the parallel analysis of contingent perceptual activity, with abstract constructions being learned from the conspiracy of concrete exemplars of usage following statistical learning mechanisms. Psychological analyses of the learning of constructions as form–meaning pairs is informed by the literature on the associative learning of cue–outcome contingencies where the usual determinants include: factors relating to the form such as frequency and salience; factors relating to the interpretation such as significance in the comprehension of the overall utterance, prototypicality, generality, and redundancy; factors relating to the contingency of form and function; and factors relating to learner attention, such as automaticity, transfer, overshadowing, and blocking (Ellis, 2008). Corpus linguistic and psycholinguistic research together show how these various factors conspire in the acquisition and use of any linguistic construction.

Input Frequency

- *Construction frequency.* That language users are sensitive to the input frequencies of constructions (Ellis, 2002) entails that they must have registered their occurrence in processing. These frequency effects are thus compelling evidence for usage-based models of language acquisition which emphasize the role of input.
- *Type and token frequency.* Token frequency counts how often a particular form appears in the input. Type frequency, on the other hand, refers to the number of distinct lexical items that can be substituted in a given slot in a construction, whether it is a word-level construction for inflection or a syntactic construction specifying the relation among words. For example, the “regular” English past tense *-ed* has a very high type frequency

because it applies to thousands of different types of verbs, whereas the vowel change exemplified in *swam* and *rang* has a much lower type frequency. The productivity of phonological, morphological, and syntactic patterns is a function of type rather than token frequency (Bybee & Hopper, 2001). This is because (a) the more lexical items that are heard in a certain position in a construction, the less likely it is that the construction is associated with a particular lexical item and the more likely it is that a general category is formed from the items that occur in that position; (b) the more items the category must cover, the more general are its criterial features and the more likely it is to extend to new items; and (c) high type frequency ensures that a construction is used frequently, thus strengthening its representational schema and making it more accessible for further use with new items. In contrast, high token frequency promotes the entrenchment or conservation of irregular forms and idioms; the irregular forms only survive because they are of high frequency.

- *Zipfian distribution.* In the early stages of learning categories from exemplars, acquisition is optimized by the introduction of an initial, low-variance sample centered on prototypical exemplars. This low variance sample allows learners to get a fix on what will account for most of the category members. The bounds of the category are defined later by experience of the full breadth of exemplar types. Goldberg, Casenhiser, and Sethuraman (2004) demonstrated that in samples of child language acquisition, for a variety of verb-argument constructions (VACs), there is a strong tendency for one single verb to occur with very high frequency in comparison to other verbs used, a profile which closely mirrors that of the mothers' speech to these children. In natural language, Zipf's law (Zipf, 1935) describes how the highest-frequency words account for the most linguistic tokens. Goldberg, Casenhiser, and Sethuraman (2004) showed that Zipf's law applies within VACs too, and they argue that this promotes acquisition: tokens of one particular verb account for the lion's share of instances of each particular argument frame; this pathbreaking verb is also the one with the prototypical meaning from which the construction is derived.

Ellis and Ferreira-Junior (2009a, 2009b) investigated effects on naturalistic L2A of type/token distributions in the islands comprising the linguistic form of English verb-argument constructions (VL verb locative like *go there*, VOL verb object locative like *put it in the fridge*, VOO ditransitive like *give him the money*) in the ESF corpus (Perdue, 1993). They showed that VAC verb type/token distribution in the input is Zipfian and that learners first acquire the most frequent, prototypical, and generic exemplar (e.g., *put* in VOL, *give* in VOO, etc.). Their work further illustrates how acquisition is affected by the frequency and frequency distribution of exemplars within each island of the construction (e.g., [Subj V Obj Obl_{path/loc}]) and by their prototypicality.

- *Recency.* Language processing also reflects recency effects. This phenomenon is known as *priming* and may be observed in phonology, conceptual representations, lexical choice, and syntax. Syntactic priming refers to the phenomenon of using a particular syntactic structure given prior exposure to the same structure. This behavior has been observed when speakers hear, speak, read, or write sentences (Pickering & Ferreira, 2008). There is now a growing body of research demonstrating such L2 syntactic priming effects (McDonough & Trofimovich, 2008).

Form: Salience and Perception

The general perceived strength of stimuli is commonly referred to as their salience. Low salience cues tend to be less readily learned. Many grammatical meaning-form relationships, particularly those that are notoriously difficult for second language learners, like

grammatical particles and inflections such as the third person singular -s of English, are of low salience in the language stream. For example, some forms are more salient: *today* is a stronger psychophysical form in the input than is the morpheme -s marking third person singular present tense, thus while both provide cues to present time, *today* is much more likely to be perceived, and -s can thus become overshadowed and blocked, making it difficult for second language learners of English to acquire (Ellis, 2008).

Function

- *Prototypicality of meaning.* Categories have graded structure, with some members being better exemplars than others. The prototype as an idealized central description is the best example of the category, appropriately summarizing the most representative attributes of a category. As the typical instance of a category, it serves as the benchmark against which surrounding, less representative instances are classified. The greater the token frequency of an exemplar, the more it contributes to defining the category, and the greater the likelihood it will be considered the prototype. Ellis and Ferreira-Junior (2009a) show that the verbs that second language learners first used in particular VACs are prototypical and generic in function (*go* for VL, *put* for VOL, and *give* for VOO). The same has been shown for child language acquisition, where a small group of semantically general verbs, often referred to as light verbs (e.g., *go, do, make, come*) are learned early.
- *Redundancy.* Redundant cues tend not to be acquired (Rescorla & Wagner, 1972). Not only are many grammatical meaning–form relationships low in salience, but they may also be redundant in the understanding of the meaning of an utterance. For example, it is often unnecessary to interpret inflections marking grammatical meanings such as tense because they are usually accompanied by adverbs that indicate the temporal reference. Second language learners' reliance on adverbial over inflectional cues to tense has been extensively documented in longitudinal studies of naturalistic acquisition (Dietrich, Klein, & Noyau, 1995).

Contingency of Form–Function Mapping

Psychological research into associative learning has long recognized that while frequency of form is important, so too is contingency of mapping. Consider how, in the learning of the category of birds, while eyes and wings are equally frequently experienced features in the exemplars, it is wings which are distinctive in differentiating birds from other animals. Wings are important features for learning the category of birds because they are reliably associated with class membership, unlike eyes. Raw frequency of occurrence is less important than the contingency between cue and interpretation. Contingency, and its associated aspects of predictive value, information gain, and statistical association, is a driving force for all associative learning (Shanks, 1995). It is central in psycholinguistic theories of language acquisition too (Ellis, 2006), with the most developed account for second language acquisition being that of the competition model (MacWhinney, 2009). Ellis and Ferreira-Junior (2009b) show how psychological measures of form–function contingency, as well as collostructional analysis measures (Gries, 2008), predict VAC acquisition. Boyd and Goldberg (2009) argue that conditional probability is a more appropriate measure. This is still an active area of inquiry, and more research is required before we know which statistical measures of form–function contingency relate more strongly to acquisition and processing.

Language Learning as Estimation From Sample

Language learners have limited experience of the target language. Their limited exposure poses them the task of estimating how linguistic constructions work from an input sample that is incomplete, uncertain, and noisy. Native-like fluency, idiomaticity, and selection present another level of difficulty. For a good fit, every utterance has to be chosen, from a wide range of possible expressions, to be appropriate for that idea, for that speaker, for that place, and for that time. And again, learners can only estimate this from their finite experience.

As with other estimation problems, successful determination of the population characteristics is a matter of statistical sampling, description, and inference. There are three fundamental instructional aspects of this conception of language learning relating to statistical sampling and estimation, and corpus linguistics is central to each.

1. The first and foremost concerns *sample size*. As in all surveys, the bigger the sample, the more accurate the estimates, but also the greater the costs. Native speakers estimate their language over a lifespan of usage. L2 and foreign language learners just don't have that much time or resources. Thus, they are faced with the task of optimizing their understanding of language from a limited sample of exposure.

Corpus linguistic analyses are essential to the determination of which constructions of differing degrees of schematicity are worthy of instruction, their relative frequency, and their best (= prototypical and most frequent) examples for instruction and assessment. Gries (2008) describes how three basic methods of corpus linguistics (frequency lists, concordances, and collocations) inform the instruction of second language constructions.

2. The second concerns *sample selection*. Principles of survey design dictate that a sample must properly represent the strata of the population of greatest concern. Corpus linguistics, genre analysis, and needs analysis have a large role to play in identifying the linguistic constructions that are of most relevance to particular learners. For example, every genre of English for academic purposes and English for special purposes has its own phraseology, and learning to be effective in the genre involves learning this (Swales, 1990). Lexicographers develop their learner dictionaries based on relevant corpora and dictionaries focus on examples of usage as much as on definitions, or even more so. Good grammars are now frequency-informed. Corpus linguistic analysis techniques have been used to identify the words most relevant to academic English (the Academic Word List, Coxhead, 2000) and this, together with knowledge of lexical acquisition and cognition, informs vocabulary instruction programs (Nation, 2001). Similarly, corpus techniques have been used to identify formulaic phrases that are of special relevance to academic discourse, and to inform learners' instruction (the Academic Formulas List: Ellis, Simpson-Vlach, & Maynard, 2008).
3. The third concerns *sequence of exposure*. Corpus linguistics also has a role to play in informing the ordering of exemplars for optimal acquisition of a schematic construction. The research reviewed above suggests that an initial, low-variance sample centered on prototypical exemplars allows learners to get a "fix" on the central tendency of a schematic construction, and then the introduction of more diverse exemplars helps learners to determine the full range and bounds of the category. Although there is work to be done on determining its applicability to particular constructions, and particular learners and their L1s, in second language acquisition, this is probably a generally useful instructional heuristic. Readings in Robinson and Ellis (2008) show how an understanding of the item-based nature of construction learning inspires the creation and evaluation of instructional tasks, materials, and syllabi, and how cognitive linguistic

analyses can be used both to inform learners how constructions are conventionalized ways of matching certain expressions to specific situations, and also to guide instructors in isolating and presenting the various conditions that motivate speaker choice.

Future Research Directions in Corpus Linguistics and Cognition

Usage is rich in latent linguistic structure, thus frequencies of usage count in the emergence of linguistic constructions. Nevertheless, as Einstein observed, “Everything that can be counted does not necessarily count; everything that counts cannot necessarily be counted.” Corpus linguistics provides the proper empirical means whereby everything in language texts can be counted. But not everything that we can count in language counts in language cognition and acquisition. If it did, the English articles *the* and *a* alongside frequent morphological inflections would be among the first learned English constructions, rather than the most problematic in L2A.

The study of applied linguistics from corpus linguistic perspectives is a two-limbed stool without triangulation from an understanding of the psychology of cognition, learning, attention, and development. Sensation is not perception, and the psychophysical relations mapping physical onto psychological scales are complex. The world of conscious experience is not the world itself but a perception crucially determined by attentional limitations, prior knowledge, and context. Not every experience is equally important: effects of practice are greatest in early stages but eventually reach asymptote. The associative learning of constructions as form–meaning pairs is affected by: factors relating to the form such as frequency and salience; factors relating to the interpretation such as significance in the comprehension of the overall utterance, prototypicality, generality, and redundancy; factors relating to the contingency of form and function; and factors relating to learner attention, such as automaticity, transfer, and blocking.

We need models of usage and its effects on acquisition. Univariate counts are vague indicators of how the demands of human interaction affect the content and ongoing coadaptation of discourse, how this is perceived and interpreted, how usage episodes are assimilated into the learner’s system, and how the linguistic system reacts accordingly. We need models of learning, development, and emergence that take all these factors into account dynamically.

Corpus-Based Linguistic Approaches to Critical Discourse Analysis

WINNIE CHENG

Why Are Corpus Linguistics and Critical Discourse Analysis Combined?

In language and communication research, a wide range of theoretical frameworks and methodological approaches have been employed, among which are corpus linguistics (CL), critical discourse analysis (CDA), and an innovative combination of CL and CDA (Baker et al., 2008).

CL is an empirical method of linguistic analysis and description, which uses corpora as the primary data and starting point. It accommodates the full evidence from the corpus and analyzes this with the aim of finding “probabilities, trends, patterns, co-occurrences of elements, features or groupings of features” (Teubert & Krishnamurthy, 2007, p. 6) and arrives at generalizations about language phenomena. Basic CL research methods include the generation and study of word lists, key words, collocates, and concordances, backed up with measures of statistical significance. CL is primarily quantitative and interested in the local context of situation, namely the analysis of concordance, which is “a collection of the occurrences of a word-form, each in its own textual environment” (Sinclair, 1991, p. 32). Corpus linguistic methods have been applied to address discourse-level phenomena, namely “characteristics associated with the use of a language feature,” “realizations of a particular function,” “characterizing a variety of language,” and “mapping the occurrences of a feature through entire texts” (Conrad, 2002, p. 75). CL has also been employed in CDA research.

CDA views “language as discourse and as social practice” (Fairclough, 2001, p. 21) and studies the relationship between language and ideology (e.g., van Dijk, 1997; Fairclough, 2001; Wodak, 2001). Following Halliday’s (1985) approach that perceives “language as firmly rooted in its sociolinguistic context” (Orpin, 2005, p. 37), CDA is comprised of three stages: description of text, interpretation of the relationship between text and interaction, and explanation of the relationship between interaction and social context (Fairclough, 2001, pp. 21–2).

CDA has been criticized for its methodological weakness, mainly due to its qualitative approach to linguistic analysis, which results in “fragmentary [and] exemplificatory” text types (Fowler, 1996, p. 8). Others, including Widdowson (1996, 2000a), criticize CDA for lacking in academic rigor, primarily because data analysis tends to bear out the analyst’s subjective preconceptions (Orpin, 2005, p. 38). Stubbs’s (1997) criticisms of CDA are mainly concerned with its lack of representativeness in the short or fragmentary texts and randomly selected data, as well as the failure on its part to make generalizations of the results of CDA research because the linguistic features are rarely compared with norms in the language (Orpin, 2005, p. 38).

In response to this criticism, Stubbs (1997) suggests using CL methodology to bolster CDA, specifically through using random sampling, analyzing a large collection of text, and comparing the textual features under study with language norms captured in a corpus in

order to make reliable generalizations about typical language use. Responding to Widdowson's (2000b) position paper, "On the Limitations of Linguistics Applied," Stubbs (2001) points out that although Widdowson raises important issues about text interpretation, his argument is flawed: "since he does not discuss the inherently quantitative, variable, and comparative nature of corpus data, he cannot directly discuss the relations between textual, cognitive, and social phenomena" (p. 149).

The challenge of marrying the qualitative methods of CDA, which examine grammatical or lexical choices made to express social processes and social phenomena, and the quantitative CL methodology, which is mainly used for studying the lexicogrammatical and collocational patterns of lexical items (Sinclair, 1996), is to decide "which aspects of the CDA approach can be best served by corpus analysis" and "to find a point or points of entry into the data" (Orpin, 2005, pp. 38–9).

Research Studies Using CL Approaches to CDA

Some studies have usefully and effectively combined CDA and CL methods by comparing frequencies of words and phrases and collocational and syntactic patterning (Orpin, 2005), including investigation into pronoun use in sexism and language (Stubbs, 1992); transitivity choices in the encoding of causation and agency in geography textbooks (Stubbs & Gerbig, 1993); analysis of representations of the EU in the British press (Hardt-Mautner, 1995), representations of women in the news (Caldas-Coulthard, 1993); the diachronic study of *ethnic*, *racial*, and *tribal* between two corpora, namely the pre-1985, 18-million-word Birmingham Collection of English Texts and the post-1985 Bank of English, at that time 167 million words (Krishnamurthy, 1996); comparison of representations of the foreign in the British and Polish press (Galasinski & Marley, 1998; see below); business texts about ecological issues (Alexander, 1999); British parliamentary debates on European integration (Bayley, 1999); analysis of New Labour rhetoric (Fairclough, 2000); and the reporting of the 1995 Yorkshire drought (Jeffries, 2003).

Using a transcribed political interview from a corpus of 65 interviews recorded from the BBC between 1985 and 1990, Simon-Vandenberg (1997) investigates "modal (un)certainly in political discourse" (p. 341). The term "modal certainty" refers to devices speakers use "to convey a high degree of commitment to the validity of their propositions" (p. 344) as "means of 'intrusion into the speech event' [to] express interpersonal meanings" (Simon-Vandenberg, 1997, p. 344). The study analyzes the most important interpersonal choices identified in the political interview, namely modal auxiliaries and adverbs (*will*, *going to*, and *would*); modality expressed by lexical verbs (*I think*, *I suppose*); modality expressed by conditional clauses; modality expressed by nouns (*possibility*, *chance*, *likelihood*, etc.); usuality (*continuously*, *constantly*, *ever ever*, *never*); evaluative adjectives that express grading (*incredible*, *remarkable*, *great*), including superlatives and degree words (*completely*, *relatively*, *somewhat*, etc.); quantifiers (*all*, *any(thing/body)*, *none*, *most*, *the majority*, *many*, *a load of*, *very few*); scaling by syntactic means, that is, repetition and parallel structures; metalinguistic comments with a modal value; marked choices of person; the lexical register of deception and imagination; and lastly the modal function of intonation (Simon-Vandenberg, 1997, pp. 345–50).

Beaugrande (2001) converts Widdowson's (2000b) position paper into a miniature data corpus and conducts a corpus-based CDA by subjecting the paper to analysis by the three methods criticized in it, namely Halliday's functional linguistics, Sinclair's CL, and Fairclough's CDA. The corpus is analyzed in terms of frequent words, such as *reality* and its other forms, *argue* attested in verbs and nouns, and the concordances of these words, to uncover "some interpretative possibilities that might otherwise not be realized" (p. 118).

In Hong Kong, Flowerdew (2004) examines a corpus of 140 speeches, interviews, press conferences, and other pronouncements either delivered by or involving the first chief executive of the Hong Kong Special Administrative Region (SAR) of the People's Republic of China (PRC), Tung Chee-hwa, after the return of Hong Kong from Britain to Chinese sovereignty on July 1, 1997. Flowerdew's findings show that Tung's discourse has an emphasis on the development of a "knowledge-based" economy in relation to the free market (2004, p. 1553), and when Tung speaks about the economy in a positive manner, very often he is referring to the state of the Chinese, rather than Hong Kong's, economy (p. 1567). Tung's discourses show an attempt to downplay the role of democratic development and to emphasize both that Hong Kong people are believers in Confucian values and Hong Kong people's essential Chineseness, trying to "establish a new identity for the people of Hong Kong" (pp. 1575–6).

Also in Hong Kong, Cheng (2004) reports on the analysis of 12 public speeches made by Tung Chee-hwa between October and December 2001, at two levels of meaning making: collocational and intonational. The study provides evidence for the ways in which a public speaker constructs a relationship with the audience and the ways in which the speaker conveys particular meanings and ideological positions by means of making lexicogrammatical and intonational choices, both directly and indirectly. Cheng (2004) concludes that, first, some of the findings are less generalizable to other contexts where public speeches are made by political leaders because those examined in this study are specific to Hong Kong; second, political discourses and perhaps other genres in the public domain tend to transmit short-term priorities or agendas, albeit reflecting underlying values, as opposed to longer-term values and beliefs; third, politicians need to generate "buzz collocations" and "buzz idioms" to drive home their messages, but these also need to be reworked and repackaged from time to time, which may add to the temporary nature of some patterns of language use in the context of political speeches; and lastly, unique patterns of discourse intonation choices are found based on the key words and collocates examined.

Sotillo and Wang-Gempp (2004, p. 91) focus on quantitative and qualitative analyses of a 46,300-word corpus of online political discussions with residents of five northern New Jersey towns as participants. Their study analyzes the use of "epithets, hyperbole, lexical choices, word collocations, verbs of collocation, and personal pronouns" in the corpus, and by using a CDA framework, it examines the discursive practices in terms of social classes, power relations, and conflicting political ideologies.

In another study, Orpin (2005) examines a group of eight words that are semantically related to *corruption*, namely *corruption*, *sleaze*, *bribery*, *graft*, *malpractice(s)*, *impropriety/ties*, *nepotism*, and *cronyism*, in a corpus of 800 texts from 4 of the 17 subcorpora of British newspapers: the *Guardian*, the *Independent*, *The Times*, and the tabloid *Today*. By analyzing the semantic profiles, identifying the geographical locations the words refer to, and comparing the connotational similarities and differences of these words. Orpin (2005) finds that words with a noticeably negative connotation tend to be used when referring to activities in countries including Italy, Pakistan, South Korea, India, and Malaysia (pp. 56–7), while less negative words are used when referring to similar activities in the international pages of the British press (p. 57). The instances of language use are compared against the norms of language use as reflected in the then 323-million-word Bank of English (p. 59). Orpin (2005) draws on CDA theory to interpret the ideological stance shown, including in Britain the growing dissatisfaction with the then Conservative government, the public concern over deregulation and greater private ownership of previously public assets, and shifting awareness of corruption from abroad to Britain (pp. 57–8). Orpin concludes by declaring that corpus methodology is employed not to replace qualitative analysis but to complement it in order to back up CDA assertions with reliable, empirical evidence (p. 59).

O'Halloran (2007) studies one aspect of CDA, namely how metaphors in texts are used to express ideology, along the lines of Lee's (1992) analysis of metaphors in a hard news text. Examining a corpus of newspapers of 260 million words from six newspaper sub-corpora from 1999–2003, the Bank of English, O'Halloran examines the collocational and lexicogrammatical patterns of words that Lee identifies as metaphors, namely *simmering*, *erupted*, and *swept through*. Whereas Lee (1992) argues that *simmering* and *erupted* are used metaphorically for volcanoes, O'Halloran's (2007) hard news corpus study finds that "across different forms of the lemma, 'erupt', there would seem to be a *cline of delexicalisation* from 'eruption(s)' to 'erupt(s)' to 'erupted'" (p. 20), in that the past tense form *erupted*, as well as *has been simmering*, has a semantic association with human phenomena rather than volcanoes, while the collocational pattern of *eruption* reveals meanings "associated with volcanoes inside and outside the hard news register" (p. 20). This study therefore concludes that the corpus-informed interpretation of metaphor at the register level—hard news texts in this case study—has the advantage of avoiding both "pretextual metaphorical lexicalization of textual data" and "producing a misleading overall interpretation of textual data identified as metaphorical from the perspective of readers who have been routinely exposed to the text's register" (O'Halloran, 2007, p. 20).

Koteyko, Nerlich, Crawford, and Wright (2008) use corpus linguistics techniques and (critical) discourse analysis to examine "the assumptions, judgements, and contentions that structure two discourses of MRSA [methicillin-resistant *Staphylococcus aureus*]" (p. 223). They employ the analytic tools of frame analysis (Entman, 1993) and story line (Hajer, 1995). Entman's (1993, p. 52) linguistic framing works "to select some aspects of a perceived reality and make them more salient in a communicating text, in such a way as to promote a particular problem definition, causal interpretation, moral evaluation, and/or treatment recommendation for the item described," and Hajer's (1995) story lines function to position actors and to attribute blame, responsibility, urgency, and responsible behavior (Koteyko et al., 2008, p. 226). The CL tools of word lists and collocation are also employed as analytical tools to move frame analysis and story lines beyond subjective judgment (Van Gorp, 2007). The study begins with manual qualitative analysis of "media coverage, scientific literature and policy documents dealing with the spread of MRSA in UK hospitals" (p. 227), as a result of which two frames of "simple/not simple or not rocket science/no silver bullet" (p. 227) and several key words that are indicative of these frames, the adjectives *simple*, *basic*, and *proper* (p. 228), are identified. The qualitative approach is followed by "quantitative pattern recognition" (p. 227) by comparing the concordances of the three adjectives in a corpus of 801 British national newspaper articles (1995–2006) and a corpus of key UK government policies on MRSA and infection control in hospital settings (1998–2006) (p. 229). The empirical evidence collected from specialized corpora and computational tools validates qualitative "hunches" (p. 239) that coverage of MRSA is based on a "simple/not simple discursive dichotomy, which is evoked in different discourses . . . to blame others and to defend oneself against blame" (p. 239), and that the dominant frame of "simple cleanliness" is used to advocate solutions to MRSA problems, while that of "complexity" is used to challenge government policy or give defensive reasons as to why policies dealing with the problem of MRSA fail (p. 239).

Another recent example of combining CL and CDA is Baker et al. (2008), which adopts a corpus-assisted CDA methodology to examine the discursive presentation of refugees, asylum seekers, immigrants, and migrants (RASIM) in the British press over a 10-year period (1996–2005). Baker et al.'s project starts by investigating aspects of the wider context surrounding the issue of RASIM in the UK in order to inform the selection of texts and form a 140-million-word corpus. Focusing on the notions of keyness and collocation, the project examines the corpus to find out the relative frequencies and emerging statistically significant lexical patterns primarily involving the four key terms: *refugee(s)*, *asylum*

seeker(s), *immigrants(s)*, and *migrant(s)*, followed by the analysis of their concordances. Then selected parts of the textual corpus are qualitatively analyzed by drawing from relevant migration-related information in order to contextualize the findings of the text-based analysis.

Other studies are corpus-informed, using a corpus as a resource for data. For instance, Galasinski and Marley (1998) conduct a comparative quantitative content analysis of two corpora from the British and Polish press (10 national daily newspapers and 10 national weeklies from Britain and Poland) to identify agency in foreign news; the results are then used “as a frame for a qualitative critical linguistic analysis” (p. 565). While quantitative content analysis reveals “some of the media coverage of the moment” (p. 565), CDA complements this by revealing “long-standing patterns of discursive representations with their systemic biases and preferences” (p. 565). For example, in both presses, “coverage of the foreign is dominated by reporting in terms of either business and politics, with the former favoured in Britain and the latter in Poland” (p. 585). In addition, quantitative content analysis shows ambivalence in the British media’s attitude toward Russia, which usefully informs a qualitative content analysis of “negativity” (p. 586).

Musolff (1997, p. 230) suggests that the discourses of terrorism are “metaphorical-cocktails of political jargon,” and the discourses are expressed in terms of four dichotomies established through the metaphors of terrorism being good vs. evil, law vs. lawlessness, civilization vs. barbarism, and freedom vs. tyranny, all of which create illusory and metaphorical representations of terrorism being the possession of weapons of mass destruction (WMDs).

Future Directions for Corpus Linguistics and Critical Discourse Analysis

Increasingly, more studies have integrated CL and CDA to address social concerns, processes, and phenomena, by taking advantage of the complementary methods and approaches unique to these disciplines. Many of the corpora used in CDA studies so far are specialized ones, primarily media and political discourses. Future studies could explore other text types, such as feedback commentaries in education (Hyatt, 2005), academic classroom discourse (Csomay, 2006), and business media discourse (Koller, 2005), and integrate CL, CDA, and other fields such as intercultural rhetoric (Connor, 2004) and cognitive metaphor (Koller, 2005).

CL can also be combined with different theoretical approaches to CDA, including French discourse analysis (Pêcheux, 1982), critical linguistics (Kress & Hodge, 1979), social semiotics (Hodge & Kress, 1988), sociocultural change and change in discourse (Fairclough, 2001), sociocognitive studies (van Dijk, 1980), and the discourse-historical method (Wodak, 2001).

Corpus-Based Testing

FIONA BARKER

The Nature of Corpus-Based Testing

Principled collections of language texts—corpora—allow the storage, retrieval, and analysis of many tens of thousands of complete or partial texts, originally written, then spoken and now increasingly in multimedia formats. This entry outlines how these language databases and associated analytical techniques inform the field of language testing and assessment (LTA) which, like the discipline of corpus linguistics, has grown in scope, importance, and influence throughout the 20th century, particularly since the 1950s (see Spolsky, 1995 for a history of LTA).

LTA covers a wide range of approaches to testing aspects of language knowledge or use through discrete, standalone assessments or linked series of papers or components (see ALTE, 1998, for definitions of LTA terms). Other assessment instruments are less formal, involving in-class assessment (including virtual classrooms) or the collection of portfolios of language learners' work. The products of these tests or assessments may be rated (assigned a score or grade) or commented upon by the learners themselves, by peers, or instructors, and may also be externally assessed or moderated. There are many types and purposes of testing instruments which vary according to market demand, technological developments, and theoretical approaches in LTA and related applied linguistics fields (see Weir & Milanovic, 2003, for one examination board's approach).

The language testing field has become increasingly professionalized, accountable, and influential throughout the 20th century with the development of international associations of language testers such as ILTA (founded 1992; see www.iltaonline.com) and various standards of good practice such as AERA/APA/NCME (1999). Here we are concerned with how corpora inform the large-scale, high-stakes testing of language proficiency as this is where they have been applied most extensively to date.

Corpora and related techniques can be used throughout the cycle of planning, developing, delivering, and rating a language test (see Saville, 2003, pp. 78–87). Whilst corpora provide unique insights and unrivaled data of different types to language testers, they are not universally applied within LTA, some of the reasons for which are presented below along with examples of the successful use of English language corpora within this field.

Key Developments and Challenges

There has been a steady growth in corpus-informed LTA since Alderson (1996) encouraged language testers to bear in mind fundamental theoretical considerations such as *construct definition* and *validity* (see ALTE, 1998) alongside the results of corpus-informed empirical study. However, the development of collections of learner (and native user) production by examination boards predated this expression of how existing corpora could be used in specific parts of the language testing cycle. For example, the first scripts in the Cambridge Learner Corpus (CLC)—one of the largest learner corpora of exam scripts in existence—date from 1993 (see www.cambridge.org/elt/corpus). The development of any corpus

requires significant investments of time, capital, and expertise, and corpus-informed language tests require sufficient data in order to be applicable to an international candidature—which suggests why the use of corpora has taken time to establish itself within LTA. Much relevant research is long-term and interdisciplinary as examination providers need to be sure of the validity, reliability, impact, and generalizability of their corpus-based findings, these being examples of Bachman's (1990) "essential measurement qualities." Nevertheless, there has been a steady increase in language testers' willingness to engage with corpora in relation to designing, validating and rating language tests, as shown by symposia at international testing conferences (including Taylor, Thompson, McCarthy, & Barker, 2003) and publications that describe the differential use of learner and native corpora in developing new test materials or validating existing ones (Taylor & Barker, 2008) or report specific applications such as the automated assessment of written production (Shermis, Burstein, & Leacock, 2006). Examination boards have undertaken extensive corpus-building and corpus-informed research since the 1990s to support their tests, including TOEFL (see Biber, 2006) and IELTS (see Taylor & Falvey, 2007).

The main ways in which corpora are used in LTA are in (a) defining user needs and test purpose, (b) designing tests, and (c) refining task rating; some key studies relating to these areas are noted here. Corpora can reveal what language learners *can do*, which informs both what is tested at a particular proficiency level and how this is rated (see ALTE Members, 2002). Hawkey and Barker (2004) used learner corpus data in the development of a common scale for assessing writing across a range of proficiency levels and types of English whilst the testing division of the University of Michigan used a corpus of written and spoken language test production to revise the scoring criteria for the Examination for the Certificate of Competency in English (see www.lsa.umich.edu/eli). Studying learning materials in general or specific language domains—including the rapidly expanding professional areas such as aviation, financial, or legal language—also provides a corpus-informed approach to designing tests in terms of the range, level, and genre of questions required and at the more detailed level of individual items to be targeted. Learner production can also help language testers to describe more accurately various linguistic domains such as business English (Horner & Strutt, 2004) or legal English (Vidaković & Barker, 2010).

When we consider test design, corpora can show how learner output is a product of interrelating variables—elements of Weir's (2005) *socio-cognitive framework*—including the learners' demographic details, their learning environment, and the test mode (paper- or computer-based). Both learner and native corpora and learning materials (course books, syllabuses, classroom recordings, etc.) form the empirical basis of the English Profile Program which is an international, interdisciplinary research program whose primary aim is to develop reference level descriptions (RLDs) for English, that is, a systematic specification of learning objectives that describes what a learner can be expected to know at each proficiency level (see www.EnglishProfile.org). The overall goal of this Council of Europe endorsed program is to set professional standards for the learning, teaching, and assessment of English worldwide. This program started with the 30 million-word CLC and further written and spoken corpora are being developed to complement this resource; international teams are submitting learners' written responses and spoken data together with detailed demographic information plus assessments of proficiency levels across various educational contexts (see Alexopoulou, 2008). Researchers from various applied linguistics fields (computational linguistics, second language acquisition, psycholinguistics) are identifying criterial features for specific proficiency levels taking into account L1 influence (see www.EnglishProfile.org for current research).

More generally, learner corpora are used by test writers to explore the collocational patterning in learner or native production, so that common or less frequent patterns can

be tested to distinguish between candidates at a particular proficiency level. Additionally, the most frequent errors or misuses of specific collocational pairings can be used to provide suitable *distractor* items for multiple-choice questions. Corpus evidence—whether from learner or native corpora—is used alongside experienced question writers’ intuitions about what learners can be expected to know at a certain level, so is not considered to replace human question writers in the test writing process.

Various research projects—often undertaken by examination boards—have explored corpus-informed task rating since the 1990s in a bid to automatically score or evaluate written production, known as automated essay scoring (see Shermis et al., 2006, pp. 403–4), and the more challenging spoken production, both of which relate to the automatic detection of errors in learners’ output. One outcome of this area of research is the increasing number of online evaluation services where learners or their instructors can upload writing samples—sometimes in response to actual test questions—and receive back general or formative feedback (see, for example, ETS www.ets.org or Cambridge ESOL www.CambridgeESOL.org examination boards’ Web sites). There are also educational diagnostic services such as CALPER GOLD, which enables instructors to analyze emergent structures in their students’ work, which can inform teaching and assessment practices (McCarthy, 2008, p. 571). Another system designed for researchers, Coh-Metrix, identifies over 400 indices of cohesion, language, and readability which provides information on textual features, world knowledge, language, and discourse characteristics which has been used to investigate differences across closely related registers, including English/American legal texts (Hall, McCarthy, Lewis, Lee, & McNamara, 2007, pp. 41–3).

The rating or assessment provided by any automated system should be carefully considered, as it is clear that a computer cannot—and should not—“think” exactly like a human rater. Any assessment system’s utility and relevance depends on its design, the linguistic or other measures used to quantify “performance,” and the quantity and quality of the original corpus data upon which it was trained, just as any corpus needs to be checked for suitability before being used for research. Nevertheless, the future is bright for (semi-) automated means of assessing learner output, which should serve the learners and end-users of their test results well as long as they are fully informed about what these systems can and cannot provide.

The rapid increase in the number and type of tests delivered electronically means that it is now possible to form corpora from computer-based as well as paper-based language tests, although we should consider the potentially conflicting demands of maintaining the quality of existing language tests and of developing new ones to keep pace with user needs and technological innovations alongside the development and exploitation of corpus resources and techniques.

It is clear that the last two decades in particular have seen an increase in the number and visibility of corpora within the field of LTA. An important point to note is that corpora are being developed and used specifically for language testing and that these uses are being argued for and critiqued within the field rather than being adopted by all language testers. We should also note that tests of other languages make use of their own national corpora and that there is a growing (non-English) literature about corpora of other languages (see David Lee’s *Bookmarks for Corpus-based Linguists*, www.tiny.cc/corpora).

The final section considers the future of corpus-based testing for the assessment of language proficiency.

The Future of Corpus-Based Testing

The collection and use of large native and learner corpora from across the proficiency spectrum and specialized language domains are beginning to move from data collections

4 CORPUS-BASED TESTING

driven by consortia of publishers, examination boards, and academic researchers (e.g., British National Corpus, see www.natcorp.ox.ac.uk) towards data collections where individual teachers or learners upload their own data which can be exploited by all contributors, even though these are still likely to be guided by a specific research program (e.g., English Profile Corpora, see Web site).

Besides the large-scale projects mentioned above there is a growing body of corpus research that informs more localized tests or particular test tasks, or is more general and exploratory in nature. For example, researchers have used corpora to validate oral production and interaction in various L2 English contexts: discourse variation in intermediate-level paired speaking tests of various L1 learners (Young & Milanovic, 1992), fluency markers of adolescent Norwegian learners of English (Hasselgreen, 2005), and interaction in a group discussion task of Chinese learners (He & Dai, 2006). Other research projects are exploring aspects of written and spoken data using a comparative approach, in a similar way to the English Profile Program. For example, the WOSLAC Project (Mendikoetxea, 2006) uses English and Spanish L1/L2 corpora to inform the learning, teaching, and assessment of both languages. The LONGDALE Project (Longitudinal Database of Learner English) uses learners' written and spoken production, demographic details and proficiency level to inform SLA and teaching practices (see <http://www.uclouvain.be/en-cecl-longdale.html>). These more specific uses are likely to increase as the benefits of corpus-informed research become more widely known.

Corpora are becoming increasingly more visible and accessible through online access and downloadable resources including courses, analytical systems, and search tools as well as the datasets themselves. At the heart of LTA lies the process of identifying the construct to be tested; how this is to be tested stems from having a clear concept of what is to be tested. Language corpora are helping to reveal previously intuited facts about language structure, functions, and use in first and other language users, with evidence from the output of learner, novice, and expert users in a range of domains such as general purpose, professional, or academic contexts. Without corpora language testers would be unable to validate some of their long-held intuitions about language which underpin current testing practices.

The field of corpus linguistics and the existence of corpora have begun to bring significant benefits to language testing. New types of corpora are pushing the boundaries of what data it is possible to collect, such as multimodal linguistic corpora (see the HeadTalk gesture corpus, Knight et al., 2006), and the increasing number of multinational and interdisciplinary approaches to corpus data collection, annotation, and exploitation make the future of corpus linguistics an exciting one for LTA. The latest developments can be followed through electronic discussion lists or blogs (see, for example, Corpora List at www.hit.uib.no/corpora and Text Tools for corpus linguistics at <http://corpustools.blogspot.com>).

The development and use of corpora continue to gather momentum and there are many freely available datasets for noncommercial use, although more needs to be done to make further datasets available at realistic cost. The collection of adequate permissions for use of an individual's work in a corpus is often a barrier to making data more widely available, as are commercial concerns where organizations may not wish for their data (collected over many years and at great expense) to become available to competitors. Despite this, the future of corpus-based testing is bright, as long as all involved remain clear about the roles and responsibilities of the providers and users of the data within the relevant corpora; the impact on tests informed by corpora, and the wider social impact of the tests themselves.

Correlational Research in Language Assessment

THOM HUDSON

Researchers in language assessment are frequently interested in determining the relations between two or more variables. One of the most fundamental statistics for indicating the strength of relations between two variables is the correlation coefficient, r . The correlation coefficient is also one of the foundations for many other analytic procedures in applied linguistics and the behavioral sciences. It estimates the linear association between two variables, and provides a numerical value between -1.0 and $+1.0$ to represent that relationship. A correlation of near zero implies no relationship whereas values near $+1.0$ or -1.0 imply strong positive and negative relationships, respectively.

Language studies have utilized correlation to investigate a number of questions. Bonk (2001) addressed the research question, "Is there a correlation between proficiency in producing and recognizing collocations and general English proficiency?" (p. 119). He found a correlation of $r = .61$ between tests measuring the two variables. Pulido (2009) was interested in how L2 learners of Spanish process lexical input during reading. The research question was "What is the relationship between lexical inferencing and retention?" (p. 38). She found that with a production measure, correlations were positive and significant, $r = .45$ for more familiar topics and $r = .60$ for less familiar topics. Liu and Jackson (2008) were interested in the relationship between Chinese EFL learners' communicative reticence and anxiety. These researchers found the correlation coefficient between a measure of unwillingness to communicate and foreign language anxiety to be $r = .535$. In all three of these cases, the researchers were interested in how two variables systematically varied together.

Graphical Display of Correlational Relationships

Figures 1–3 graphically display the scatterplots which represent the types of relationships that the correlation coefficient is designed to reveal. Suppose you had three sets of data. Each data set contains the numerical results for 35 students on two variables. For each student in each data set, you can find the student's score along the horizontal axis and the corresponding score along the vertical axis. In Figure 1, there is very little indication of a systematic linear relationship between the two variables. It is not the case that as the scores on X increase, the scores on Y systematically increase or decrease. There almost appears to be a random relationship between the two variables.

In Figure 2, on the other hand, we begin to see a bit of systematicity. As scores on X increase, the scores on Y also tend to increase. There is obviously not a one-to-one relationship in the change, but a tendency in the directionality of the changes in the two scores can be discerned.

Finally, in Figure 3, we see a one-to-one relationship. For each unit of change in X , there is a unit of change in Y . The result is a plot that is represented by data points along a straight line. Researchers examine these types of graphical displays to determine that the relationship between the two variables is best summarized by a correlation coefficient, which assumes a linear relationship.

Direction and Magnitude of Correlation Coefficients

The two characteristics of the correlation coefficient that are generally of most interest are the direction and magnitude of the correlation. A correlation coefficient can be either positive or negative in direction. With a positive correlation, the scores on one variable increase as the scores on the second variable increase. This is the relationship shown in Figure 3. With a negative correlation, as the scores on one variable increase, the scores on the second variable decrease. If a relationship between two variables is negative, the graphical display will depict this relationship as shown in Figure 4.

As noted above, the correlation coefficient can range from -1.0 to $+1.0$. The larger the magnitude of the absolute value of the correlation coefficient, the stronger the relationship between the two correlated variables. The squared value of the correlation coefficient, r^2 , the coefficient of determination, represents the percentage of shared variation in one variable that overlaps the variation in a second variable. It is a measure of the strength of association between the variables and helps to interpret the meaningfulness of the correlation coefficient. Knowing the percentage of overlapping variance across the two variables is much more informative than simply knowing the correlation coefficient alone.

Correlation Coefficients

There are a number of variants of the correlation coefficient, depending upon the nature of the measurement scale. In applied linguistics the scales are generally interval, ordinal, or nominal. Interval scales have continuous equal units throughout the scale and have an arbitrary zero point. Ordinal scales are those which reflect relationships that are ranked in nature, such as *first*, *second*, *third*. The relative order is indicated, but the actual difference

Figure 4 Graphic representation of negative correlation

between the adjacent categories is not specified. Nominal scales present a classification system that situates items, persons, or other objects into mutually exclusive categories. Classifications such as *male/female*, *L1/L2*, or *advanced/beginning* represent nominal scale assignments. These different scales require separate approaches to address the correlational relations in the data.

The most commonly presented correlation index is the Pearson product-moment correlation coefficient. It is used to describe the linear relationship between two interval scale variables with normal distributions. The Pearson product-moment correlation indicates the extent to which a person's rank on one variable is the same on a second variable.

Although the Pearson correlation is the most common type of correlation reported, other correlation coefficients have been devised to account for situations in which the two variables are not on interval scales. The three most common coefficients are the Spearman rank order correlation, the point biserial correlation, and the phi coefficient.

The Spearman rank order correlation (ρ or r_s), for example, is used when the underlying data are ordinal in nature. Data may be represented as ordinal if they were initially collected to represent the relative rankings of individuals on the two variables, or if the underlying data are problematic (perhaps with a number of outliers, small numbers, or non-normal distributions) such that the ordinal relations lend themselves to analysis more readily than the original interval data.

When the relationship of interest is between one dichotomous variable (e.g., coded 1 or 0) and another that is on an interval scale, the point biserial correlation (r_{pbi}) is used. Common examples include male or female, or correct and incorrect answers on a multiple-choice test item, with some variable such as test score measured on an interval scale. Point biserial

correlations are used regularly during test development to compute item discrimination values for test items.

When X and Y are both coded as dichotomous variables the phi (ϕ) coefficient is used. In language assessments, for example, it might be of interest to examine the extent to which class level membership is related to one of two first languages.

Correlational Use in Reliability

Correlation has specific uses within language assessment research and practice. Correlational concepts are at the heart of measurement reliability. The reliability of measurements can be estimated with procedures which fall into four categories: internal consistency, test-retest, alternate forms, and inter-rater reliability. Each approach is designed to estimate the consistency of measurements. Internal consistency reflects the extent to which items or parts of a test produce similar results. A correlation between the test parts is used to estimate reliability. Test-retest reliability provides an estimate of the test stability across time by administering a test at two different times to the same group of examinees and finding the correlation coefficient between scores on the two administrations. Alternate forms reliability involves administering two different but parallel forms of a test to the same group of examinees. The correlation between the two forms of the test is the estimate of reliability. Inter-rater reliability is used when raters are involved in the process of assigning numerical scores to examinees' production. This is frequently the case in the assessment of writing or speaking, or in other performance assessments. The correlation between raters is the estimate for the reliability of the ratings. Each of the approaches to estimating reliability is concerned with the correlational consistency of data results.

Correlation Approaches in Measurement Validation

Correlation is also a central feature of validation research. One part of the validation process can involve an examination of whether an assessment rank orders examinees in the same way as other measures of the posited construct. Thus, if a test developer is interested in developing a new approach to testing the academic English ability of second language learners, it might be useful to correlate the new assessment instrument to other tests of academic English, such as TOEFL or IELTS. While this alone is certainly not sufficient to establish test validity for this use, it can serve as one piece in the argumentation process.

The goal above is to show congruence between a measure of a particular construct and other measures of the same construct. By extension, an argument can be made that it should also be possible to show that the new measure performs differently from measures of different constructs. That is, it should be possible to demonstrate divergence from other constructs. Likewise, it is important to demonstrate that the test method itself (e.g., multiple choice, performance, task based, etc.) is not a primary factor in the performance outcomes. These concerns are the basis for multitrait-multimethod (MTMM) analysis (Campbell & Fiske, 1959). MTMM examines the correlations between measures of multiple traits using multiple methods.

Factor analysis is a statistical approach which analyzes the interrelationships among variables in order to explain the common underlying dimensions, or factors, of these variables. The statistical approach condenses the information contained in a number of original variables into a smaller set of dimensions. The basic data structure used as input for factor analysis is the correlation matrix.

Regression is an outgrowth of correlation analysis. In its most basic form, simple linear regression allows the prediction of one variable on the basis of another variable. For

example, an English as a second language program might know the correlation between the TOEFL examination and the placement examination that is given to incoming international students. The predicted value on the placement test can be found by multiplying the correlation between the placement test and the TOEFL by an incoming student's known TOEFL score.

Path analysis is a correlational procedure that allows the prediction of multiple dependent variables. Path analysis uses a series of multiple regression analyses to ascertain the relationships among a set of variables. It is used to indicate the relative effects of variables such as motivation, anxiety, years of study, GPA, and memory span on such outcomes as vocabulary learning and fluency. The model that is developed is generally depicted as a path diagram with arrows indicating the direction and strength of the relationships.

An additional correlational approach used for validation research is structural equation modeling (SEM). SEM is an integration of factor analysis, multiple regression, and path analysis. As Raykov and Marcoulides (2006) note, "SEM provides researchers a comprehensive method of the quantification and testing of substantive theories" (p. 1). Some characteristics of structural equation models are that models are conceived and often constructed in terms of variables that are not directly measurable, like anxiety, aggression, or personality; models generally take potential errors of measurement into account by including an error term for each measure; and models are usually constructed to address interrelationships between all pairs of observed variables. SEM is used in confirmatory factor analysis to test whether data agree with a priori hypothesized numbers of factors and relationships among the variables. As such, it can be used in assisting with construct validation of test results.

Conclusion

Correlation is one of the most commonly used statistical approaches in language assessment. It demonstrates the strength of association between two variables. It indicates the extent to which subjects are rank ordered in the same way on two variables relative to all other subjects in a collection of data. Within language assessment, it is used in the test construction process and in the test validation endeavor.

Cotterill, Janet

RIA PERKINS

Dr Janet Cotterill is a British linguist, born 1968, with specializations in a range of linguistics including forensic linguistics, systemic functional linguistics, discourse analysis, and language and gender.

She holds a BSc (Hons) from Aston University, a Master's degree from Liverpool, and received her PhD from Birmingham University. Cotterill is now a Reader in Language and Communication in the School of English, Communication, and Philosophy at Cardiff University. She has been involved with the International Association of Forensic Linguistics (IAFL) for many years, holding the positions of President (2007–9), Vice President, and Secretary as well as presently being a member of the Executive Committee. She cofounded the International Language and Law Association (ILLA) and is now coeditor of the association's online journal. Cotterill also sits on the editorial boards of a range of journals, including the *International Journal of the Semiotics of Law* and the *International Journal of Speech, Language and the Law*, as well as holding the position of UK Commissioning Editor for the Oxford University Press monograph series in Language and Law. She has also been accepted for training to become a magistrate.

Cotterill's profession and academic background was originally in the fields of translation and interpreting, then teaching English as a foreign language (TEFL) and applied linguistics. This has led her to be based in various different countries besides the United Kingdom, including France, Egypt, and Japan. Cotterill has accrued considerable experience as a consultant and expert witness within the field of forensic linguistics; she was involved in the case of Dhiren Barot who pleaded guilty in 2006 to terrorist offences including a planned attack on London. She now runs her own forensic linguistics consultancy specializing predominantly in the areas of terrorism risk assessment, murder, suicide, threat and blackmail documentation, and authorship analysis (particularly within the context of SMS text messages and e-mail messages, and textual cases).

To date she has published over 40 articles and book chapters covering a range of topics within linguistics and forensic linguistics. She has also published eight books as author, editor, or coeditor. The initial focus of Cotterill's work within forensic linguistics focused on the area of language within the legal process, the potential interactional problems between the legal expert and the layperson, and the potential role of the linguist within this setting. These interests are reflected in her 2002 acclaimed edited collection *Language in the Legal Process*. Among other themes, this demonstrates Cotterill's interest in the area of the language of the police, which can also be seen in her earlier publication (2000), "Reading the Rights: A Cautionary Tale of Comprehension and Comprehensibility."

Cotterill utilizes a range of approaches throughout her works, but in her early publications, and particularly the 2003 monograph which was based on her PhD dissertation (Cotterill, 2003), she centered predominantly on corpus and discourse analysis approaches. *Language and Power in Court: A Linguistic Analysis of the O. J. Simpson Trial* examines the trial of O. J. Simpson, who was accused of murdering his wife and killing the man she was with, to explore seldom-questioned features and strategies of trial language. This work demonstrates some key themes in her early research, in particular the interplay of narratives within the courtroom, and the realization of power within legal settings. Another

key theme was the use of metaphor within the trial. Cotterill focused on this in her 1998 article, demonstrating through an analysis of the O. J. Simpson criminal trial that metaphor is prevalent within trial language, and that it both aids jury comprehension and is a valuable coercive device.

Besides the discourse of the legal process, Cotterill has also focused her research on the language surrounding sexual abuse and rape. In 2007 Janet Cotterill published the edited collection entitled *The Language of Sexual Crime*, which looks at the discourse that surrounds sexual abuse and rape across a wide variety of settings and from a variety of perspectives and approaches. It not only explores sexual crimes in a variety of different places—the USA, Scotland, Hong Kong, Ireland, and Israel—it also looks at a variety of contrasting discourses, from the wording of the law to the questioning of child witnesses. This collection elucidates much about the discourse surrounding rape, as well as challenging many of the preconceptions and assumed truths.

Recently Cotterill's research has progressed into the area of semiotics; this can be seen in her recent article, "Mugshots and Motherhood: The Media Semiotics of Vilification in Child Abduction Cases" (Cotterill, 2010). In this article she analyzes the media portrayal of mothers whose children have been abducted. As can be seen in her early work relating to the O. J. Simpson trial, Cotterill predominantly takes a case study approach, focusing in particular on Karen Mathews, the mother of Shannon Mathews who was missing for 24 days in 2008 (Karen was later charged for her involvement in engineering the apparent kidnap of Shannon). Cotterill contrasted the portrayal of working-class Karen Mathews with that of the middle-class Kate McCann, mother of Madeleine McCann who went missing in 2007 (and sadly remains missing). Cotterill demonstrates the ways the media make judgments about both women and question their roles as mothers; she also analyzes the wider field and addresses the social semiotics surrounding the media portrayal of female criminals. Through this she demonstrates that a woman who commits a crime that breaks the social expectations of how women should behave will attract a greater level and volume of media attention than a man would, particularly if the crime contravenes the expectations of nurturing and the perceived instinct toward motherhood. She points out that they will not only receive more media attention, but that the portrayal within the media will be more critical and more negative.

Janet has two forthcoming monographs in preparation: one on the discourse of multiple sclerosis and another on the language of the courtroom.

Coulthard, Malcolm

SAMUEL TOMBLIN

Professor Richard Malcolm Coulthard (b. 1943) is an English linguist and prominent figure in applied linguistics who is recognized for his research on discourse analysis. Additionally, through his research, teaching, and consultancy, he has shaped the field of forensic linguistics into a credible subdiscipline of applied linguistics both in the UK and internationally. Coulthard founded the International Association of Forensic Linguists in 1993 and served until 1995 as the founding president. He cofounded the association's journal, *The International Journal of Speech, Language and the Law* (formerly *Forensic Linguistics*) which first saw publication in 1994 and which he continued to edit until 2007.

As an undergraduate, Coulthard studied English Language and Literature at Sheffield University before joining the London Institute of Education to pursue a career teaching English. While studying for the Postgraduate Certificate in Education, Coulthard became interested in how factors such as socioeconomic class and language ability affect educational achievement, and particularly the work of Basil Bernstein. This interest led him to University College London where he enrolled on a two-year Postgraduate Diploma in Linguistics under Michael Halliday, whose influence led Coulthard to adopt a functional approach to linguistic analysis. Coulthard commenced his doctoral research with John Sinclair at the University of Birmingham. His research evaluated Bernstein's theory of restricted and elaborated codes through empirical investigation.

After completing his doctoral thesis in 1970, Coulthard accepted a lectureship at the University of Birmingham and remained in post for 37 years, during which time he developed undergraduate, postgraduate, and research programs and was key in the growth of the department from initially just himself and Sinclair to 28 members of staff at the time he left. To mark his fiftieth birthday and in recognition of his contribution to the department of Modern English Language, Coulthard was presented with a *festschrift* edited by his colleagues John Sinclair, Michael Hoey, and Gwyneth Fox (1993). Drawing on his own isolated experience as a doctoral researcher, Coulthard formed an informal group of PhD students to discuss forensic linguistics research. Many of his PhD students have themselves developed successful careers in forensic linguistics, most notably Sue Blackwell, Janet Cotterill, Tim Grant, Krzysztof Kredens, and Frances Rock. In 2004, Coulthard moved to Aston University, becoming the world's first Professor of Forensic Linguistics and in 2008 he founded the Centre for Forensic Linguistics. Coulthard is Emeritus Professor of English Language and Linguistics at the University of Birmingham, Honorary Professor at Cardiff University, and previously held a professorial position at the Federal University of Santa Catarina, Brazil (1987–9).

Coulthard has authored and edited 22 books and over 60 book chapters and articles. He achieved international fame for his 1977 textbook, *An Introduction to Discourse Analysis*, in which he drew together research from various disciplines including philosophy, psychology, sociology, anthropology, and linguistics in an attempt to create a unified discipline focusing exclusively on the study of interaction, namely, discourse analysis. In 1985 a second edition of the book was published to reflect current research, and the general editor commented that Coulthard had "put discourse analysis on the map" (Coulthard, 1985, p. vii). In 1992 Coulthard edited a collection of papers in the area of spoken discourse analysis

which was followed by an edited collection of papers focusing on the analysis of written text (1994a). Both collections represented work from the Birmingham perspective which located text analysis in a systemic view of language, taking into account the purpose and process of text creation and which recognized the interactive nature of written text (Coulthard, 1994a, p. xi).

Coulthard, in collaboration with Alison Johnson, wrote *An Introduction to Forensic Linguistics: Language in Evidence* (2007), a textbook aimed at students. Split into two parts, the first explored the language of the legal process while the second dealt specifically with language as evidence. Coulthard and Johnson argued that sound knowledge of descriptive linguistics is essential for forensic linguistics research and to that end provided comprehensive references to other areas of linguistic research. Coulthard and Johnson emphasized the importance of authentic data and used engaging and illustrative examples, often drawn from their own casework. The textbook was followed by a comprehensive, more advanced introduction to the field of forensic linguistics, *The Routledge Handbook of Forensic Linguistics* (Coulthard & Johnson, 2010) which marked the transition from what was once an emerging field to a developed and established subdiscipline of applied linguistics. Drawing on a variety of established and early-career researchers working in different countries from a range of disciplines, the handbook is a fitting celebration of forensic linguistics.

Coulthard is a respected expert witness. He accepted his first case in the mid-1980s and has since been commissioned to prepare over 200 reports for both prosecution and defense in civil and criminal cases. Coulthard's expertise shaped his earlier consultancy work in forensic discourse analysis typically to establish the authenticity of disputed police interviews and witness statements and confessions. One such case involved William Power, one of six Irishmen collectively known as the Birmingham Six, who were arrested after bombs planted by the IRA exploded in two public houses. All were convicted partly as a result of disputed confessions. Focusing particularly on coherence, overspecificity, terms of address, and repetition, Coulthard was able to demonstrate that the confession contained features of police register indicating police interference. This evidence called into question the credibility of the police officers, and after 17 years in prison, all six men were released (see Coulthard, 1994b).

One of Coulthard's highest profile cases involved Derek Bentley who in 1953, aged 19, was hanged for shooting a police officer despite the fact that Bentley's friend, Chris Craig, had fired the shot and that Bentley was in police custody at the time of the shooting (Coulthard, 1994b, pp. 31–2). Bentley was illiterate and had a low IQ. During his trial, he claimed that the police had helped him to write his statement, which they denied on oath, claiming instead that "the statement was an accurate 'verbatim' record of what Bentley had actually said" (p. 32). Through a comparison of Bentley's statement with a sample of witness statements and statements from police officers, Coulthard was able to show that one feature in particular, the temporal marker "then," was used atypically in Bentley's statement. Coulthard found it occurred more frequently in police statements and Bentley's statements than in comparable authentic witness statements. Coulthard also investigated structural positioning and found that in police statements, as with the Bentley statement, there was a high frequency in the postposed position (*then I* rather than *I then*). Coulthard consulted a reference corpus and found that in ordinary spoken texts, "then" occurred more often in the preposed position. He concluded that Bentley's statement contained a marked feature of police register and therefore could not have been a verbatim record of what Bentley had said. In 1998, Coulthard's evidence was accepted and as a result of all the evidence in the trial, Bentley's murder conviction was quashed by the Court of Appeal.

Coulthard also has an extensive case history in the field of authorship analysis. His most recent high profile case centered around the authorship of mobile telephone text messages. In 2008, Coulthard provided evidence in court during the trial of David Hodgson for the

murder of Jenny Nicholl who had gone missing in 2005. Several days after her disappearance, friends and relatives received text messages sent from Nicholl's mobile telephone indicating that she was alive and well. Suspicion grew over the authenticity of the text messages, and proving their authorship became a key issue. Hodgson, who had been having an affair with Nicholl, was arrested for her murder. Coulthard compared the disputed text messages with genuine messages known to have been authored by Nicholl and Hodgson. Focusing on stylistic features including spacing, spelling, abbreviations, dialectal stylizations, and letter-number substitutions, Coulthard was able to demonstrate that the disputed text messages were closer in style to those of Hodgson. The jury found Hodgson guilty and he was sentenced to 18 years in prison for the murder of Nicholl, whose body has never been found.

Coulthard (1994b) observed that in the early days of investigative forensic linguistics, there was no clear methodology "and the work was usually undertaken as an intellectual challenge and almost always required the creation, rather than simply the application, of a method of analysis" (p. 27). Through illustrative examples and discussion of his casework, Coulthard (1994b) made the case for the application of corpus linguistics as a methodology, arguing that large general corpora and more specialized corpora are required to enable detailed analyses of particular genres and registers: "only when we know very much more about the 'normal' and the authentic can we be fully secure in identifying the deviant, the unauthentic and the falsified" (p. 40). Coulthard is particularly respected for publishing details of his casework and he has drawn on his experience as an expert witness to highlight potential problems in presenting linguistic evidence in UK courts (e.g., Coulthard, 1997, 2004) and how experts may most effectively express their opinions (Coulthard, 2010).

WALDEMAR MARTYNIUK AND JOSEPH SHEILS

Introduction

The Council of Europe, currently (December 2010) encompassing 47 European states, was founded in 1949 as a platform for intergovernmental cooperation aiming at promoting democracy, human rights, and the rule of law. Language education plays an important role in pursuing these goals, and programs of intergovernmental cooperation in the field of languages have been carried out by the Council for over 50 years now.

Early programs of international cooperation in Strasbourg focused on the democratization of language learning for the mobility of persons and ideas, and on the promotion of the European heritage of cultural and linguistic diversity. Projects assisted member states in implementing reforms aimed at developing learners' communication skills and encouraged innovation in language teaching and teacher training, with an emphasis on a learner-centered approach. These ideas have found practical expression through the development of reference instruments known as *threshold levels* from 1972 onwards (for details see Trim, 2007).

While continuing to promote innovation in support of developing communication skills in foreign languages, more recent projects have increasingly addressed the social and political dimensions of language learning, focusing on language education for social cohesion, democratic citizenship, and intercultural dialogue. Currently, the Council of Europe offers a concept of plurilingual and intercultural education within which skills in all languages available to the learners are being taken into account and developed further in a lifelong learning process, to ensure successful development of the individual and for the benefit of the society they live in and contribute to. Council of Europe policy attaches particular importance to the development of plurilingualism—the lifelong enhancement of the individual's linguistic repertoire. This repertoire is made up of different languages and language varieties at different levels of proficiency and includes different types of competences. It is dynamic and changes in its composition throughout an individual's life (for details see Beacco & Byram, 2007; Council of Europe, 2010). As the Council of Europe attaches particular importance to the recognition and valuing of the cultural and linguistic diversity of people, plurilingualism is considered a value, not just a competence.

Policy Documents and Tools in Support of Plurilingual People Living in Multilingual Societies

Council of Europe language education policies have initially been based on Article 2 of the *European Cultural Convention* (1954), which encourages all states parties to take steps for the mutual promotion, teaching and learning of languages. The *European Charter for Regional or Minority Languages* (1992) offers specific measures to promote the use of this category of languages in education (particularly Part III, Article 8). In 1995, the member states of the Council of Europe, through the *Framework Convention for the Protection of*

2 COUNCIL OF EUROPE LANGUAGE POLICY AND PLANNING

National Minorities, agreed to “undertake to promote the conditions necessary for persons belonging to national minorities to maintain and develop their culture, and to preserve the essential elements of their identity, namely their religion, language, traditions and cultural heritage” (Section II, Article 5).

The important role the Council of Europe attaches to language education has led to the adoption of a number of policy recommendations. These include

- *Recommendation No. R (98) 6 of the Committee of Ministers on Modern Languages*, emphasizing intercultural communication and plurilingualism as key policy goals and proposing concrete measures for each educational sector and for initial and in-service teacher education;
- *Recommendation 1383 (1998) of the Parliamentary Assembly of the Council of Europe on Linguistic Diversification*, stating among other things that “there should be more variety in modern language teaching in the Council of Europe member states; this should result in the acquisition not only of English but also of other European and world languages by all European citizens, in parallel with the mastery of their own national and, where appropriate, regional language”;
- *Recommendation Rec (2005) 3 of the Committee of Ministers on teaching neighboring languages in border regions*, urging the governments of member states “to apply the principles of plurilingual education, in particular by establishing conditions that enable teaching institutions in border regions at all levels to safeguard or, if need be, introduce the teaching and use of the languages of their neighbouring countries, together with the teaching of these countries’ cultures”;
- *Recommendation R (2008) 7 of the Committee of Ministers on the use of the CEFR [Common European Framework of Reference for Languages] and the promotion of plurilingualism*, outlining general principles and measures to be implemented by authorities responsible for language education at national, regional, and local level as well as specific measures aimed at policy making, curriculum and textbook development, teacher training, and assessment.

The Language Policy Division of the Council of Europe (LPD) has developed a range of instruments for the implementation of these recommendations. The *Guide for the Development of Language Education Policies in Europe* (Beacco & Byram, 2007) is a reference document for the formulation or reorganization of language teaching policies to promote plurilingualism and diversification in a planned manner. The *Common European Framework of Reference for Languages* (Council of Europe, 2001) provides a common basis and a common language for the elaboration of syllabuses, curriculum guidelines, textbooks, and teacher-training programs, and for relating examinations to one another. Many countries including those outside Europe have used the publication of the CEFR to stimulate curriculum and examination reforms in different educational sectors. Possible avenues for working with the CEFR and the *European Language Portfolio* (ELP) in the Canadian context have been recently outlined in a publication of the Canadian Council of Ministers of Education (2010). The ELP is a document in which those who are learning or have learned any language—whether at school or outside school—can record and reflect on their language learning and cultural experiences. The *Autobiography of Intercultural Encounters* invites users to reflect critically upon their own memorable intercultural experiences, and helps them to analyze these in retrospect and in light of the most defining aspects of each encounter. The most recent *Guide for the Development and Implementation of Curricula for Plurilingual and Intercultural Education* (Council of Europe, 2010) focuses on the right to a quality education. Its aim is to make teaching more effective, and increase the contribution it makes, both to school success for the most vulnerable learners, and to social cohesion.

The ideas and proposals put forward in the Guide form part of the project “*Languages in Education—Languages for Education*,” contributions to which are published on a *Platform of Resources and References for Plurilingual and Intercultural Education*. The LPD is also offering tools and guidelines regarding the linguistic integration of migrant children in education systems and the linguistic integration of adult migrants.

The European Centre for Modern Languages

The *European Centre for Modern Languages* (ECML), a Council of Europe Partial Agreement based in Graz, Austria, offers support for the implementation of Council of Europe policies at classroom level. The Centre’s consecutive programs of activities have by now comprised more than 50 projects coordinated by international teams of experts and has directly involved over six thousand language professionals in Europe and beyond, with the impact reaching as far afield as Canada, Japan, and countries in Africa. The ECML is offering innovative tools in support of teacher education and the implementation of plurilingual approaches to education, such as the *European Portfolio for Student Teachers of Languages* (Newby, Allan, Fenner, Jones, Komorowska, & Soghikyan, 2007) and the *Framework of Reference for Pluralistic Approaches to Languages and Cultures* (Candelier, 2011).

Critical Analysis of Discourse in Educational Settings

GLENN TOH

Ideologies and Inequitable Practices

Critical analyses of discourses in education are fundamentally affected by the fact that much of education, whether as an academic field or enterprise, is born of ideologies that result in inequitable practices, power differentials among people of different race, culture, gender, class, and socioeconomic differentiation. The need for discourse and discursive practices to be critically analyzed in education settings stems, moreover, from the understanding that education can never be free of values and ideology.

Values and ideologies are embodied, staged, and claimed in and through discursive action and keenly contested in discursive spaces. Such spaces and the contestations thereof are, therefore and in turn, inherently discursive in nature. Politicized action and ideologized practices in education are often enacted in the academy, making it an important site for critical analyses of power-laden discourses and power-born cultural practices. Such discourses and cultural practices create, sustain, perpetuate, and reproduce power inequalities, precipitating and increasing the marginalization of disadvantaged groups. The irony is that education is an enterprise that might be thought of as being emancipatory and empowering, or at worst neutral, in its outcomes. Pennycook (2000, p. 93) captures this succinctly in the following description:

An optimistic liberal view of education is that it provides opportunity for all: anyone can go to school, receive equal treatment, and come out at the end as whatever they want. Yet it does not take a very sophisticated critical analysis to suggest that this is far from what actually happens.

Exposing Ideologies and Inequitable Practices

Critical analyses of prevailing power- and ideology-laden discourses and practices aim to surface and expose tools, techniques, strategies, and rhetoric behind existing ideologies that mask social injustice while manufacturing compliance. Such analyses reexamine and reformulate existing understandings of the nature and formulations of what counts as legitimate (or legitimized) knowledge and seek to bring about more just and ethical educational practices. Put simply, they expose inconsistencies, contradictions, hypocrisies, foibles, and fallacies that come to bear on educational practices in the hope of achieving greater fairness.

Critical analyses of discourse in education proceed from the important assumption that knowledge, including knowledge of even a “scientific” nature, is a sociodiscursive construct. They examine how knowledge, and the access to privilege and power through knowledge, can be a dividing force in society, resulting in clear power differentiations between those who have access to legitimized forms of it and those who do not. A significant part of the

work seeks to highlight, problematize, and contest assumptions about the origins and nature of what counts as knowledge, but which invariably belie sociohistories as well as ideological underpinnings that legitimize and reify these assumptions. Hence, critical analysis of discourse in educational settings becomes an area of study that destabilizes existing bastions of unfair and polarizing practices relating to the construction and appropriation of knowledge. Such practices perpetuate injustices often glossed over as convention or “tradition.” They keep the privileged in positions of dominance and the disadvantaged in subordinate roles.

In terms of intellectual roots, critical analyses of discourse in educational settings find inspiration from studies in critical discourse analysis (an area of study that acknowledges the role of language in the way that power relations, as well as bias and prejudice, are structured in society—see van Dijk, 1984, 2001 and Wodak, 2001) alongside studies in critical pedagogy, critical social literacy, critical sociolinguistics, and critical applied linguistics, which trace their roots to critical literacy and in turn critical theory. A commonly adopted premise in studies that relate to education is that elitist cultural practices and the identities, subjectivities, mythologies, rhetoric, and narratives thereof are in fact dissimulated or at least not immediately visible (Turner, 2004), and need to be explored through deeper analysis. While power positions in the academy are legitimated and reified, projects of domination are systemically obscured and occluded. Hence, there is the need to have these exposed.

Areas of Critical Analysis

Conventional discourse analyses in educational settings have involved several established areas of study. They include analyses of discourse strategies, communicative acts, classroom interaction as cultural practice, classroom discourse, and literacy development, as well as discourse studies of second language development (Pennycook, 2000). In contrast, critical analyses of discourse in educational settings adopt a palpably more politicized view of education and have taken the form of the studies described in the following section.

Critical Analyses of Textbook Content and Ideology

Textbooks have been critically examined for their content and ideology. In particular, textbook analyses have targeted matters to do with race, culture, gender, beliefs, and class and how these are treated in reading passages and exercises. The types of characters featured in reading passages and the way they are described and represented feature commonly in textbook analyses. Other research has looked into the way themes and topical issues are treated in the study content (Apple & Christian-Smith, 1991; Dendrinos, 1992; Baik, 1994). The findings of such analyses often reveal that certain types of people are portrayed advantageously; for example, White Caucasian characters may come across as being decent and happy people living comfortable lives employed in white-collar jobs, while people of color are portrayed as shady individuals living in disadvantaged circumstances and employed in blue-collar jobs. Western lifestyles are typified as being English-speaking and middle-class, characterized by vacations and seaside picnics, as opposed to the rural, spartan and deprived lifestyles of non-Westerners. Such analyses can help to reveal the subtle messages and values that are transmitted to students.

Curriculum Content and Approaches to Curriculum Design

Curriculum content and approaches to curriculum design have also been the subject of critical analyses. These studies focus on how curriculum planning can be politicized and

ideologically motivated, resulting in curricular goals and content that can be politically or culturally biased toward certain dominant or hegemonic ideologies. Such analyses can also expose how curricula can be mobilized to fulfill certain agendas. For example, ESP curricular content has, ironically, been traced back to the vested interests of multinational companies benefiting from having their staff proficient in English to further their international business relations (Benesch, 2001), while aspects of the “academic” writing syllabus can be traced back to prejudices in the academy or to patronizing preconceptions about EFL students’ ability in formal writing (Hyland, 1996; Hocking & Toh, 2010).

Pedagogy and Classroom Interaction

Critical analyses have also sought to examine discourses relating to pedagogical processes and classroom interaction. Typically, such analyses address issues such as methodologies or approaches that are partial toward certain cultures, socially privileged groups, or particular conceptions of the ideal teacher (e.g., the native speaker) or the L2 learner. They have uncovered how even the notion of teaching “method” is itself weighted, how perceptions of “good” teaching can be associated with colonial control, or as otherwise something preexisting, erudite, or heuristic, to be passed from expert to novice (Wilson, 1992; Canagarajah, 1999; Kumaravadivelu, 2003; Warschauer, 2002). Underlying assumptions concerning the interactive or learning styles and strategies of certain types or groups of learners (e.g., the “Korean” or “Indian” student, the “rote” learner, the “passive” learner, the “migrant” learner) are also scrutinized for fallacious assumptions or bias, even as they come to bear on discourse concerning “good” ways to teach students that are stereotyped in this way.

Testing and Evaluation

Discourses relating to testing, evaluation, and assessment have been the focus of critical analyses, principally because testing and evaluation have been viewed as bastions of regulation and control. Critical analyses in this area have looked, in particular, into how testing and assessment can be ideologically laden, steeped in outdated practices, inequitable, classificatory, or blatantly divisive, perpetuating unequal power relations and divisions in society. Work has also been done on how test instruments can be reductionist, atomistic, decontextualized, and narrow in scope and focus, leading to learning experiences that are not practical, realistic, or enlightening in terms of both feedback and positive washback for students (Boyd & Davies, 2002; Murphey, 2004; McNamara & Roever, 2006). Extremity of example can be found in Murphey (2004), which explores official rhetoric offered in place of changes to Japanese university entrance examinations that would promise fairer and more professional testing practices.

Power Differentials in School and Community

Institutional, supervisory, superintendent, and regulatory discourses (governmental, state, and local) concerning schooling and the community have come under critical scrutiny. Critical analyses have sought to examine how such discourses disparage, denigrate, or otherwise regulate certain sectors of the community—migrants or children of migrants, foreign workers, or returnees—and how such discourses are mobilized in oppressive ways or for oppressive ends (Wodak, 1996; Giroux, 2004; Kubota & McKay, 2009). Kubota and McKay (2009), for example, reveal how bias can run deep in community attitudes toward certain cultures. In their particular illustration, bias against Hispanic cultures in parts of Japan is seen as affecting language learning in the community.

Policy and Planning

In applied linguistics, critical analyses of discourses in education have targeted inequalities that stem from language policy and planning concerning lingua francas, languages of access, status, and power in contrast with minority or marginalized languages (Tollefson, 1991; Phillipson, 1992; Fishman, 1996; Lin & Martin, 2005; Oda, 2007). Critical analyses of other areas of education policy include studies of policy directions of different countries concerning academic, technical, or vocational education, education in the creative and fine arts, or even religious education. Findings have revealed that education policy and planning are a function of various political or social agendas. Minority races, languages, and cultures, for example, have been disadvantaged through many a skewed education policy.

Colonial Discourses

The discourses of colonialism and neocolonialism have also come in for critical scrutiny. Such discourses are critiqued for resulting in prevailing hegemonies that come to bear on education policies and practices which result in asymmetrical North–South, inner-circle and outer-circle relations as well as dominant and subordinate identities among learners and other stakeholders. Criticism of the British Council’s approach to ELT is a commonly quoted example of colonizing discourses at work, as would be the reification of the White native speaker as ideal teacher of English (Phillipson, 1992; Pennycook, 1998; Fishman, 1996).

Current Trends

An important aspect of the critical analysis of discourse in education has been analysis focusing on the influence of societal and global trends on education, including globalization, internationalization, marketization, neoliberalism and commoditization in, as well as the commodification of, education (Kubota & McKay, 2009; Kubota, 2010); a further focus of attention is how these influences affect future work orders and human subjectivity, not least as to how schools, universities, vocational and technical colleges should fit into worldviews that legitimize a belief in, for example, the free market economy. A “recent discovery” under this subheading would be Kubota’s (2010) description of the resurgence of interest in prewar national education policies in Japan and how education can be mobilized to foster patriotism and self-sacrifice among the young.

Moral and Ethical Referents

The critical analyses of discourse discussed above have been linked to sociocultural, moral, and ethical referents including various conceptualizations of freedom, liberty, and empathy, as well as equal opportunity for access to portals, symbols, tools, and technologies of power across gender, race, class, status, and also referents pertaining to equity, dignity, public good (Giroux, 2004), and social justice (van Dijk, 1984). Such analyses have also drawn on educational referents such as the nature of learning as well as the right to learn, which in themselves are socially founded and representational constructs, as well as on concerns over how different trends in (current and emergent) history present moral and ethical dilemmas for educators and policy makers alike. Such analytical studies invariably turn to sociohistorical, sociopolitical, as well as sociocultural epistemologies for answers to why so much of what takes place in education results in outcomes that are regarded as oppressive and exclusionary.

Academic Literacies

In relation to epistemological views of the nature of knowledge and learning, an important area of study linked to critical analyses of discourse in education is the body of research into academic literacies. A group of scholars writing in the academic literacies tradition has since the 1980s sought to argue that ways of knowing and meaning are not apolitical or neutral, but are discursively and rhetorically situated within social and political structures and discourses in society. The work of these scholars has come to hold considerable bearing on an understanding of critical analysis of discourses in education, particularly in the way their work has sought to unpack the social processes of discourses—seen as pivotal in critical discourse analysis (van Dijk, 1985)—with specific attention to discourses relating to education and the way knowledge is structured, constructed, construed, controlled, and rendered. Lillis and Turner (2001) for example, illustrate how the discourse behind so-called “scientific” knowledge can be traced to common disagreements within the Royal Society, where scientists argued to convince their peers about the veracity of their theories.

Academic literacies scholars, moreover, find commonality in their assumption that language can be mobilized to control meaning (Fowler, Hodge, Kress, & Trew, 1979), the result of which is that certain meanings are privileged and counted as being “academic” while others are marginalized, particularly when it comes to the written genres of the academy.

Real-life illustrations can be found, for example, in Lillis (2003). Lillis notes how Black working-class values or certain ethnically situated religious values which hold meaning for students coming from various quarters of (in this particular case) British society can be marginalized and deemed as “nonacademic” when set alongside values of an academy that is predominantly associated with the White middle class. Lillis (2003) describes how tutors can put categorical remarks like “not really relevant” against arguments that do not proceed from values and assumptions held by a powerful majority. Relating the experience of a student, “Mary,” coming from a Black working-class background, Lillis tells how Mary responds to an essay question on whether the term “underclass” adequately describes the social position of ethnic minorities in Britain. Mary’s argument that ethnic minorities have made significant contributions to the cultural richness of British society in both music and popular culture is deemed irrelevant. The point made is that it is important in academia for students to be allowed to enter into discussions about the kind of meanings that they wish to put across in their academic work, meanings which students from a diversity of backgrounds and sociohistories hold as being important. Hence, demystifying the “academic” in academic writing (through the unveiling of ideologies that although not immediately apparent do influence what it means to be “academic”) has been part of this body of work. Academic texts and knowledge are exposed as being, in fact, staged attempts at enacting and privileging certain viewpoints while maintaining a facade of transparency, neutrality, objectivity, detachment, methodicity, and rationality (Turner, 2004; Scott & Turner, 2004; Molle & Prior, 2008). Academic knowledge is exposed as being sociohistorically situated, intertextual, dialogic, and in reality embodies a diversity of voices, rather than a monologue or a monolith of “authoritative” authorial information, when put through the rigors of epistemological cross-examination. Hence, what van Dijk (1985, p. 7) calls “White middle-class discourse style” is revealed as being very much a sociopolitical construct that would be out of place in multiethnic and multicultural schooling situations. In this connection, academic literacies scholars argue that educators should foster a critical awareness of language among students to enable learners of diverse backgrounds to become accustomed

to different ways of knowing, meaning, selecting, and arguing (Lillis, 2003; Myers & Beach, 2004), thereby facilitating deeper critical reflection on the way in which identities, meanings, and knowledge are constructed. This can only enrich and invigorate the process of knowledge creation.

Future Research

While the body of work that critically analyses discourses in education is now substantial in terms of critiques of discourses to do with policy, practices, and stakeholder subjectivities, there is nevertheless going to be room for continued efforts in the area. This is principally because matters to do with ideology and power are subject to constant and ongoing negotiation and dispute, even as fresh sociocultural narratives, political rhetoric, and cultural forms emerge in the education arena. In addition, whether the focus of the analyses be monologic conceptualizations, normalizing categorizations, reductionist discourses or even monolithic, minimalizing or totalizing theorizations or practices, having them dialogized through critical analyses becomes an important way of maintaining vigor and rigor in education.

The ideologies and power relations that come out of current trends such as the way education institutions are, in various instances, being run like (or as) businesses, complemented by influential (but neutral-sounding) rhetoric, including catchwords such as "market analysis," "cost-benefit ratios," "accountability," "financial viability," "institutional ranking," "client preferences," or "client feedback" becoming part of emergent narratives in administrator-speak, the mercantile and infomercial discourses that institutions (especially universities) have plugged into, will provide good opportunity for future research into the way teaching, learning, and knowledge creation will be affected. Closely related are the discourses surrounding the ways in which institutions hire, retire, fire, or promote faculty members, which can be examined for the rhetoric of the work orders that come with marketization and neoliberalism, as well as the rhetoric capturing the language and work of administrators and bureaucrats when it comes to discussions about departmental or institutional closures, mergers, or "viability." In this connection, with economic pressures bearing on public and private institutions alike, it would also be interesting for studies to be carried out on the conversations around fiscal as well as staffing cutbacks, downsizing, devolution, mergers, accreditation, and other similar activities that are becoming increasingly common. Alongside this is now the practice of having people with "real-world" or "market" experience coming into universities and other institutions either to teach, or more often, as senior administrators actively involved in decision making and advising on the way knowledge should be treated, or on the way teaching or learning should be carried out, or other aspects of the vision and mission of educational institutions.

Looking further, matters that pertain to oppression, including racism, racialization, and cultural imperialism, the persistence of oppressive methodologies and pedagogies, the continued resistance to practices that are more liberating or emancipatory, as well as popularized myths, artifacts, entities, symbolisms, or conceptualizations (and the cultural practices linked to them), the foreign expert, the technocrat, the overseas degree, market experience, the standardized test, the course feedback form, the bell curve, the international school, the baccalaureate or ISO accreditation, should all be subject to objective and critical examination.

In applied linguistics and language teaching, and in particular, English-language teaching, such trends as the creation of "English only" universities in situations where education has been carried out in a national language (e.g., Thailand and Japan), the design and delivery of courses taught only in English in traditionally EFL situations, the late but furious demand for courses in English for "academic" purposes (which is very much an

offspring of the aforesaid developments), the rush on the part of universities, private companies, NGOs and even religious organizations toward providing instant or ready qualifications in TESL, TEFL, and TESOL, as well as widely commercialized but reductionist methods of testing and measuring achievement in language learning, present challenges for continued critical attention.

Critical analysis of discourses in education thus remains an area for ongoing research.

Critical Analysis of Multimodal Discourse

THEO VAN LEEUWEN

The term “critical analysis of multimodal discourse” suggests a merger of two distinct fields of applied linguistics: critical discourse analysis and multimodality. At present it cannot be said that such a merger has taken place. Unlike critical discourse analysis and multimodality, the “critical analysis of multimodal discourse” is not—or not yet—a field with its own conferences, journals, edited books, and so on. Although some critical discourse analysts focus on multimodal texts and some multimodal analysts take a critical stance, they are in the minority, in both fields, despite the increasingly important role of multimodal discourse in many social and political contexts, especially since the emergence of the Internet. It is therefore best to separately survey multimodal work within the tradition of critical discourse analysis and critical work within the tradition of multimodality; and to then assess whether—and if so, to what degree—a coherent field of study has begun to emerge, even though it does not as yet have a clear academic identity of its own.

Critical Discourse Analysis and Multimodality

Critical discourse analysis, as it emerged in the late 1980s, is based on the idea that text and talk play a fundamental role in maintaining and legitimating inequality, injustice, and oppression in society. It employs discourse analysis to show how that happens, and it seeks to spread awareness of this aspect of language use in society, and to argue explicitly for change on the basis of its findings. Methodologically eclectic, it uses a range of linguistic methods and also strongly engages with critical social theory—Fairclough in particular has insisted on grounding critical discourse analysis in critical social theory (Chouliaraki & Fairclough, 1997). But its claim to validity ultimately rests on linguistic methods of analysis and linguistic arguments. Critical discourse analysts may, for instance, study the use of pronouns in political speeches to show how pronouns include some and exclude others from being “British” or part of “the people,” and to discursively construct government views and policies as those of “the people” (Fairclough, 1989, pp. 178ff.).

The social and political issues critical discourse analysts have studied over the past 20 years vary widely. There has been a great deal of work on racism and anti-Semitism and on immigration and asylum. More recently, neoliberalist discourses have become an important focus. But the pages of key journals such as *Language and Politics*, *Critical Discourse Studies*, and *Discourse and Society*, and collections such as Toolan (2002), show that critical discourse analysts have addressed many other issues as well, including gender, war and terrorism, and welfare and unemployment, to mention just a few. The texts they analyze also vary. Although there has been a tendency to analyze speeches by politicians, parliamentary debates, and media reports and editorials, critical discourse analysts have also analyzed school textbooks, advertisements, the books of management gurus, transcripts of doctor–patient and workplace meeting interactions, and much more. And as a glance at the contents of *Discourse and Society* will demonstrate, this work has increasingly come from all corners of the world.

2 CRITICAL ANALYSIS OF MULTIMODAL DISCOURSE

In all these fields communication has become much more multimodal, yet most work in critical discourse analysis remains firmly monomodal, looking only at written and spoken language. On average, only 1 in 17 articles in key journals such as *Language and Politics* and *Critical Discourse Studies* critically analyzes multimodal discourse, and only a handful of critical discourse analysts strongly argue for a multimodal approach, for instance Chouliaraki in her work on the televisual representation of suffering (2006), Machin in his work on image banks (2004) and computer war games (Machin & Suleiman, 2006), and van Leeuwen in his work on visual racism (2000), in which he argues that racist stereotypes from the colonial era persist most strongly in visual rather than verbal texts, and in comic strips, advertisements, and other forms of popular culture rather than in more factual and “highbrow” texts. For this reason he urges critical discourse analysts to pay greater attention to texts of this kind:

Visually communicated racism can be much more easily denied, much more easily dismissed as “in the eye of the beholder” than verbal racism . . . it is for this reason that a consideration of images should have pride of place in any inquiry into racist discourse. If images seem to just show “what is,” we need to show that that may not always be quite so. If images seem to just allude to things and never “say them explicitly,” we need to make these allusions explicit. (2000, p. 335)

For such an inquiry to rate as critical discourse analysis, however, it has to be grounded in some kind of linguistics analysis. An analogue to the linguistic methods used in critical discourse analysis therefore has to be developed for modes of communication other than language. As will be seen in the next section, this has in fact happened in the field of multimodality, even if not specifically for the purpose of facilitating critical discourse analysis.

Multimodality and Critical Discourse Analysis

The term “multimodality” has, over the past 20 years, been taken up by linguists and discourse analysts to denote the integrated use of different communicative resources, such as language, image, sound, and music, in multimodal texts and communicative events. Once linguists moved from studying isolated sentences to studying texts, they realized what they should have known all along: that communication is multimodal, that spoken language as it is actually used cannot be adequately understood without taking nonverbal communication into account, and that many forms of contemporary written language cannot be adequately understood unless we look not just at language, but also at images, layout, typography, and color. In the 1960s French structuralist semioticians began to apply linguistic methods to the study of news and advertising photographs, films, and many other modes and media. More recently the work of Halliday (1978, 1985) has inspired “grammars” of semiotic modes such as visual images (O’Toole, 1994; Kress & van Leeuwen, 1996), sound and music (van Leeuwen, 1999), and body action (Martinec, 2000, 2004), to name just a few. By now, multimodality has its own biannual conference and a range of edited books.

The work of multimodal discourse analysts is not necessarily critical in the sense described above. Multimodal discourse analysis is often applied to education, in studies of the development of multimodal literacy in young children (Kress, 1997), of multimodal learning resources, including textbooks, toys, CD-ROMs, and the Internet (Jewitt, 2006), and of multimodal classroom interaction, and such work often focuses more on heralding what is to come than on critiquing what is. It sees multimodality as a key to better learning and stresses that the learning potential of different modes needs to be better understood by

teachers, and that multimodal literacy needs to be more fully integrated into the curriculum in ways based on what can be learned from studying the spontaneous learning of very young children, or from studying other forms of informal learning, such as playing with toys or computer games. In the same vein, multimodal analysis is applied to improving communication and learning in museums, tourist communication, health and workplace communication, and so on.

Nevertheless, there has been, from the beginning, a critical strand within multimodal discourse analysis. This was to a large extent due to the example set by Gunther Kress and Bob Hodge (Kress & Hodge, 1978, 1988). Their first book, *Language as Ideology* (1978), was a forerunner of critical discourse analysis. Influenced by Whorf and Halliday as well as Marx, they showed how grammatical systems allow reality to be constructed in different ways, and how they therefore can be used to ideological ends. In their second book, *Social Semiotics*, they extended this to other modes of communication, showing, for instance, how the grammatical system of modality can be applied to visual images, for instance in comic strips, where it may use different signifiers but nevertheless does the same kind of communicative work it does in language, creating "social definitions of the real." They showed not only how the grammar of modality was deployed in the press to lessen the credibility of left-wing politicians in the Thatcher era in the UK, but also how it was used in comic strips to make readers identify with the "good" characters and distance themselves from "bad" characters (Kress & Hodge, 1988, pp. 121ff.).

This work was further developed in Kress and van Leeuwen's *Reading Images: The Grammar of Visual Design* (1996). This book was on the one hand more technical, describing visual grammatical systems by means of Hallidayan system networks, and providing detailed methods of analysis, with clear formal criteria, which have been taken up in a range of contexts, many of them not related to critical discourse analysis. On the other hand, they regularly gave examples that demonstrated the potential of their methods for critical discourse analysis. One of their key examples was taken from an Australian social studies textbook for primary school children titled *Our Society and Others* (see Kress & van Leeuwen, 2006, pp. 45–7). The book's chapter on Aboriginal Australians included a section on their material culture, and this section included a page on which two 19th-century engravings were shown side by side: on the left, a picture of Aboriginal artifacts, formally arranged, and shown against a white background (a stone axe, a bark basket, and a wooden sword); on the right, a moonlit scene of two British colonists stalking up toward a group of Aborigines seated around a fire, their guns ready. Kress and van Leeuwen used these pictures as examples of specific visual grammar structures. The picture of the Aboriginal artifacts was an example of a "classificational" image, an image in which a number of different objects or people are arranged symmetrically and given the same size, the same orientation to the horizontal and vertical axis, and so on, so as to signify that, somehow, they belong to the same category, even though that category is not always verbally labeled. The picture on the right was an example of a "narrative" image, in which the two main "volumes" of the picture, the two most visually salient entities (the "British" and the Aboriginal people round the fire) are linked by a "vector," an oblique line (here formed by the gun) running from the one to the other and signifying an action ("aiming a gun at") in which one "volume" (the one from which the vector emanates, i.e., the British) is the Actor, the entity that does the action, and the other the Goal, the entity that is affected by the action (here the Aboriginal people). But Kress and van Leeuwen also pointed out that such structures construct particular versions of the realities they depict. It would have been possible to have a "classificational" picture of antique British guns, and a "narrative" picture of Aboriginal people attacking the colonists, for instance. Moreover, the captions offered different constructions of the same events. The caption of the "narrative" picture, for instance, read "The British used guns," thus eliminating the affected party, the Aboriginal

people. Finally, the left–right structure realized a “Given–New” relation in which the picture of the “primitive” Aboriginal tools is the Given, and the picture of the gun-using colonists the New, the element treated as not yet known to the readers and therefore containing the key message. Such observations, based on well-grounded methods of analysis, can lead to critical analyses—the chapter in the school book, for instance, showed the colonization of Australia and the subjection of its Aboriginal inhabitants as the inevitable outcome of British technological superiority.

But Kress and van Leeuwen did not explicitly describe their methods as a form of critical analysis. They just revealed an interest in multimodal critical discourse analysis through their choice of examples, and through the often brief interpretations of these examples. And this has remained the situation in multimodal discourse analysis. In the most recent international conference on multimodality, only 12 of the 123 papers had an explicitly critical aim, going by the abstracts (Fifth International Conference on Multimodality, 2010).

Two Examples of the Critical Analysis of Multimodal Discourse

I will, finally, discuss two examples of the critical analysis of multimodal discourse in a little more detail. Machin (2004) analyzed how, in the Internet image bank Getty Creative Images, photographic images can be searched for the concepts they express, rather than for the people, places, and events they record and document. The visual expression of concepts by means of staged photographs has of course long existed in advertising, but today, Machin shows, it also extends to the editorial content of newspapers and magazines, where we traditionally expect “records of reality.” The images in the Getty Creative Images image bank leave space for words and have restricted color palettes to facilitate their use in page layout, and they are generic rather than specific, using a range of decontextualizing devices and a restricted vocabulary of attributes to indicate the identity of people and places (hard hat + rolled up blueprint = “architect”; laptop = “office”; nondescript skyscraper = “city,” and so forth). They are therefore deliberately designed to be used in multiple contexts, and sold over and over. And the concepts they seek to illustrate, labeled for ease of searching, focus on the positive values of contemporary corporate discourse—freedom, creativity, innovation, determination, concentration, spirituality, well-being, and so on—and are void of all political content: pictures of “freedom” mostly show people jumping for joy, or in an open-topped car on a virtually empty road, just as in the advertisements—with just a few images of the Statue of Liberty and the American flag thrown in, with or without warplanes overhead.

Van Leeuwen (2008) developed a framework for analyzing how the identity of “social actors” can be signified verbally, visually—and with the “Playmobil” range of toy figurines and accessories. Social actors can, for instance, be represented as individuals or as “types,” and individually or collectively, and they can be functionalized (categorized by what they *do*, e.g., their profession or some kind of activity), or classified—categorized by what they are deemed to *be* (e.g., by gender, class, ethnicity, or nationality). His analysis demonstrates that many identity categories can be expressed verbally as well as visually. But not every category can be expressed in every mode, and the ways in which the same categories are expressed in different modes does add further meanings and values. The minimalistic characters of Playmobil offer a range of such categories, van Leeuwen shows, a microcosm of the social world. But even this system constructs reality in specific ways. The “ethnic family” box, for instance, contains a father, a mother, and three children, all with brown skin and identical hair color, and with a mother who wears her hair in a bun. The “family” (no further qualification) comes in a box with a father, a mother, and two children, all pink-skinned and with different hair colors, hence with a modicum of individuality. And

here the mother has long blonde hair, signifying youthful feminine attractiveness. A message is built into the “system”—“ethnic families” have more children, less individuality, and women who grow old earlier.

Conclusion

A few things can perhaps be said by way of conclusion. The field of multimodality has produced reliable methods that can be used for the critical analysis of multimodal discourse. It is itself, however, only marginally concerned with critical discourse analysis. Instead it tends toward a celebratory view of multimodality, as a tool for the design of effective communication in education, museums, hospitals and clinics, and so on. Critical discourse analysis is duty bound to plead for caution here. Contemporary corporate discourse is replete with positive self-affirmation, relentless optimism, and unquestioned belief in progress, and this kind of discourse increasingly infects other fields as well. This can be engaging and infectious, but it can also mask or silence other realities that are not quite so positive.

Meanwhile critical discourse analysis itself needs to pay more attention to the multimodality of contemporary communication, because the discourses that need the scrutiny of a critical eye are now overwhelmingly multimodal and mediated by digital systems that take multimodality entirely for granted.

Critical Analysis of Political Discourse

JOHN FLOWERDEW

The term “politics” derives from the Greek Πολιτικά (*politika*), as used in Aristotle’s *Politics*. That volume dealt with the government of the state, but also, more broadly, all human interactions where power is an issue. Critical analysis, within the context of critical discourse analysis (CDA), has focused on aspects of both of these dimensions of politics. CDA thus considers issues such as political economy (e.g., globalization), political debates broadly defined, media discourse, organizational discourse, racism, gender issues, ecological issues, and identity (including national identity). Since the 1980s, a considerable amount of discourse analysis has focused on politics in the narrower sense of the term (e.g., Chilton, 1985, 2004; Atkinson, 1988; Lakoff, 1990; Wilson, 1990; Harris, 1991, 2001; Scannell, 1991; Schaffner, 1997), although the focus of this work is not necessarily critical. The focus of this entry will be mainly, although not only, on the more narrowly defined approach to political discourse. Within this more restricted definition of political discourse analysis, CDA has focused on such texts as speeches, interviews, radio phone-ins, public meetings, manifestos, constitutions, and treaties.

CDA’s immediate antecedents are to be found in the work of critical linguists working at the University of East Anglia (Fowler, Kress, Hodge, & Trew, 1979) and broader influences include the work of linguists and political economists such as Louis Althusser, Mikhail Bakhtin, Pierre Bourdieu, Michel Foucault, Michael Halliday, Antonio Gramsci, and Jürgen Habermas. The approach also draws on classical rhetoric, text linguistics, sociolinguistics, applied linguistics, and pragmatics. Much of this early work focused on (political) news analysis.

The basic premise of CDA is that language is a form of social practice and that, as with all social practices, power is an important variable. The focus is on how power is manifested in discourse, or text and talk. The relationship between power and language is not seen as deterministic, however, but as variable, power influencing language and language affecting power. It is not possible, therefore, to “read” power relations “off the page” or text. That being said, particular linguistic forms may be used in the expression of power, an early insight being the distinction in many European languages between first and second pronouns (*tu/vous*) of Brown and Gilman (1960/1972), whereby the *tu* form may be used by the more powerful person, but the *vous* form is required in return. Other linguistic features which have been extensively studied include transitivity (in the systemic function sense of the term), lexis, phonology, and various features of genre, among many others. CDA is not limited to written or spoken text, but also considers other semiotic systems, such as the visual and acoustic, which may equally affect meaning.

CDA also assumes that discourse is controlled by gatekeepers who have the power to influence social beliefs, values, and ideologies, and determine what is and what is not acceptable discourse. Although language power may be held by gatekeepers, it is not always a question of “heroes and villains” (van Dijk, 1993); the powerful may not be aware of their abuse of discourse. Indeed, it is a precept of CDA that discourse may be *naturalized*, embodying taken-for-granted assumptions about people’s roles in society, and it is the goal of CDA to reveal such naturalizations. The term “critical” in the CDA acronym refers not to negative evaluation, but in the sense of *critique*, with the goal of a positive outcome.

2 CRITICAL ANALYSIS OF POLITICAL DISCOURSE

Thus CDA focusing on racism has the goal of reducing inequality, not just criticism of those enforcing it.

Because it is not possible to “read” discourse off the page, and because its underlying meanings may be taken for granted, CDA places much emphasis on the role of context in analysis. That is, other data, in addition to the immediate textual data, may be employed in the analysis, such data typically taking the form of other texts, participant interviews, and other forms of ethnographic data. Because of this, CDA is often interdisciplinary, involving researchers from other fields, such as political economists, sociologists, anthropologists, and historians. Such triangulation enhances objectivity and mitigates accusations of subjectivity and bias in interpretation, which have been made by some, most notably Henry Widdowson, in a famous exchange with Norman Fairclough (Widdowson, 2004). Arguments against such accusations of bias are that, on the one hand, it is spurious in any research to expect objectivity, any researcher being socially positioned, and that at least CDA is open about its political orientation; and, on the other hand, one can appeal to such measures as representativeness, reliability, completeness, and accessibility, as well as the above-mentioned triangulation, as in other forms of qualitative research in the human sciences.

Following from its openly political agenda, some CDA practitioners argue for active political engagement beyond the academic publication (e.g., Fairclough has engaged with journalists, and Ruth Wodak often takes on the role of what she refers to as a “public intellectual”). Wider dissemination of the findings might include newspaper commentaries, television and radio broadcasts, training seminars, and further education courses (Reisigl, 2008).

Reacting to what he sees as the “deconstructive” and rather negative nature of CDA, Martin (1999) has put forward the idea of a positive discourse analysis, where, instead of analyzing the abuse of power through language, the focus would be on the emancipatory power of positive discourse, of how language power can be used to bring about positive effects in the world. A danger of this, however, is that such work might be turned into a form of propaganda for the status quo. In so far as the term “critical,” as defined above, already incorporates the notion of change and improvement, it might also be argued that such a discourse is no longer necessary. Having said that, while it may be agreed that dominant social structures tend to lead to naturalized discourses, there do exist, in situations of dominance, instances of resistance to such conventionalized discourses. It is worth noting that CDA has given little attention to such *agency*, in favor of more attention to *social structure*, as compared to the educational linguistics literature, where under the influence of Vygotskian sociocultural theory, more attention has been paid to agency (e.g., Lantolf, 2000); perhaps CDA could redress this imbalance (Flowerdew, 1997, 2008).

Five figures are generally seen as key in CDA: Norman Fairclough, Gunther Kress, Ruth Wodak, Teun van Dijk, and Theo van Leeuwen (although Kress and van Leeuwen have been more active in recent times in other areas, in educational discourse and visual design). All have focused on political discourse, to a greater or lesser degree. According to Wodak (2001), this group of researchers came together at a meeting in 1991 organized by van Dijk in Amsterdam and which was seen as the “formal” initiation of CDA. Also, the group contributed articles to a special edition of *Discourse and Society* on CDA in 1993. That being said, it is important to emphasize that CDA has never been a “school” in the strict sense of the term, each member of the group following his or her own approach. Other figures more or less central to the movement include Carmen Caldas-Coulthard, Jan Blommaert, Lilie Chouliaraki, Robert de Beaugrande, and Siegfried Jäger. If CDA is not a school, neither is it a *theory*. Van Dijk (1993) prefers to call it an *approach*. There is disagreement among practitioners as to whether it is a theory, an approach, a method, or a combination of two or more of these (Flowerdew, 2008).

In terms of topics, Fairclough has focused on discourse and power (Fairclough, 2001), on discourse and social change (globalization, neoliberalism, knowledge economy), and on media discourse. He takes a theoretical approach, usually examining relatively small extracts of text in order to illustrate concepts such as orders of discourse, intertextuality, hybridity, and voice. On the social side, he is influenced by the political economists Laclau and Mouffe (1985/2001), among others. In terms of political engagement, his book *New Labour, New Language?* (2000) is an attempt at a more popular contribution aimed at the general public, while his earlier edited collection *Critical Language Awareness* (1992) has argued for a systematic critical approach to language that can be carried over into schools and to the public at large. A summary of a relatively recent paper (2005) gives an idea of his approach. In this paper, he makes it clear that his is a specific version of CDA

which is characterized by a realist and dialectical-relational theory of discourse, a methodology which is oriented to constructing objects of research through theorizing research topics in dialogue with other areas of social theory and research, and selecting methods which are in part inherent to this version of CDA and in part dependent upon the particular object of research.

In this particular study, Fairclough focuses on elements of political transition in Romania, the "knowledge-based economy," focusing on one discourse phenomenon, recontextualization.

Like Fairclough, Wodak's research agenda focuses on the development of theoretical approaches to CDA. She combines elements of ethnography, argumentation theory, rhetoric and systemic functional linguistics, focusing on gender, language in politics, prejudice, and discrimination. She is best known for her work on political discourse concerned with anti-Semitism in Austria, where she developed, with colleagues, her *discourse-historical* approach. She has also studied the discourse and politics of the European Union, focusing on issues including unemployment, NATO, neutrality in Austria and Hungary, the discursive construction of European identities, racism "at the top," and parliamentary debates on immigration. In general, Wodak's approach is much more ethnographic than Fairclough's. She is also interested in the role of history in discourse (Martin & Wodak, 2003). Indeed, as a multidisciplinary enterprise, one role for CDA is historiography, the writing of history.

Developing earlier work in the 1970s on the psychology of text processing with Walter Kintch (van Dijk, 1977), van Dijk's contribution to CDA has been in developing a sociocognitive model, with a focus on the discursive reproduction of racism, in particular, by politicians, journalists, scholars, and writers (which he refers to as the "symbolic elites"), and in printed news media. Van Dijk's sociocognitive approach attempts to bridge the gap between society and discourse. Working from a mental models approach, van Dijk sees discourse, processed via long-term and short-term memory, as shaping our perceptions and understandings. Stereotypes and prejudice can occur when such models become overgeneralized. In relation to this work, van Dijk has been interested in developing theories of ideology and context. He founded the leading journal devoted to CDA, *Discourse Studies*, which he still edits.

Although, as already mentioned, in his later work Kress has moved away from CDA, as one of the founding members of the group, his is an important contribution. Already, in earlier work, with Fowler (Fowler et al., 1979) and Hodge (Hodge & Kress, 1979/89), he was a leading theoretician for critical linguistics, focusing on ideology in news discourse. His later book (Kress, 1989) is significant in setting out some important principles for CDA, as is his contribution to the special edition of *Discourse and Society*, referred to above, "Against Arbitrariness" (Kress, 1993). In this paper, as in his other contributions (echoing Whorf), he argues that a fundamental understanding for a critical approach to discourse

4 CRITICAL ANALYSIS OF POLITICAL DISCOURSE

is the “motivated” relation of the signifier and the signified, how producers and readers of signs are motivated by their backgrounds and social histories which make up the relevant context, including the social structures and the power relations existing therein. He also argues that a focus on “bland” texts might be more productive than texts which are more obviously ideologically marked and for the intrinsically multimodal nature of texts.

Van Leeuwen is influenced by his background in film and television and emphasizes the overall semiotic nature of discourse (van Leeuwen, 2004), considering not just text, but acoustic and visual elements of discourse, as well as material action. With regard to CDA, and in accordance with his overall semiotic approach, van Leeuwen (1996, p. 33) has stated that

there is no neat fit between sociological and linguistic categories and if Critical Discourse Analysis, in investigating for instance the representation of agency, ties itself in too closely to specific linguistic operations or categories, many relevant instances of agency might be overlooked.

Van Leeuwen’s work is less focused on politics in the narrow sense of the term, although he did conduct a large-scale project studying globalization and discourse (Machin & van Leeuwen, 2003).

Returning to the work of Fairclough, perhaps the leading figure in CDA, and to the dichotomy presented at the beginning of this entry regarding the narrower conception of the political, concerning the government of the state, and the broader definition, concerning all human interactions where power is an issue, Fairclough proposes that the boundary between these two poles is ever changing, depending upon what he refers to as the prevailing order of discourse. By order of discourse he means “the structured configuration of genres and discourse which constitutes political discourse, the system . . . which defines and delimits political discourse, at a given point in time” (Fairclough, 1998: 146). Contemporary political discourse articulates together, Fairclough argues, the orders of discourse of the political system (conventional, official politics), the media, science and technology, grassroots sociopolitical movements, and ordinary private life and it does this in an unstable and shifting configuration. Fairclough argues that a way into these orders of discourse is via their agents, on the one hand, and their genres, on the other.

This brings us to Flowerdew’s work, which has focused on the political discourse surrounding Hong Kong’s change of sovereignty from Britain to China. This work, which has been going on since the early 1990s, approaches this discourse from the perspective of the political leaders—the last British governor and the first two chief executives of what is now a special administrative region of China—and focuses on such genres as public meetings, interviews, set piece speeches, and televised addresses. This analysis has led Flowerdew to investigate some important features of political discourse, such as the exertion of language power, the manipulative use of language, cross-cultural political discourse, the notion of political “myth,” the discursive construction of (national) identity and racialized discourses (e.g., Flowerdew, 2011). It is unusual in political discourse analysis in focusing on one specific context over a long period, allowing for a fuller understanding to develop of the social context and orders of discourse in question.

In terms of methodology, Reisigl (2008), based on his experience working with Wodak’s research team in Vienna, has listed a sequence of steps for the systematic critical analysis of political discourse, as follows:

1. Consult previous knowledge about the sociopolitical problem that possesses linguistic aspects.
2. Collect (triangulated) discursive data for analysis.

3. Prepare and select specific data for analysis.
4. Formulate research questions and hypotheses based on rapid checking of data or part of it.
5. Pilot the analysis to adjust analytical instruments and further spell out research questions.
6. Develop detailed case studies; these can operate at macro or micro linguistic levels or at the level of context; they lead to an overall interpretation of the results of analysis, taking into account the social, historical, and political context of the analyzed data.
7. Formulate critique to reveal problematic discursive strategies, solve specific problems of communication, or improve communication; this is based on ethical principles such as democratic norms and human rights; it focuses on opaque, contradictory, and manipulative relations among power, language, and social structures and commits itself to cognitive and political emancipation (and improvement of communication).
8. Apply results, e.g., publication of a book/articles and/or more widely disseminated outlets.

To conclude, there are two peer-reviewed journals which are devoted to CDA and which deal with political topics (in the narrow sense): *Discourse and Society* and *Critical Discourse Studies*. In addition, *Journal of Pragmatics* and, especially, *Journal of Language and Politics*, regularly publish articles devoted to the critical study of political discourse.

Critical Applied Linguistics

SINFREE MAKONI AND BUSI MAKONI

The term “critical” when used with reference to poststructuralist and postmodernist scholarship is neo-Marxist and influenced by Derrida (1970) and Foucault (1970). Critical scholarship is “restless” (Pennycook 2004) as it questions assumptions made in the parent discipline. Criticality is a process of engaging with power and social inequality both within and outside applied linguistics. Nonetheless, critical applied linguistics (CAL) is not opposed to power but to its effects. CAL is skeptical of concepts such as the native speaker, language, identity, and agency.

There are a number of different prisms through which CAL may be viewed. Given our personal biographies our view of CAL is postcolonial. A postcolonial reading of CAL is not a total rejection of “Westcentric frameworks of analysis and assessment” (Shi-Xu, 2009, p. 239). After all, not all Westcentric perspectives are inadequate in other contexts. In fact, some can be used productively in non-Western contexts. The important issue, therefore, is not the origin of the theories but what they seek to accomplish and the social-linguistic issues they address. Some Western frameworks may be incompatible with non-Western realities whereas in certain cases frameworks originating from outside Western countries may enrich Western perspectives (Shi-Xu, 2009). It is against this background that our version of CAL should be understood and evaluated.

Most CAL researchers subscribe to social constructionism. As Stead (2004) points out, “social constructionism is anti-essentialist.” It questions the centrality of categories and dichotomies because these “divisions are not reflective of a reality but are often political, thus serving the interests of the groups who devised them.” Social constructionism then shifts the focus to how relationships are constructed. Social constructionism is appealing to CAL scholars because its aim is “to re-examine received or mainstream viewpoints, to produce new interpretations or meanings.” By so doing, it disrupts the exploitation associated with institutionalized discourses. For instance, “social constructionism avoids essentializing . . . languages as if they exist independently.” After all, “knowledge is contextually embedded. Multiple realities are negotiated in historical time” (Stead, 2004, pp. 391–2). Postcolonial CAL does not dismiss essentialization. Within postcolonial CAL, tension exists between social constructionist and essentialist thinking or the proclivity to articulate social constructionism in essentialist discourse. The issue is not whether to essentialize or not, but rather the degree and extent to which it takes place. Some degree of essentialization is inescapable and desirable (Spivak, 1993; Sayer, 1997) in order to promote and advocate causes whose analysis may be dependent upon social constructionism. For instance, causes such as mother-tongues education, minority language, language rights, multilingualism, and so forth are dependent on social constructionism and often involve essentialization.

The question that arises, however, is whether reification to the degree of treating languages as discrete serves the objectives which the analysis is meant to serve. It is for this reason that postcolonial CAL questions the “thingness” of language or the anthropolinguistic perspective reified in order to capture the dynamics of social and linguistic variation. The anti-anthropolinguistic stance has been taken further by work which questions the conceptual validity of multilingualism as an alternative to monolingualism. Multilingualism, postcolonial CAL scholars argue, is caught up in the same paradigm as monolingualism

in that it is a form of plural monolingualism. As an alternative to multilingualism, they advance concepts such as polylingualism, metro-lingualism, and *vague linguistique* (Makoni & Makoni, 2009), all of which reflect an indeterminate, fluid, and constantly evolving singularity which these scholars view as a return to monolingualism; not, however, linguistic monolingualism but rather humanistic monolingualism. Linguistic monolingualism refers to language as a code, as a system, and with no reference made to the language user. In humanistic monolingualism the emphasis is on the way an individual is able to integrate personal experiences with social biography as a critical component of an individual's language. Nonetheless, CAL is heterogeneous. It encompasses a number of areas such as migration studies, feminist research, critical pedagogy, and so forth. The subareas differ considerably in their method, mode of analysis, and orientation toward language, multilingualism, and other language-based frameworks. They also differ in how they are situated within the debate on essentialization and constructivism.

Postcolonial CAL, however, tends to situate itself at the intersection of essentialization and social constructionism because it is at the point of intersection between the two that social realism can be effectively described. In the promotion of social causes CAL essentializes to advance its political causes. Yet both approaches, social constructionist and essentialist, engage with political critique of social relations and promote variants of applied linguistics situated in social and cultural traditions outside Western contexts. These variants focus on questions that deal with applied linguistic concepts drawn from Asia, India, and Latin America (Shi-Xu, 2009). For example, the conventional tendency is to describe New Englishes using a metalanguage with origins in Latin. Yet in a postcolonial framework the analysis is recontextualized by describing English using metalanguage from other regions of the world. English is thus described and viewed through the lens of Indian, Latin American, and African metadiscursive regimes.

The contribution of non-Western contexts in mainstream applied linguistics is not new. For instance, the work by Gumperz (1958), which began in India, and systemic functional linguistics (SFL), which was stimulated in part by Halliday's learning of Chinese and reading of Chinese grammars, were subsequently to have a considerable impact on applied linguistics (Shi-Xu, 2009). The roots of these theoretical frameworks were outside the Western world. Nonetheless, the Chinese origins of SFL are rarely acknowledged. The tendency is to trace the origins of this work to Malinowski, Firth, and so forth. Similarly, the work of some eminent applied linguists such as Brumfit, Davies, and many others was shaped initially by their experiences in African countries such as Tanzania, Kenya, and Zimbabwe. CAL, in this regard, is situated at the intersection of colonialism, postcolonialism, feminist theories, and history.

Given the literature on colonialism and language practices in Asia, Latin America, and Africa, CAL, therefore, has a longer trajectory in these regions and may be as old as colonialism. After all, the appropriation of languages is a feature of colonialism (Fabian, 1991). The appropriation was carried out through descriptions of grammars, dictionaries, and word lists. At this stage, the distinction between description and prescription was blurred because description was used prescriptively.

Research in critical history has implications for CAL; findings in one field have implications for another. Critical historians, for instance, argue that colonial regimes were neither monolithic nor omnipotent. These historians further point out that closer investigation reveals "competing agendas for using power, competing strategies for maintaining control, and doubts about the legitimacy of the venture" (Cooper & Stoler, 1997, p. 6). The point critical historians make is that the strength of colonialism is exaggerated. Colonialism, they assert, is much weaker than previously thought. If critical historians are correct, it seems that from a language planning perspective, colonial language policy exists more in abstract theory than in practice. In terms of practice, colonial policies were a bricolage, with imperial

powers modeling their practices at times on non-European colonial powers. Hence "France turned to Russia and Russia to the American west" (Stoler & McGranahan, 2007, p. 4) and at times even the supposed intuitive distinction between colonizer and colonized was not clear. This is reflected in the relationship between Egypt and the Sudan, where Egypt is a "colonized colonizer." The tendency in CAL scholarship, however, has been to interpret the abstract as real.

Colonial language policies are important in the writings of CAL (Pennycook, 2004; Ramanathan, 2005) because they bring to the fore politics and reflect how local power structures conform to and confound pressures brought by globalization. As critical historians point out, however, colonial policies including language policies were a bricolage, and it is therefore not surprising that colonial languages refer to a range of referents: missionary variants of African languages (Meeuwis, 2009), products of processes of Arabization, and the imposition of English. This is to be expected because what constitutes colonial and what a "colonist" is differ between languages and also vary in terms of both historical and geographical space. In Africa, for instance, historically standardized African languages were framed as colonial or "European" languages by African elites (Errington, 2007). Yet in Africa the same languages are now a rallying point in indigenous language advocacy campaigns. Similarly, Arabic was treated as a threat by the British but not by the southern Sudanese who appropriated it. In Sudan, African languages and English are treated as languages of resistance against Arabization. In CAL grammars are political, and this has been effectively demonstrated by the publication of a Pan-Hispanic grammar (Valle, 2009). The Pan-Hispanic grammar is based on all the varieties of Spanish, which explains the use of the term "Total Spanish" approved by all Spanish language academies. A Pan-Hispanic grammar is a symbol of the emergence of a Spanish cross-continental unity of equals. The equality is evident in the erasure of the dominant status of scholars from Spain. In fact, "the conspicuous erasure of the leadership role played by the Spanish linguist and his team further reveals the strategic value of wrapping the grammar in an image of authority and pan-Hispanic consensus" (Valle, 2009, p. 883).

CAL is as much an intellectual project as it is a call to political action, deploying many modes rendering the "process of decision-making transparent for the wider public" (Wodak, 2006, p. 299). Most of what is visible to the public is a "staging" of politics because the state is vulnerable when its decision-making processes are known and it is treated as embedded in society and not reified. In fact, the state contributes toward the construction of reality. This it accomplishes through its financing of language education, language teaching, lexicography, and language planning. The state, however, is a key player in knowledge production. Interestingly, applied linguistics is one of the disciplines involved in state interventions in language, which suggests that, to a large degree, applied linguistics is a state subject. The desire to influence the "real world" may, however, be perceived as outside applied linguistics. Yet politics is part of CAL, as reflected in its grappling with colonialism and globalization.

Even though the state has the power to produce knowledge, authorized knowledge is resisted, as reflected in critical discourse analysis (CDA). CDA resists the effects of power when it illuminates covert ideologies in texts, thereby liberating society while inadvertently reinforcing the subordinate status of others. When CDA illuminates ideologies underlying the production of most texts it is itself reflecting its own ideologies. Analysis in CDA is therefore always continuous. However, unlike other areas of CAL, CDA does not have identifiable methods, but this renders it highly adaptable to different contexts, particularly fluid, multilingual ones. Until recently, CDA has depended on the discourse analyst for the interpretation of texts, ironically reinforcing the monopolization of knowledge production by a few actors. To preempt a monopoly of knowledge, ethnographical accounts of the readings of texts are used to complement the analysts' interpretation.

In the past most of the texts were from Euro-American contexts, but there is an increasing number from other parts of the world. If texts are drawn from different parts of the world then some will inevitably be bilingual, thus rectifying the monolingual Anglo-centered nature of texts frequently used in CDA. For CDA to be relevant to other regions of the world it has to develop a strong sense of history because some trends which are not evident when viewed synchronically are self-evident diachronically. When situated in other contexts, it has to draw on other intellectual traditions.

Another process which has been a source of controversy in CAL is globalization. One of the most powerful but controversial arguments posited by Phillipson (1992) and others is the impact of the colonial on the periphery. The argument is replete with irony which is often disconcerting to “third world” scholars. For instance, the idea of “linguistic imperialism” is now more or less universally associated with scholars from the “center.” It gives insight into knowledge production and dissemination which are, again, associated with the center rather than the periphery. “Periphery” refers to former European colonies. A more convincing analysis has to be historical, geographical, and ethno-class situated, thus creating opportunities to discuss the effects of globalization, the impact of globalization, and how it shaped center countries themselves, through the spread of “third world” languages and cultures. The effect of globalization has compelled us to be more reflexive as we grapple with issues about ethics and the potentially acrimonious discussion of the degree to which we can be held morally responsible individually and collectively for the uses to which our research is put.

Because CAL has a global reach and because of its social constructionist orientations, it has to address dichotomies in applied linguistics such as gender, the native speaker (Kabel, 2009), and so forth. Gender is incompatible with sociolinguistic realities in some post-colonial contexts, especially in Africa. Oyewumi (1997), for example, argues that the Yoruba (in Nigeria) are not organized along gender lines. To this end, analytical categories such as male-wife or female-husband exist although these do not have direct correspondence with male/female distinctions based on the Western concept of a nuclear family. The male/female divide is not based on biology but rather relates to the cultural roles played by individuals. Similarly, concepts such as native speaker, identity, community, and language are all founded on Western monolingual communities. These concepts are not robust enough to explain the complex linguistic tapestry of multilingual communities.

The discourse of monoglot normality has influenced applied linguistics in many ways. Languages such as creoles in multilingual settings are treated as “exceptional” or something of an oddity. Multilingualism renders the discourse of “normality” problematic. Because the relationship between language and identity tends to be treated as a monolingual affair, language practices in multilingual communities may misrepresent it unless it is handled carefully. For instance, language shift is equated to language loss, notwithstanding the fact that a multilingual individual’s identity is located in multiple codes. Similarly, in monoglot views, the “native speaker” is a valuable asset, but in multilingual communities it is not clear how “nativeness is assigned” (Love, 2009, p. 31). In addition, distinctions between monolingualism and multilingualism are based on individual linguistic resources. Since linguistic resources vary between individuals the idiolect inevitably becomes one of the central pillars in CAL. An idiolect is then viewed as a set of an individual’s linguistic resources or form–meaning connections. People coordinate idiolects in discourse, and they generalize them to other resources called languages, dialects, registers, styles, and so forth.

Another area of research which is of central significance to CAL is migration studies. Migration has become salient in national discourses because of xenophobia. Xenophobia and the ever-changing immigration rules make immigrants from the south vulnerable to discrimination. Through discourse analysis CAL challenges such discrimination, because

discrimination is a social process embedded in discourse and can thus be challenged through discourse analysis.

In critical pedagogy, which is one of the strands of CAL, the objective is to encourage self-reflexivity by language teachers. Language teaching is here seen as a powerful political tool with social consequences, which has become important in a post 9/11 world in which issues about security have acquired a linguistic turn. In critical pedagogy, there is also awareness that there might be differences across contexts in terms of what are construed as acceptable learning and teaching styles. For example, whereas rote learning is denigrated in Western language learning, Ramanathan (2005) shows that rote learning and choral responses occur in many contexts in India. In some situations critical pedagogy examines the complicated relationships between language teaching and proselytization.

Closely related to critical pedagogy is language testing. Whereas in the past the tendency was to construe language testing as positivist, language testers need to develop an awareness of the power of tests as they shape learners' life outcomes. Critical language testing also raises the role of ethics in testing (Shohamy, 1997).

Conclusion

Love (2009, p. 31) states that "what passes for a study of science is a form of culture maintenance." Throughout this entry we have shown how the claim of the culture of maintenance can be addressed. We have shown the relevance of texts from other languages, the need to use metalanguages from other traditions of linguistic thought, the need for sensitivity to concepts which are underpinned by the assumptions of monoglot communities, and how these factors make it difficult to argue that Western concepts of language are necessarily applicable to postcolonial contexts. The development and writing of grammars in the nineteenth century and, more recently, the publication of the Pan-Hispanic grammar reflect the extent to which grammars are political artifacts and that languages are neither natural nor primordial, similarly to ethnicities, notwithstanding the fact that, subjectively, languages may be perceived as natural.

CAL shares common features with social constructionist versions of other disciplines such as geography, history, and so forth in their critique of the natural and their emphasis on human-centeredness. CAL, even though it might have features which are peculiar to it, is closely aligned with applied linguistics. It also contributes toward an understanding of language planning through its reevaluation of accepted categories in applied linguistics and the connections it makes between the state and language.

Critical Discourse Analysis

BERNHARD FORCHTNER

Critical discourse analysis (CDA, nowadays also referred to as critical discourse studies) investigates naturally occurring written and spoken language beyond the sentence level, as well as other forms of meaning making, such as visuals and sounds, seeing them as irreducible elements in the (re)production of society. However, *critical* discourse analysis furthermore aims to demystify the role language plays in the (re)production of unjustified domination and inequality, and questions the social conditions in which these discourses are embedded. This has made CDA an increasingly popular, and still evolving, approach over the last two decades. This entry offers an introductory overview of the core principle, diverging strands, and controversies in the field.

Starting Points: Discourse and Critical Impetus

CDA, as a label and network of scholars, emerged in the early 1990s in the course of interdisciplinary attempts to apply linguistic insights to the analysis and theorizing of social phenomena. Due to different contexts of emergence and the problems faced, CDA cannot be seen as a homogeneous theory but rather as a heterogeneous perspective informed by a variety of positions in such diverse fields as pragmatics, rhetoric, sociolinguistics, sociology, philosophy, social psychology, and text linguistics. Despite its pluralism, at least two widely shared concepts, discourse and critique, can be considered to constitute the core of CDA.

First, the concept of discourse is often used multidimensionally, ranging from style (e.g., “the discourse of academics”) and genre-related understandings (e.g., “the discourse of editorials”) to communication on a particular topic (e.g., “the discourse on racism”) or even as producing the respective object, that is, as a network of knowledge. Nevertheless, a common denominator can be identified in, for example, Fairclough and Wodak’s (1997, p. 258) characterization of discourse as “a form of ‘social practice’”. Describing discourse as a social practice implies a dialectical relationship between a particular discursive event and the situation(s), institution(s) and social structure(s), which frame it . . . To put the same point in a different way, discourse is socially *constitutive* as well as socially shaped.” As such, discourse is understood as the social activity of making meaning through language use or semiosis, that is, meaning making not only through written and spoken language but also via sound, gestures, and images. Simultaneously, discourse is viewed as a crucial element in the (re)production of the social relations of a given society. However, discourses are not seen as free-floating or singular elements in this (re)production but as embedded in social contexts, referring to each other (interdiscursivity) as well as to material conditions which enable/constrain discourses.

Second, CDA is not interested in discourses for their own sake but seeks to challenge the linguistic/semiotic relations through which injustice is obscured and (re)produced. Hence, CDA claims to be critical when investigating semiosis in contrast to more descriptive forms of discourse analysis. Fairclough (2010, p. 43), for example, rejects approaches which “describe without explaining” or explain while just taking the immediate micro-context of the situation into account. Here, CDA echoes Horkheimer’s (1972, pp. 206–7)

demarcation of critical and traditional research. While the latter tends to perceive the world as a sum-total of facts and does not question its genesis, the former “has society itself for its object . . . [and] is suspicious of the very categories of better, useful, appropriate, productive, and valuable, as these are understood in the present order.” CDA too aims to denaturalize ideological categories which help to (re)produce unjustified power structures and thereby provides resources for those struggling against linguistic/semiotic aspects of injustice. Moreover, its proponents put forward a transformative agenda “for emancipation, self-determination and social recognition . . . [which] is motivated by the perhaps utopian conviction that unsatisfactory social conditions can, and therefore must, be subject to methodological transformation towards fewer social dysfunctional and unjustifiable inequalities” (Reisigl & Wodak, 2001, p. 34). CDA’s critique is thus negative, that is, denaturalizing and demystifying, and positive, that is, providing more inclusive and egalitarian solutions (Fairclough, 2010, p. 14).

Further Crucial Concepts

Closely related to the notion of discourse are concepts like text, intertextuality, genre, and recontextualization. These concepts carry roughly similar meanings across the various approaches in CDA.

For example, Lemke (1995, p. 7) describes the relation between discourses and texts as follows: “[o]n each occasion when the particular meanings characteristic of these discourses are being made, a specific *text* is produced. Discourses, as social actions more or less governed by social habits, produce texts that will in some ways be alike in their meanings.” However, by the very nature of being part of a discourse, texts are also, to varying degrees, “sites of struggles,” as they are rarely absolutely coherent entities but are informed by a range of positions (Wodak & Meyer, 2009, p. 10). This heterogeneity, that is, intertextuality, is established through explicit and/or implicit, synchronic and/or diachronic relations to various other texts and is thus a “source of much of the ambivalence of texts” (Fairclough, 1992, p. 105). At the same time, texts are always situated and, as such, part of distinct genres. A widely accepted definition is given by Fairclough (1992, p. 126), who characterizes genre as a “relatively stable set of conventions that is associated with, and partly enacts, a socially ratified type of activity.” In other words, particular discursive practices, as other social activities, follow particular sets of rules which are crucial factors in meaning making. Finally, recontextualizing describes the process of decontextualizing a given text element and transferring it to another one, by which means a (partly) new meaning is created (Reisigl & Wodak, 2009, p. 90). In addition, Chouliaraki and Fairclough (1999, pp. 93–4) point out the role of recontextualization in struggles due to the emancipatory or regressive consequences that the transfer of an argument into new contexts can have.

These concepts can be illustrated by reference to “God Save the Queen,” an (in)famous song by the punk rock band the Sex Pistols, released during Queen Elizabeth II’s Silver Jubilee in 1977. This multimodal text combines lyrics with various kinds of sounds and belongs to the genre of “song,” more specifically “punk rock song,” which follows a particular set of conventions and thus raises expectations in those familiar with the genre. The song is, furthermore, part of a wider discourse on the role of the monarchy in the United Kingdom and thus several interdiscursive relations exist, for example, to the discourse on what constitutes “Britishness.” For many listeners, its meanings derive, for instance, from an explicit intertextual reference to the similarly entitled national anthem of the United Kingdom: By decontextualizing phrases from the anthem and recontextualizing them in their song, the band sparked a scandal when it released the song. Related to this example, CDA might raise questions such as “What does this text tell us about the

UK and its inner constitution?" "What was specific about the 1970s that made this song relatively iconic?" "Why did this particular genre emerge?" "Does this text challenge unjustified power structures?" and "How does the text realize its aims linguistically, for instance, who appears as an agent, which metaphors are used, etc.?" This example furthermore indicates the range of text genres that can be analyzed: from punk rock songs to television programs, from cigarette packets to blogs, from political speeches to newspaper articles, and so forth.

Varieties of CDA

CDA has never aimed to establish a coherent body of concepts and definitions. Apart from some shared core assumptions (see above), differences continue to exist. Given the plurality of approaches within CDA, and the limited space available here, the following can only touch briefly on what are arguably the three most influential approaches in CDA: Norman Fairclough's dialectical-relational approach, Teun van Dijk's sociocognitive approach, and Ruth Wodak's discourse-historical approach. This section will address their predominant research interests, their particular conceptual frames, and, where appropriate, their epistemological foundation. However, several other approaches exist within CDA, such as critical metaphor analysis (e.g., Charteris-Black, 2004), the so-called Duisburg group which draws extensively on Foucauldian concepts (Jäger & Maier, 2009), and van Leeuwen's (2004) theory of discourse as recontextualizing social practice.

Fairclough's Dialectical-Relational Approach

Fairclough's program focuses on discourse in relation to social/cultural change, in particular the emergence of new forms of capitalism. Here, semiosis is viewed as central: Social/cultural changes are no longer pushed through simply by means of coercion, but also through discourse (Chouliaraki & Fairclough, 1999). In other words, discursive change and social change go hand in hand.

These changes occur not only within the textual dimension of discourse, but also in what Fairclough (1992, pp. 96–9, 200–24; 2010, pp. 232–3)—building on Foucault—calls "orders of discourse." The latter are relatively stable "ordering[s] of relationships among different ways of making meaning, i.e. different discourses" (Fairclough, 2010, p. 265). For example, the discourse on property nowadays is characterized by the dominance of a discourse of private property over other property regimes. However, instead of simply investigating the textual dimension of discourses, Fairclough (2010, pp. 132–3) proposes to analyze three dimensions of discourse simultaneously.

- Texts should be described.
- The relationship between these texts and discursive processes should be interpreted.
- The relationship between discursive processes and wider social processes should be explained.

Analyzing the interplay between abstract structures, concrete events, and mediating practices of, for example, the existing property regime must consequently also address the dialectical relationship between linguistic/semiotic and other elements within each element of the social process (Fairclough, 2010, p. 232). The dialectical-relational approach is therefore

- relational insofar as it deals with relations between discourses (and nondiscursive elements) which themselves consist of relations, and

4 CRITICAL DISCOURSE ANALYSIS

- dialectical as it focuses on the mutual relationships between, for example, the discursive and the material.

Among the three core approaches to CDA, the dialectical-relational approach is most systematically influenced by critical linguistics (e.g., Fowler, 1996) and draws on the linguistic theory of systemic functional linguistics (Chouliaraki & Fairclough, 1999, pp. 139–55). At the same time, Fairclough and his collaborators have related CDA explicitly and systematically to social theories such as those of Anthony Giddens, Antonio Gramsci, Chantal Mouffe, Ernesto Laclau, Jürgen Habermas, Karl Marx, Louis Althusser, Michel Foucault, and Pierre Bourdieu (e.g., Chouliaraki & Fairclough, 1999).

Van Dijk's Sociocognitive Approach

Van Dijk's work (e.g., 1993) has been concerned with the analysis of racism for many years, the role of elites in the (re)production of ethnic prejudice, and, thus, unjustified power relations.

However, van Dijk has pursued his research interests through very specific means. He has continuously argued for the inclusion of cognitive elements in the theoretical framework of CDA—what he describes as a sociocognitive approach. In short, van Dijk is interested in cognitive structures and the way in which these structures, in every instance and on every level, serve as an interface between social activities (discourse) and the properties surrounding social situations. This mediation is accomplished by subjective mental models which are activated through contact with the respective text and, subsequently, determine its interpretation (van Dijk, 1998, pp. 78–89; 2008, pp. 57–70). This proposal has far-reaching consequences for CDA as, for example, the understanding of context shows. Both the dialectical-relational and the discourse-historical approach tend to understand context as rather objective, enabling, and construing meaningful social activity, that is, framing discourses through objectively existing (though alterable) properties (however, at least in the case of the discourse-historical approach, this builds on the concept of mental models; see Wodak et al., 1990, pp. 37–9). Van Dijk (2008, p. 71) defines context as “*a special kind of mental model of everyday experience*,” that is, in subjective-cognitive and not objective-external terms. It is only through such contextual models that people are able to interpret their social environment and (re)act.

According to van Dijk (2008, p. 73), it is through analysis of such context models that researchers “can describe as well as explain how our discourses are (produced as) situationally appropriate.” A telling example of the significance of the cognitive aspect in van Dijk's work is his conceptualization of ideology. While both the dialectical-relational and the discourse-historical approaches understand ideology roughly in terms of a mystified, particularistic representation of social relations, van Dijk (1998, p. 8) proposes a neutral definition of ideologies, seeing them as simply being the “*basis of the social representations shared by a group*.” It is the study of this socially shared representation—the interface between the social and the individual—which enables an understanding of social practices, that is, discourses (van Dijk, 1998, pp. 88–9).

Wodak's Discourse-Historical Approach

The discourse-historical approach cannot be understood without some awareness of the eruption of anti-Semitic and nationalist discourses in Austria at the end of the 1980s (e.g., Wodak et al., 1990). Similar to van Dijk's research, this tradition has focused extensively on anti-Semitism, racism, nationalism, and xenophobia (e.g., Reisigl & Wodak, 2001; Heer, Manoschek, Pollak, & Wodak, 2008; Wodak, de Cillia, Reisigl, & Liebhart, 2009). However, since 2000, Wodak and her collaborators have also studied other areas, among them

decision-making processes in European Union organizations (e.g., Muntigl et al., 2000). Central to all these studies is the conviction that understanding discursive events implies taking their broader sociopolitical and historical contexts into account. Consequently, a four-dimensional concept of context is at the center of this approach. It includes

- immediate language or text-internal co-text,
- intertextual and interdiscursive relationships,
- the specific context of the situation in which the discursive practice takes place, and
- the broader sociopolitical and historical context (Reisigl & Wodak, 2001, p. 41).

Discursive strategies, which are crucial in the construction of positive self and negative other representations, are a further tool of analysis within the discourse-historical approach. These more or less intentional strategies are concerned with nomination ("How are persons, objects, phenomena, etc. linguistically referred to?"), predication ("With what characteristics are they credited?"), argumentation ("How is this characterization justified?"), perspectivation ("From what perspective are these processes conducted?"), and intensification/mitigation ("Are strategies used which intensify/mitigate the overall force of the respective argument?") (Reisigl & Wodak, 2001, pp. 44–5; 2009, pp. 93–4; Wodak et al., 2009, pp. 31–5). Ideally, such analyses triangulate multiple methods and genres such as interview and focus-group transcripts, political speeches, and so forth (e.g., Wodak et al., 2009). Another distinct characteristic of the discourse-historical approach is its differentiation of critique as immanent critique (problematizing text/discourse internal inconsistencies), socio-diagnostic critique (denaturalizing particular discursive practices), and sociodiagnostic/retrospective critique (aiming for transformation of the current state of affairs) (Reisigl & Wodak, 2001, pp. 32–5).

Despite drawing on a variety of social theorists in general, the discourse-historical approach specifically refers to the Frankfurt School, in particular the critical theory of Habermas (Reisigl & Wodak, 2001, pp. 32–4, 263–71; Forchtner, 2011), and it is mainly the latter's language philosophy which validates the discourse-historical approach's critical position.

Criticisms of CDA

Since its emergence, CDA has repeatedly provoked heated debates, initiated by scholars from within the approach as well as from external critics. Two strands of criticism seem to be of particular importance for the further development of CDA.

First, a number of critics have characterized CDA as lacking systemic analysis and being politically biased (Stubbs, 1997; Widdowson, 2004). Concerning the apparent lack of rigor in its analysis, this can be—and has been—dealt with by systematic procedures of data selection and data downsizing, as well as the incorporation of quantitative methods, such as corpus linguistic tools. Concerning the criticism of CDA as producing politically biased research, it has been made explicit many times that CDA takes a stance against unjustified domination and inequality and its causes. However, this has been done in transparent and verifiable ways. Given CDA's aim of translating its critical insights into political action, that is, real improvements for those in need, methodical rigor, transparency, and verifiability are in CDA's own interest.

Second, concerning CDA's own critical standards, one of its eminent researchers, Michael Billig (2003), points to the potentially problematic consequences of constructing another's research (implicitly) as not being critical by providing nothing more than "rhetoric of critique." Billig has sparked further debate on the issue of the "language of critical discourse analysis" in a recent intervention regarding CDA's own writing style and extensive use

of nominalizations and passivizations, which critical discourse analysts usually criticize in their own research (Billig, 2008, pp. 783–844).

The subject of critique itself is indeed a pressing concern in CDA as its critical attitude toward discourses which (re)produce unjustified domination and inequality is not always theoretically justified. The question is whether such a justification of CDA's principles is needed or whether the conventions of this particular research community provide sufficient foundation. The degree to which CDA is able to clarify this question and integrate social theories in order to form even more coherent proposals, which (a) acknowledge the importance of discourse in the (re)production of the social, (b) provide concepts to understand and explain it critically, and (c) are able to coherently validate its own critical standards, might prove crucial for the further development of CDA.

Conclusions

CDA provides a normative framework for social research, by which means social problems and/or wrongs can be addressed by providing a space for dialogue between relevant disciplines. Central to such a critical social science remains the focus on the systematic analysis of discourses (written, spoken, visual, audible) in relation to the sociopolitical context. As such, integrating detailed textual analysis with theories and concepts taken from anthropology, philosophy, sociology, and other disciplines will remain the main task for critical discourse analysts in years to come.

Critical Discourse Analysis and Critical Applied Linguistics

AHMAR MAHBOOB AND BRIAN PALTRIDGE

What Is Critical Applied Linguistics?

Critical applied linguistics studies ways in which education, regulation, and the study and use of language relate to the realization, maintenance, and reproduction of the distribution of power in society. The critical move in applied linguistics focuses on issues of power as it is enacted, reproduced, and resisted through fields associated with language studies, such as language policy and planning, language codification, language teaching, language learning, and language testing. The purpose of this work is not only to understand and explain how power is constructed and exercised through language, but also to change the practices and empower those who are at risk from oppressive practices. Work that attempts to achieve these goals in applied linguistics has a “critical” perspective, even if it is not always labeled as such (Pennycook, 2010). Some of this critically oriented work predates the adoption of the term “critical” in applied linguistics, while others followed in response to a call by Pennycook in his 1990 article “Towards a Critical Applied Linguistics for the 1990s”:

We need to not only understand ourselves as intellectuals situated in very particular social, cultural and historical locations, but also to understand that the knowledge we produce is always interested. If we are concerned about the manifold and manifest inequities of the societies and the world we live in, then I believe we must start to take up moral and political projects to change those circumstances . . . [We would] do well to be more humble in the world, listening to the many alternative views of language and learning, rather than preaching our views as the newest and best. (Pennycook, 1990, pp. 25–6)

“Critical” in Language Policies

Studies in language policy focus on the regulations, laws, policies, and practices that relate to the use and functional distribution of languages. These studies examine issues such as which language(s) are adopted as national or official languages or both in a region; and the status, role, and future of languages that are not promoted through such regulatory policies. It investigates how and why certain languages are given a privileged position, and how the use of particular language(s) helps the powerful maintain their political and economic control.

Tollefson points out that the term “critical” has three interrelated meanings:

(1) it refers to work that is critical of traditional, mainstream approaches to language policy research; (2) it includes research that is aimed at social change; and (3) it refers to research that is influenced by critical theory. (Tollefson, 2006, p. 42)

One key influence of critical language policy studies has been in examining the role, function, and power of English worldwide. In examining English as a global language, Phillipson argues that English, as it is used as a worldwide language, privileges countries where English is spoken as a native language and positions people who can use the language proficiently in a more powerful position vis-à-vis the local population who cannot. He writes:

whereas once Britannia ruled the waves, now it is English which rules them. The British Empire has given way to the empire of English. [Critical applied linguistics] attempts to contribute to an understanding of the ways in which English rules, who makes the rules, and what role the English teaching profession plays in promoting the “rules” of English and the rule of English. (Phillipson, 1992, p. 1)

Phillipson's (1992) *Linguistic Imperialism* was one of the first book-length studies of how English plays a crucial role in the maintenance of power structures in a postcolonial context. However, this work has also been quite controversial. For example, Canagarajah (1999) in his book *Resisting Linguistic Imperialism* critiques Phillipson by highlighting the deterministic nature of Phillipson's work. He also notes that Phillipson's work has been done from the “centre” and does not provide the tools to explore the complexities of resistance to linguistic domination. Pennycook (2001) similarly raises concerns about these arguments and notes that “Phillipson takes a static view of language and maps it onto a deterministic political framework, suggesting thereby that the promotion of English supports dominant capitalistic and political interests” (p. 62). While both Canagarajah and Pennycook note the power of English, they also highlight the importance of studying how English is appropriated and resisted by people in different parts of the world.

Critical language policy research also seeks to describe and explain how people in various parts of the world have internalized the notion that English is the language of national development. As a result of this belief they maintain and promote English as a national or an official language, often at the cost of local languages. For example, Mahboob (2002) examines how the language policies in Pakistan devalue local language and encourage the adoption and use of English. Such ideologies, rather than leading to national development, naturalize the power of English and ensure that the existing power relationships are maintained. As such, they can be seen as hegemonic practice.

Critical work on language policy also examines claims about how English and other languages relate to national and economic development. English is often linked to processes of modernization and development and is marketed as the language of diplomacy, education, finance, globalization, science, technology, tourism, and so forth. As a consequence of this, there is a global trend for English to be introduced in all schools and at earlier grades. Critical inquiries into the question of “earlier is better” English-in-education policies question whether such policies work. They observe that students who are educated through such reforms show no marked differences from students who are educated in their local languages. In fact, some studies show that such policies give “people an inadequate education both of and through their first language” (Pennycook, 1999, p. 1). Pennycook (1999) also points out that putting the limited resources of developing countries into English takes away resources that could be spent on educating female students or other marginalized groups, or on other developmental projects. Thus, the relationship between English and development is seen as tenuous at best.

“Critical” in Language Codification

Language codification processes are those in which linguists study and document how languages work. Typically, research on language documentation and codification is not labeled “critical.” However, this work can be seen as critical in how it influences people’s perceptions and beliefs about language and how language works in society. These descriptions of language are used in education and inform the design of pedagogical and other material. For example, traditional grammars of English, used and taught through textbooks, are based on these materials. These codified varieties are normalized through their use in education and promoted as the “standard” language. Critical perspectives on this work raise questions such as: Whose dialect is codified and used as models in education? How are variations on the “standard” evaluated or judged? And what consequences do people face when they do not adhere to the standard language? Such questions have been raised in work on World Englishes (Kachru, 1990) and creole studies (Nero, 2006) and have influenced and contributed to the critical stance in linguistics and applied linguistics.

The work in areas such as World Englishes and critical language policy (Phillipson, 1992) has created space for other movements in applied linguistics as well. One example of this is the non-native English speakers in TESOL (NNEST) movement. NNESTs have, for a considerable amount of time, outnumbered native English speakers in TESOL (NESTs); however, they have been marginalized in the profession (Mahboob, 2010). The best jobs (with higher salaries and better benefits) are often given to NESTs, even if NNESTs have appropriate credentials for the position. Experts studying this issue have raised awareness about the inequities in the job market working against qualified NNESTs. Another thread of research that builds on these issues focuses on race in the context of applied linguistics and TESOL. This work also has an emancipatory agenda and is clearly critical in its orientation, even if it is not always labeled as such.

“Critical” Language Teaching

Pennycook (1989) argues that language teaching approaches are not neutral, but rather reflect “a particular view of the world and [are] articulated in the interests of unequal power relationships” (pp. 589–90). This position has been affirmed by researchers who have shown how particular teaching methods developed in North America, Britain, and Australia (NABA) and marketed worldwide are not necessarily appropriate for their contexts. For example, Chick (1996) argues that the use of the communicative approach in language teaching “was possibly a sort of naive ethnocentrism prompted by the thought that what is good for Europe or the USA had to be good for KwaZulu” (p. 22). Similar issues were raised by researchers in China, India, Japan, Pakistan, South Korea, and Thailand.

A critical turn in language teaching posits that language teaching is not only about methods but about teachers’ ability “to operate with some personal conceptualization of how their teaching leads to desired learning—with a notion of causation that has a measure of credibility for them” (Prabhu, 1990, p. 172). As such, “critical” language teaching is much more interested in helping students achieve the goals that are important to them and less in the “method” used to do this. Kumaravadivelu (2006) calls this the “post-method condition,” and in response to it presents an alternative framework and introduces three operating principles that need to be considered in language teaching: particularity, practicality, and possibility.

Particularity seeks to facilitate the advancement of a context-sensitive, location-specific pedagogy that is based on a true understanding of local linguistic, social, cultural, and political particularities. Practicality seeks to rupture the reified role relationship between theorizers and practitioners by enabling and encouraging teachers to theorize from their practice and to practice what they theorize. Possibility seeks to tap the sociopolitical consciousness that students bring with them to the classroom so that it can also function as a catalyst for identity formation and social transformation. (Kumaravadivelu, 2006, p. 69)

Other researchers engaged in critical language teaching have also recognized these principles in their work. For example, Canagarajah (1999) provides an in-depth study of how teachers and students working in remote Sri Lankan classes use creative classroom strategies that reflect an engagement with local context, needs, and resources. He, along with other critical applied linguists (e.g., Norton Peirce, 1995), highlights the importance of identity in the discussions of language teaching (and learning). He argues that what we need is an approach that

provides for the possibility that, in everyday life, the powerless in post-colonial communities may find ways to negotiate, alter, and oppose political structures, and reconstruct their languages, cultures, and identities to their advantage. The intention is not to reject English, but to reconstitute it in more inclusive, ethical, and democratic terms. (Canagarajah, 1999, p. 2)

Genre pedagogues in Australia (Martin & Rose, 2008) have taken a different approach to empowering students from disadvantaged communities. Genre pedagogues argue that in order to help students from disadvantaged backgrounds to move out of their positions of marginalization, they need to be explicitly taught the language and discourses of power. These authors point out that the skills required to produce written texts—the genres of power and access—are not equally available to students from minority or marginalized groups. The aim of genre pedagogy is therefore to help students develop control of these genres. In order to do this, genre pedagogues draw on work on systemic functional linguistics, the sociology of education, and sociocultural theory.

“Critical” Language Learning

The critical turn in language-learning research examines questions such as “How do power relations affect language learning, and how do they affect the social identities, wishes, desires, and histories of language learners?” (Ellis & Barkhuizen, 2005, p. 281). In order to do this, Ellis and Barkhuizen add:

Theorists and researchers would unavoidably have to look beyond the walls of language classrooms and other language learning settings and events, beyond the bounds of static social relationships and unidimensional language learners, and beyond commonly accepted and unquestioned causal variables such as personality traits (introversion or extroversion, for instance) and motivational factors (for example, the influence of instrumental and integrative motivation). (2005, pp. 282–3)

One of the first researchers who explored this in the context of TESOL was Norton (Norton Peirce, 1995). She, among others, argues that identity needs to be understood as fluid, dynamic, and multiple, rather than as constant or static. Identity is something that is

negotiated through language and changes based on the learners' needs, resources, and context. She writes:

It is through language that a person negotiates a sense of self within and across different sites at different points in time, and it is through language that a person gains access to—or is denied access to—powerful social networks that give learners the opportunity to speak. (Norton, 2000, p. 5)

Norton also writes that learning a language is like making an investment. When learners invest in learning a new language, "they do so with the understanding that they will acquire a wider range of symbolic and material resources, which will in turn increase the value of their cultural capital" (Norton, 2000, p. 10). The use of economic metaphors in Norton's work posits that language learning is not simply a result of "instrumental" or "integrative" motivation, but something that the learners expect to gain from.

"Critical" Language Testing

Shohamy's (2001) book *The Power of Tests* represents an important turn in language testing, from a focus on issues such as measurement and validation to ethical issues such as what tests are doing, how they affect people's lives, and how they should be used responsibly. Hamp-Lyons (2000, p. 579) discusses "the accountability *to* society and *by* society that should drive all those involved in the industry of creating, administering, consuming, preparing people for, and critiquing tests" (original emphasis). McNamara and Shohamy (2008) continue this discussion in relation to the use of language tests for citizenship, immigration, and asylum purposes. This work mirrors the key tenet of critical applied linguistics research, which aims not just to describe what people are doing, but also to transform and change what they do (Pennycook, 2001). McNamara (2009) points out the discriminatory policies and practices that the use of such tests support. He discusses how the 1901–73 White Australia Policy, up to the 1930s, employed English dictation tests as a way of keeping people out of Australia. The new Australian Citizenship Test now plays a similar role. McNamara points out, however, that the language requirements of this test are, in fact, much higher than previous standards set for this purpose and that test takers need to obtain a high level of language and literacy skills in order to have a chance of passing the test. This, of course, is not just happening in Australia. Language and other sorts of tests are being used for similar gatekeeping purposes in the Netherlands, Sweden, Denmark, France, Germany, Estonia, Latvia, the UK, and the US (McNamara & Shohamy, 2008). Language testers, McNamara and Shohamy argue, need to develop more effective forms of advocacy and the mobilization of the people for whom such testing has consequences so that policy makers will no longer be able to ignore them.

Conclusion

In concluding, we would like to relate the work done in critical applied linguistics to critical discourse analysis (CDA). Critical applied linguistics has a number of points in common with CDA, and a number of ways in which it is rather different. Like critical applied linguistics, CDA aims to unpack power relations that are not evident, on first sight, to people, and it aims to bring about change. Critical applied linguistics, like CDA, describes and seeks to change inequities and discriminatory practices that are related to descriptions, perceptions, policies, and practices of language. Many of these issues are interrelated,

however, and while we may want to tease them apart by considering which subfield—critical applied linguistics or CDA—they belong to, it is not always easy to do so. Even in the summaries of key issues provided here, work in critical language policy, critical language codification, critical language teaching, learning, and testing is interrelated in multiple ways. For example, language codification efforts tend to focus on the language (or discourse) that is promoted through a language policy. Language tests then use these codified varieties as the “standard” language that has to be tested for various purposes. The tests in turn have a backwash effect on language teaching and learning. This inter-relatedness of both critical applied linguistics and CDA highlights the significance of being aware of the various subfields in critical applied linguistics as we develop our work in this area.

Another thing to be noted is that while many subfields use the label “critical” to mark their orientation to the field, other work or subfields might not. What is important is the goal of our work: to describe the processes through which positions of power, prestige, and authority are naturalized and, in doing so, resist them and bring about change, be it critical applied linguistics or CDA that we use as a framework for doing this.

Critical Discourse Analysis of Multilingual Interactions in the New Media

ALICE CHIK

Multilingual Interaction in New Media

User-friendly Web 2.0 tools allow Internet users to participate on a much larger scale than ever before, without having the same requirement for expertise in computer literacy (O'Reilly, 2005). These tools also give rise to Web sites that depended on users to generate content, like YouTube (video sharing) and Flickr (image sharing). The ease of creating and sharing content means that many of these Web sites are globalized platforms for user interactions. How does this emergence of new technological tools affect our concept of the Internet linguistic landscape? This is perhaps where critical discourse analysis (CDA) should be introduced as the analytical tool for understanding the social aspects of this new media phenomenon.

Critical Discourse Analysis

CDA adopts the approach that language is social practice, and thus discourse shapes, and in turn is shaped by, society. CDA is an appropriate analytical approach for analyzing multilingual online interaction because it engages discourse by "beginning with a social problem" (Fairclough, 2003, p. 209). Earlier CDA research on Web-based data has covered the semiotic, textual, and interactivity aspects of computer-mediated communication. With more than 1.67 billion Internet users worldwide (www.internetworldstats.com), any linguistic investigation without the application of CDA is missing out on the key sites at which social life constitutes, and in turn is constituted in, contemporary societies. There are two focal points in applying CDA to multilingual interaction in new media: the languages and media.

Multilingual Interaction: The Languages

Multilingual interaction can be viewed from two perspectives. First, multilingual interaction is seen as a result of "Internet users as members of one or more *speech communities* who bring to their online encounters shared knowledge, values, and expectations for linguistic interaction" (Danet & Herring, 2007, p. 7, original emphasis). Users of these Web 2.0 tools do not interact in a vacuum; they are transferring their lived experiences onto virtual domains. Therefore it will not be unreasonable to assume that users are tapping into their linguistic repertoires when accessing the Internet. From this perspective, it is the human interactions between users, through technological tools, which are multilingual. Second, multilingual interactions can also be viewed as users interacting with the Web site interfaces. Nowadays, most Web sites support multilanguage option access, or "multilingual accessibility" (Ivkovic & Lotherington, 2009, p. 24). Upon access to the Web sites, users

are immediately viewing more than one language simultaneously displayed there. The users' understanding of and navigation through these multilingual signs is another form of multilingual interactions.

At the moment English is still the dominant language used on the Internet, followed by Chinese, Spanish, Japanese, and French. Approximately 82.2% of global Internet users share the top 10 languages used on the Internet (www.internetworldstats.com). However, the visible presence of languages online depends heavily on physical access to technology. This means unequal technological access will lead to not only digital divide, but also digital linguistic divide. On the other hand, pockets of linguistic diaspora thrive in virtual spaces, giving smaller speech communities online presences (Mautner, 2005; Ivkovic & Lotherington, 2009). An earlier survey of Internet language use has shown that the use of English varies according to national contexts, and in most cases English coexists with other varieties of English and local languages (Block, 2004). The aforementioned Web sites, and other social media Web sites, continue to experience dramatic growth in their user populations, and this new wave of Internet technology is gradually changing the ways languages are displayed and used on the Web. Canagarajah (2006) argues that new forms of texts on the Internet will include English and "languages other than English embedded in otherwise English texts (as diverse dialects, registers, and languages now commonly inhabit the same textual space)" (p. 26). Viewing communication in the digital age as "the intersection between mobile people and mobile texts," Jacquemet (2005) argues that there should be a focus on "transidiomatic practice," or "the communicative practices of transnational groups that interact using different languages and communicative codes simultaneously present in a range of communicative channels, both local and distant" (pp. 264–5). English is but one visible language on the most popular Web sites. Nowadays, popular Web sites like Google and Wikipedia offer site interfaces in different languages. Among the top 10 most accessed Web sites (Google, Facebook, Yahoo!, YouTube, Live, Wikipedia, Blogger, Baidu, MSN, and QQ), only QQ is noticeably monolingual in its interface language options (www.alexa.com). All the other Web sites operate on multilingual platforms, with Wikipedia operating in 267 language editions.

Multilingual Interaction: The New Media

Researchers argue that what distinguishes new media, or Web 2.0, from the first generation of the Web is the difference between publication and participation. Users of the earlier Web can publish content, but the information published may only be known to a small group of more knowledgeable Internet users. Web 2.0 is not a revolution in hardware or a reconfiguration of the Internet. The new media have three characteristics: multimodality, interactivity, and hypertextuality (Kress, 2003). In other words, Web 2.0 allows users to publish interactive texts (including multimedia texts), participate to contribute content, and network through various platforms. The new media are both participatory and hyper-social (Jenkins, 2006; Ito et al., 2010). In other words, "new media" is used "to describe a media ecology where more traditional media such as books, television, and radio are intersecting with digital media, specifically interactive media and media for social communication" (Ito et al., 2010, p. 10). The concept of collaborative content authoring associated with many of these new media tools encourages a greater flow of participation. Many of the social media Web sites claimed collaboration and participation as prime features, for instance MySpace, Facebook, Blogger, and YouTube. And to a certain extent, these social media Web sites are gradually taking over the older generation of chatrooms and forum discussion as the prime sites for investigating multilingual interactions. Empirical studies on the use of language(s) in various new media, including instant messaging,

chatrooms, blogging, digital gaming, image sharing, and social networking, suggest that multilingual interaction is an emerging feature.

Multilingual Interaction: The Interaction

In a survey of eight countries (France, Italy, Macedonia, Oman, Poland, Tanzania, Indonesia, and Ukraine), the language choices that higher education students made depended on their language repertoires, and in many countries, computer sessions in their national languages have been found to comprise a much higher percentage than sessions in English (Kelly-Holmes, 2004). These findings are relevant in understanding synchronous, or simultaneous, computer-mediated communication (CMC). Peel (2004) found that Arab students favored Arabic over English as their language of choice for synchronous chatting. Other than language preferences, researchers into instant messaging in languages other than, or in addition to, English examine the linguistic creativity of the users. Lam (2004) describes how two young Hong Kong immigrants to the United States engaged in hybrid language practices involving romanized Cantonese, Cantonese-English code switching, and bilingual wordplay in bilingual chatrooms. Lee's (2007) study of text messages produced by Hong Kong university students shows that, in addition to the use of emoticons, the users draw on their linguistic knowledge of spoken Cantonese, standard written Chinese, and English to be creative in their Cantonese spelling and Cantonese-English code mixing.

Users of asynchronous CMC tools such as discussion forums and electronic bulletin boards (BBSs) are also linguistically resourceful. Su (2007) found Taiwanese Internet users creatively utilizing visual and auditory linguistic presentation by integrating Stylized English, Taiwanese-accented Mandarin, and Taiwanese in BBSs to achieve group solidarity, and show attitudes and ideology. Though Chinese is the dominant language used in these BBSs, Stylized English is used to signal Chinese transliteration, and thus is the more acceptable form of English use. The same innovativeness is also found among young Japanese users on BBSs, using strategies like unconventional spelling and punctuation (Nishimura, 2003). Participating in online discussion forums is often bilingual, if not multilingual. Hanna and de Nooy (2009) studied the moves of four French foreign-language learners' participation in the Parisian newspaper *Le Monde* online forums, and found that willingness to engage in debating, not linguistic competence, is the determining factor in participation.

Engaging in online interactions is the key to sustaining social networking. The interaction might have started off as a serendipitous encounter in vast cyberspace, but soon the networking relationship requires maintenance. Blogging is one of the more established Web 2.0 tools; Technorati has indexed more than 157 million blogs since 2004 (www.technorati.com). The sheer number of blogs will logically point to the existence of variations, from topics to language choices. Research has suggested that the vast number of blogs leads to a concentration of readers at the "head," or most popular, of the blogosphere, but there are only very few readers at the "tail" (for instance, a blog with only family and friends as readers). So a random survey of the most popular and visited blogs listed by Technorati shows English as the dominant language used, while blog-hopping in the blogosphere shows that there are many more bloggers publishing content and receiving comments in their usual language, or English, or both. Multilingual interactions in blogs might have been limited by the users' access. Other than chance stumbling, one has to know what to look for in specialized blogs.

Image- and video-sharing sites provide a different perspective on asynchronous interactions through commenting. YouTube operates in 22 different language editions, leaving plenty of space for viewers from different linguistic backgrounds to leave asynchronous comments to the same video. Massively popular YouTube music videos, like Lady Gaga's

Bad Romance, are good examples of interactive “complementary multilingualism” (Ivkovic & Lotherington, 2009, p. 24). The example that Ivkovic and Lotherington used to illustrate complementary multilingualism was the YouTube music video posting of *Moltiva*, the winner of the Eurosong 2007 contest. The song was originally performed in Serbian, but comments posted were in Finnish, French, English, Serbian, Croatian, Russian, and Slovene. Participants leave comments in their own languages assuming that the present and potential viewers of the video share one or more languages. This is not an exclusive case for the European context. For many of the YouTube music videos performed by popular South East Asian musicians, it is common to find viewers leaving multilingual comments. These videos may have been uploaded by fans, who have also written bilingual information about the song and the singer (usually in the local language and English). Two mega Asian pop singer-songwriters—Utada Hikaru, who has released albums in Japanese and English, and Faye Wong, who sings in Cantonese, Mandarin, English, and Japanese—are prime examples. Their fans left comments, and debated, in English, Japanese (both written and romanized), and Chinese (both simplified and traditional). In such cases, comments on the linguistic performances of these performers and attitudes toward national language far outweigh comments on musical appreciation in this type of discourse (Ivkovic & Lotherington, 2009).

In addition to video sharing, photo-sharing sites are attracting an increasing number of users. Flickr (Flickr.com) is an image- and video-hosting Web site which claims to host more than 4 billion images. When a user accesses Flickr, the first noticeable instance of multilingualism comes from the different ways of saying “hello” in different languages, generated automatically to greet the user. The images that users have uploaded are usually accompanied by title, description, and tags, and then other viewers can add comments. At any given moment, a random search for an image will already yield multilingual results. Davies (2009) first responded to one user’s photo set on cupcakes, and this led to chained responses. Flickr users from different parts of the world responded by commenting, posting their own visual narratives (accompanied by additional notes in their usual languages), and asking for English translation of these multilingual texts. Though the transactional language was English-dominant, the various cupcake photo sets received comments in languages other than English. These studies on hybrid media texts and interactions surveyed the potentials of both user–user and user–interface multilingual interactions, but CDA may offer the next step by critically exploring the social issues behind the production and consumption of such texts. The corporate and institutional Web sites surveyed in Ivkovic and Lotherington (2009) prompt discussion on issues of globalization; and by the same token, the friendship circle in Davies (2009) indicates that interactions on globalized online platforms might not be available to all users.

The proliferation of 3D graphical virtual worlds and multiuser virtual environments (MUVes), most notably Active Worlds (activeworlds.com) and Second Life (secondlife.com), exhibits other dimensions of multilingual interactions. Axelsson, Abelin, and Schroeder (2003) found that English- and non-English-speaking users in Active Worlds performed similar rituals to those of face-to-face interaction when encountering a non-English introduction. The acceptance or rejection of the introduced language depended heavily on the character of the setting, whether it was a general social or themed discussion, and the perceived intention of the language introducer. Language plurality is also more likely to be tolerated when fellow speakers are present. In Second Life, multilingual interactions are facilitated through language classes, and other formal and informal gatherings (Diehl & Prins, 2008). Although English is the usual language in Second Life, there are also linguistic islands and areas for residents who do not speak English as their usual language. In casual game play, for instance FarmVille, verbal or textual interactions are frequently

replaced by action game play. However, in massively multiplayer online games (MMOGs), which are especially popular among adolescents, gamers are both playing video games and conducting in-game conversation. The in-game chats between an American gamer and a Ukraine gamer in Thorne's (2008) study show that the use of Russian, Latin, and English (in both standard and text language) is driven first by the shared interest in gaming, and then expanded to mutual interests in music and life goals.

Researchers frequently suggest that shared interest is the starting point for multilingual interactions. Anime and manga (Japanese animation and comics) are fast becoming a major facilitating medium for online multilingual interactions. Ito et al. (2008) mention, for example, an American teenager collaborating with a peer in Spain to produce an online role play within a fan-fiction site; an 18-year-old Brazilian "anime music video" producer working creatively with Japanese-language animations; and "fansubbers" in Japan who add English subtitles to Japanese animations and post them on the Internet, often within hours of their appearance on Japanese TV. The multilingual collaboration could not have happened without the availability of Web 2.0 tools, but the interaction also went beyond partner authorship to participant sharing on social networking and media-sharing sites.

Multilingual Interaction in New Media: The Critical Perspective

When we revisit the starting point of employing CDA in understanding multilingual interactions, viewing language use on the Internet as shaping and being shaped by our contemporary societies, what do we learn and have yet to learn? First, the multilingual online interactions in new media reported here suggest that English may still be a dominant transactional language for online interactions, but increasingly, it is not the only language used by users. With the technological advance in online translation tools, we are also increasingly empowered to compose multilingual communication with a greater degree of accuracy. Second, as Ivkovic and Lotherington (2009) suggest, multilingual language use can also spark debate on nationalism and language rights. This brings forth the issue of whether the opportunities for multilingual interactions are conducive to multicultural understanding. Third, multilingual interaction is found to be most active in domains where users share some common interests. Research suggests that these interactions are found across different digital platforms, making "transidiomatic practice" (Jacquemet, 2005) perhaps a fruitful direction for further investigation. Finally, when we survey the top 10 Internet languages (English, Chinese, Spanish, Japanese, French, Portuguese, German, Arabic, Russian, and Korean), it is not difficult to note that they give a skewed representation of the physical world population. Languages with smaller speech communities are being left out in their digital presences. To a certain extent, the types of multilingual interactions discussed are more relevant to speakers of the top 10 languages, but not to speakers of minority languages. As Internet access expands and globalized online spaces continue to grow, we will witness and participate in more instances of multilingual interactions. The current body of research suggests that we have yet to fully explore the implications and impacts of new media communication and interaction. At present, the linguistic examination of new media practices is often separated from other modes of expression; thus, perhaps one possible way to advance research on multilingual interaction is to reconceptualize such interactions as one dimension of multimodal discourse. Language is but one mode in communicating multimodality, and in applying theories in multimodal discourse analysis, we may find new lenses in analyzing and understanding the various social actors in such digital multilingual interactions. It is important not only to see such interactions as a triumph of the fluidity of digital tools, but also to treat these interactions as the starting points from which to understand our contemporary societies.

Critical Discourse Analysis of Popular Culture

PATRICIA A. DUFF AND SANDRA ZAPPA-HOLLMAN

Introduction

Critical discourse analysis (CDA) is an approach to discourse analysis that has evolved over the past several decades. It is associated with work conducted since the 1980s by European linguists Norman Fairclough, Ruth Wodak, and Teun van Dijk and their colleagues but has become quite interdisciplinary as a scholarly practice. CDA also has its North American counterparts with their own interpretations of, and orientations to, critical discourse studies, a broader term, in the work of Gee (2004), for example, as well as scholars in other parts of the world (e.g., Australia, Asia). Traditionally, critical discourse analyses have examined formal media such as newspapers and oral, written, and visual (graphic) political discourse in other venues. However, CDA is also being applied to the analysis of popular culture texts, as illustrated in this entry, but generally by scholars in cultural studies and related fields, rather than in applied linguistics. Most of the work looking critically at popular culture (or “pop” culture, as it is also referred to in the literature) in applied linguistics investigates classroom practices involving, but not centrally concerned with the analysis of, pop culture texts. In what follows, we first provide a brief overview of CDA, followed by a discussion of its application to pop culture.

The Theoretical Foundations of CDA

CDA scholarship and pop culture research based in cultural studies both draw variously on poststructuralist orientations to discourse, Bourdieusian sociology, neo-Marxist theory, and critical feminist theory, as well as linguistics. Like other critical theory, CDA examines texts for evidence of unequal power relations among participants (including those referred to) in discursive events. CDA was influenced to a large degree in terms of both theory and methodology by critical linguists who embraced Hallidayan systemic functional linguistics, which has always placed importance on social and contextual aspects of language. The heterogeneity of CDA’s theoretical underpinnings and the analytical tools employed by critical discourse analysts make it difficult to define. Because of this, it can be viewed as a theoretical orientation, as a research program, or as a methodological framework, or all of these, for the study of written, spoken, and visual texts in social context, rather than as a school or paradigm. Yet there is general agreement about CDA’s overarching purpose: the examination of language use in society and the inequalities, asymmetries, and discriminatory or manipulative practices in discourse affecting the public. It is conceptualized by van Dijk (2001) as “a type of discourse analytical research that primarily studies the way social power abuse, dominance, and inequality are enacted, reproduced, and resisted by text and talk in the social and political context” (p. 352). Furthermore, Luke (2002, p. 100) notes:

2 CRITICAL DISCOURSE ANALYSIS OF POPULAR CULTURE

CDA involves a principled and transparent shunting back and forth between the micro-analysis of texts using varied tools of linguistic, semiotic, and literary analysis and the macroanalysis of social formations, institutions, and power relations that these texts index and construct.

Because CDA is concerned with the study of unequal social power relations, many CDA researchers focus on discrimination based on differences in race, gender, political views, ideologies, and social class, among other categories. Key concepts and terms in CDA studies therefore include *hegemony*, *power*, *dominance*, *resistance*, and *reproduction* (see van Dijk, 2001). Numerous journals regularly feature critical discourse studies of one type or another, for example, *Critical Discourse Studies*; *Critical Approaches to Discourse Analysis Across Disciplines*; *Discourse & Society*; *Social Semiotics*; *Journal of Language and Politics*; *Applied Linguistics*; and *Critical Inquiry in Language Studies*. In much of the work, researchers focus on “the intersection of language and social structure” (Blommaert & Bulcaen, 2000, p. 450) and often state their personal ideological positions explicitly (Wodak & Meyer, 2008). However, relatively few of these publications analyze the discourse of pop culture texts.

Applications of CDA to Pop Culture and Related Discursive Texts and Practices

As noted above, CDA has been taken up by researchers working in—and across—a range of disciplines in the social sciences and humanities in addition to (applied) linguistics. Given its orientation to power differentials and the potential exploitation of people with less power by those with more, political, economic, and institutional discourse has been a common focus for studies (e.g., Wodak, 1996). Furthermore, gender-based discrimination in the media, such as advertisements, and in popular teen magazines has been examined (Fairclough, 1995a, 1995b). In contemporary applied linguistics, especially in work on English as an international or additional language, CDA has been a preferred method for researchers embracing critical theory (e.g., Talmy, 2010) to examine talk (e.g., in classrooms) or texts used for instructional purposes. Parallel and sometimes earlier work in first language and literacy studies adopted CDA to examine asymmetrical power relationships in schools and other institutions and how they are reproduced through various educational discourse practices, to the disadvantage of those students who are already most vulnerable. Work of this sort analyzes texts based on classroom interactions, textbooks, and online technologies, and examines the kinds of identities and ideologies inculcated through the textual practices and problems associated with those.

Until now, however, relatively little research in applied linguistics has focused on the critical analysis of *pop culture* texts themselves, either in educational or non-educational settings. (For a discussion of how pop culture itself has been theorized and analyzed, see Storey, 2009a.) Some studies have, however, conducted analyses of cartoons, comic books, animations, television shows, and movies, hip-hop lyrics, tabloids (e.g., gossip columns) and videogames for the way they position (empower and disempower) particular types of participants or social actors or for the kinds of language and literacy practices they socialize students into. And, although pop culture is often discussed as a potentially very useful resource for bridging students’ vernacular and home literacies and interests with those of the school or university (e.g., Duff, 2004; Norton & Vanderheyden, 2004; Mackie & Norton, 2006; and a regular column in the *Journal of Adolescent and Adult Literacy* for many years), the texts must be examined carefully because of how characters and contexts are discursively constructed, marginalized, commodified, or mocked, based on their social or linguistic characteristics. The politics of representational practices, including visual, aural, and textual semiosis, must be examined.

What social and linguistic lessons are students actually learning through repeated, sanctioned exposure to such messages and construals? Research in critical media literacy and critical pedagogy seeks to address this question and offers possibilities for engaging with such textual practices in educational contexts where students become critical consumers, analysts, and producers of pop culture texts (e.g., Buckingham, 1998). It is therefore not just the pop culture texts themselves that merit deconstruction but participants' (e.g., students' and teachers') engagement with and appropriation of them inside and outside of class.

One of the most influential works of this sort in the 1990s, perhaps more a critical linguistic (phonological/sociolinguistic) analysis than a critical discourse analysis per se, was Lippi-Green's (1997) book, *English with an Accent*. She analyzed how the accented oral English of cartoon characters in Disney animations historically and in 24 contemporary children's animated films she examined (e.g., *Aladdin*, *The Lion King*, *The Jungle Book*) portrayed ethnolinguistic minorities (Jews, African Americans, Southerners) in disparaging and stigmatized ways. Such representational practices, she argued, reproduce social and linguistic stereotypes, ideologies, and identities that fan the flames of discrimination, beginning in the homes of very young children. Male African American Vernacular English speakers, for example, were associated with particularly unfortunate character roles in the films she analyzed, such as unemployed, purposeless humans or creatures (animals, birds). In television and movies, similar forms of linguistic stereotyping were reported, through the use of French or other European accents in English to mark the sexual desirability and availability of female characters, for example. Lippi-Green (1997, p. 103) concluded that

What children learn from the entertainment industry is to be comfortable with the same [accent or ethnicity as theirs] and to be wary about other, and that language is a prime and ready diagnostic for this division between what is approachable and what is best left alone.

Critical discourse analyses of tabloid literature (e.g., in English and Mandarin, respectively, in Britain and Taiwan) and for gender-based stereotypes, including the use of such terms as *hunky*, *curvy*, and *kinky* have appeared in recent issues of *Discourse & Society* (Wang, 2009, drawing on such diverse methodological tools as corpus linguistics, Caldas-Coulthard & Moon, 2010, and survey research combined with textual analysis). Indeed, issues of masculinities and (sexualized) femininities are central to many critical discourse studies of pop culture (e.g., chapters in Dines, 2003).

Considerable research has been conducted on the instructional uses of pop culture and new media, including videogames, simulations, social media sites, blogs, and movies, in language and literacy education. For example, Black (2006, 2009) examined the role of Japanese *anime*-based fan fiction, "writing in which fans use media narratives and pop cultural icons as inspiration for creating their own text" (p. 172). She demonstrated how pop culture (*anime*) and technology (Web sites) provided a context in which an adolescent English-language learner was able to develop a powerful, transcultural identity. The literacy practices themselves were found to be empowering to students, according to them, although the content of the *anime* was not critiqued. Similar positive effects of participation in virtual communities and vernacular discourse were reported by Lam (e.g., 2000, 2004) in the context of bilingual Chinese immigrant adolescents engaged with Internet-mediated chat-rooms. Duff (2004) urged applied linguists and educators to consider the implications of classroom discourse that includes passing references to pop culture (by both teachers and local students) and issues of access to the community and to learning, as well as to valuable language and content for English-language learners especially who may find themselves marginalized from such discourses. Norton and colleagues (Norton & Vanderheyden, 2004; Moffat & Norton, 2005), furthermore, demonstrate that *Archie* comic books, for instance,

are a common form of pop culture literacy practice for first and second language learners in North America, which often enable otherwise reluctant readers to take part in English literacy practices that they enjoy and help them enter into communities of practice with their peers and expanded forms of literacy thereafter. Nevertheless, sexism, commercialism or consumerism, and other messages in such texts need to be carefully deconstructed by teachers, parents, and readers and not assumed to simply be benign forms of entertainment.

Although critical analyses of pop culture texts themselves, and not just their value in bridging extracurricular and curricular learning objectives, have been plentiful in cultural studies (e.g., Dines, 2003), examining depictions of gender, sexuality, class, and race in relation to television shows, the internet, magazines, fiction, and icons such as Barbie dolls, applied linguists have been much less involved in such critiques based on discourse analysis. However, new genres and practices, associated with hip-hop culture(s) for example, are now being critically examined as creative, indigenous, globalized, and often multilingual and multimodal forms of representation, expression, play, and subversion in which language plays a crucial albeit often under-analyzed role (Alim & Pennycook, 2007; Alim, Ibrahim, & Pennycook, 2009). Thus, a growing number of international studies on hip-hop in applied linguistics, sociolinguistics, and anthropology now interrogate these practices and their theoretical significance from multiple perspectives.

Challenges and Future Directions for CDA Studies of Pop Culture

Critical discourse studies and pop culture are each very broad, interdisciplinary areas of scholarship, involving many kinds and modes of analysis, text types, and textual practices. Therefore, examining trends at the intersection of CDA and pop culture is not straightforward. Critical studies are often critiqued on the grounds of a priori ideological investments on the part of researchers with sometimes limited amounts of data presented, an issue confronted by some analysts but one that is still important to consider. The potential contributions of critical analyses of pop culture in contemporary pedagogy should be acknowledged, with recommendations for the participation of students themselves in CDA of pop culture in education settings. At the very minimum, students should be made more aware of linguistic and discursive means of representation, authority, and argumentation and how they are impacted by such devices.

To conclude, CDA represents a “critical turn” in discourse studies and applied linguistics, one considered to be among the “most influential and visible branches of discourse analysis,” according to Blommaert and Bulcaen (2000, p. 447). Indeed, there is great value in applying critical approaches to the study of pop culture discourse(s) in both educational contexts and society at large because of the pervasiveness, power, and significance of these textual practices for those engaged with them. As Luke (2002) writes, however, CDA poses certain challenges for applied linguistics and education, and having better-refined tools for the microanalysis of texts as well as a metalanguage to describe them would be helpful. Bogran (2010), for example, argues that better tools are needed for analyzing positioning, point of view, and meaning in texts. We therefore envision much future research addressing these challenges and possibilities in applied linguistics and education, particularly as more of the responsibility for the production and contestation of pop culture messages changes from large corporations to individuals and small groups of users, fans, critics, and creators.

Critical Discourse Analysis: History and New Developments

ADITI BHATIA

What Is CDA?

Critical discourse analysis (CDA) has often been regarded more as an alternative perspective to discourse analysis rather than a school or specialization (Van Dijk, 2001). CDA as a perspective “primarily studies the way social power, abuse, dominance, and inequality are enacted, reproduced, and resisted by texts and talk in social and political context. With such dissident research, critical discourse analysts take explicit positions, and thus want to understand, expose, and ultimately resist social inequality” (Van Dijk, 2001, p. 352). CDA is defined further by its attempt to demystify, through the analysis of various semiotic data, the ideological and asymmetrical power structures that inhibit social, political, and cultural processes. It is in fact possible to define the CDA perspective as

fundamentally concerned with analysing opaque as well as transparent structural relationships of dominance, discrimination, power and control as manifested in language. In other words, CDA aims to investigate critically social inequality as it is expressed, signalled, constituted, legitimized and so on by language use (or in discourse) . . . three concepts figure indispensably in all CDA: the concept of power, the concept of history, and the concept of ideology. (Wodak, 2001, pp. 2–3)

Origin and History of CDA

CDA’s focus on language and discourse originated from the “critical linguistics” that emerged (mostly in the UK and Australia) in the late 1970s. The terms “critical linguistics” and “critical discourse analysis” are often used interchangeably, with CDA becoming an increasingly preferred term, reflecting more accurately its roots, including rhetoric, text linguistics, sociolinguistics, applied linguistics, and pragmatics (Wodak & Meyer, 2009).

The mid-1960s and early 1970s saw growth in the dimensions common to the related disciplines that emerged in the humanities and social sciences, where, despite their “different disciplinary backgrounds and a great diversity of methods and objects of investigation, some parts of the new fields/paradigms/linguistics sub-disciplines of semiotics, pragmatics, psycho- and sociolinguistics, ethnography of speaking, conversation analysis and discourse studies all deal with discourse and have at least seven dimensions in common” (Wodak and Meyer, 2009, p. 2):

- an interest in the properties of real language by users in natural settings;
- a focus on texts, discourses, conversations, speech acts, or communicative events;
- a study of action and interaction;
- an interest in the nonverbal aspects of communication;
- a focus on the social and cognitive aspect of interaction;
- an investigation of the context of language use; and
- an analysis of the range of semantic-pragmatic-textual language use.

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

© 2013 Blackwell Publishing Ltd. Published 2013 by Blackwell Publishing Ltd.

DOI: 10.1002/9781405198431.wbeal0277

The network of critical discourse analysts grew from a symposium in Amsterdam in the early 1990s, which included scholars like Teun van Dijk, Norman Fairclough, Ruth Wodak, Theo van Leeuwen, and Gunther Kress. Of course since then scholars have developed, branched out, or even distanced themselves from the more traditional approach. Since “studies in CDA are multifarious, derived from quite different theoretical backgrounds, oriented towards different data and methodologies . . . [relying on] a variety of grammatical approaches . . . definitions of the terms ‘discourse’, ‘ideology’, ‘power’ and so on are also manifold” (Wodak & Meyer, 2009, p. 5), which has allowed CDA to remain a flexible school of thought, rigorous in debate, leading to positive development and growth in the objectives and agendas of the research that this school generates, thus conveying a more resilient, less categorical image.

Crucial Components of CDA

There may exist several distinct interpretations of CDA, but some of the basic tenets common to all address issues of power and language production in society, focusing on language as social practice and particularly on the context of language use. It is in this regard that CDA differs so significantly from discourse studies, since in addition to incorporating the above-mentioned dimensions in its analysis, it approaches its investigation in a problem-oriented, multidisciplinary manner; it is “not interested in investigating a linguistic unit per se but in studying social phenomena which are necessarily complex and thus require a multi-disciplinary and multi-methodical approach” (Wodak & Meyer, 2009, p. 2). It is for this reason that this particular perspective on discourse employs the term “critical,” which is often wrongly misinterpreted to mean a negative assessment of crucial social and political issues and events, although in fact the objects of inquiry for CDA are often common societal processes that can transform into the focus of “critical” inquiry.

The “Critical” in Discourse Analysis

Perhaps what can be regarded as a dominant characteristic of CDA is its belief that language is social practice (Fairclough, 1989; Fairclough & Wodak, 1997), meaning that discourse both shapes and is shaped by society. Discursive events share a co-constitutive relationship with the social, institutional, and professional contexts within which they take place. They are socially conditioned by the local and macro contexts in which they occur, but at the same time the discursive events shape the social identities and relationships of the participants engaged in these events themselves. As Fairclough and Wodak (1997, p. 258) state,

discourse is socially constitutive as well as socially conditioned—it constitutes situations, objects of knowledge, and the social identities of and relationships between people and groups of people. It is constitutive both in the sense that it helps to sustain and reproduce the social status quo, and in the sense that it contributes to transforming it. Since discourse is so socially consequential, it gives rise to important issues of power. Discursive practices may have major ideological effects—that is, they can help produce and reproduce unequal power relations between (for instance) social classes, women and men, and ethnic/cultural majorities and minorities through the ways in which they represent things and position people.

The “Discourse” in Critical Analysis

As mentioned earlier, the diversity in the interpretation of CDA often lies in the multifarious definitions offered of crucial concepts, including the term “discourse,” which many

scholars and academics have tried to shape in terms of their distinct approaches to CDA. One dominant definition comes from Foucault (1972, p. 80), who identifies discourse “(1) sometimes as the general domain of all statements, (2) sometimes as an individualizable group of statements, and (3) sometimes as a regulated practice that accounts for a number of statements.” Mills (1997) states that the first of the three definitions that Foucault offers is perhaps the broadest and most generally applicable at a theoretical level. The second definition describes discourse as an individualizable group of statements, internally structured and regulated, having coherence and a force in common. The third definition, “a regulated practice that accounts for a number of statements,” deals with discourse as rule-governed, focusing on the conventions that produce statements and texts.

Foucault (1989) in his concept of discourse also emphasizes the importance of context and history, explaining that discourse is not simply a linguistic practice; it is about the representation of reality, the practice of it, again illustrating the fundamental view that CDA has of discourse as social practice. Discourse, for Foucault, is made of statements, which he considers as atoms of discourse, in the way sentences are atoms of a text. Similarly, Ricento (2003) in his study states that discourses are not simply in the moment; they are “sites of action, not static receptacles or artifacts. They represent beliefs based on the interpretation of events and, in turn, help shape future events. They are windows into the lifeways of a culture and society” (p. 630).

Fairclough (2003) presents an interpretation of discourse that varies slightly from that of Foucault, considering it “as ways of representing aspects of the world—the processes, relations and structures of the material world, the ‘mental world’ of thoughts, feelings, beliefs and so forth, and the social world” (p. 124). Discourses are different conceptions of the world, connected to the different relations people have with the world, depending on their social positions. Fairclough further emphasizes that discourses are “projective, imaginaries, representing possible worlds, which are different from the actual world, and tied in to projects to change the world in particular directions” (p. 124).

“Discourse” thus in CDA refers not to a single piece of text, which may very well be no more than a unit of discourse, but rather to the social process of creating meaning. Discourse, then, is the end product of the creation and interpretation of semiotic variables.

Crucial Components of CDA

The crux of CDA is formed by the fusion of language, discourse, and social structure, consisting of eight primary characteristics (McKenna, 2004):

1. *Teleology*: CDA is committed to unveiling the power structures in society in what can be seen as its bid to solve problems caused by practical action. It has a “teleological commitment to justice, democracy, equality, and fairness” (p. 10).
2. *Theory of discourse*: CDA is distinguished from mere discourse analysis in that it studies text in an interdiscursive and intertextual manner in the process of meaning making.
3. *Materialism*: CDA treats language as more than just a random linguistic process; discourse is given meaning by social action, and takes place within a complex sociocultural framework, whereby “social context relates to textual production” (p. 11).
4. *Historicity*: CDA acknowledges that texts and utterances are a product of our habitus and thus indicative “of the spatio-temporality of any textual production and [accommodating] the diachronicity of discourse” (p. 12).
5. *Constructionism and constructivism*: CDA investigates how language is both constitutive of and an expression of social structures.
6. *Theories of subject*: “Because the concept of subject incorporates issue of agency and constructedness, it is a crucial aspect of critical discourse studies . . . [leading to the understanding of] an external and an internal form of subjectivity” (pp. 12–13).

4 CRITICAL DISCOURSE ANALYSIS: HISTORY & NEW DEVELOPMENTS

7. *Ideology*: Discursive practices are a reflection of our subjective understanding of the world, and hence our ideologies. Discourses can be seen as an expression of our ideologies and yet constitutive of them.
8. *Power*: Ideologically infused discourses reflect power struggles in society that in turn categorize and structure society. They put forward subjective versions of reality with the purpose of information processing, distribution and retention of power, creating in-group exclusivity, and setting standards for normative behavior.

Fairclough (1989, p. 5) elaborates on the way CDA investigates the relationship between language, power, and ideology, analyzing “social interactions in a way which focuses upon their linguistic elements, which sets out to show up their generally hidden determinants in the system of social relationships, as well as hidden effects they may have upon that system.” Fowler (1996, p. 3) further points out that CDA is “designed to get at the ideology coded implicitly behind the overt propositions, to examine it particularly in the context of social formations.” Power has the capacity to create and maintain a hierarchical demarcation in social institutions (Fairclough, 1989). CDA, recognizing this capacity of power-generated hierarchical structures, tends to make these hidden connections obvious to the recipients of it. As Calsamiglia and Van Dijk (2004, p. 370) write,

popularization discourse needs to be formulated in such a way that non-specialized readers are able to construct lay versions of specialized knowledge and integrate these with their existing knowledge. Thus, various strategies of explanation, such as definitions, examples, or metaphors, among many others, are the semantic means that allow language users to relate new knowledge to old knowledge.

CDA aids in the process of deciphering the impact of powerful ideologies on discursive practices; how discourse is popularized, or converted from specialized knowledge into lay knowledge, and what are the consequences of this sort of recontextualization, where “discursive practices are cut off from their embeddedness in action and transformed into discourses which are articulated together in new ways according to the logic of the recontextualizing practice: and transformed from real to imaginary, and bought into the space of ideology” (Fairclough, 1999, pp. 70–1). Outcomes of ideological discourses may include the partial distribution of power and reinforcement of the status quo; the creation of stereotypes and categories; even the subjective understanding of reality that is conveyed through media representation and which then determines the reality for a collective populace.

With a focus on critical language study, Fairclough (1995, p. 28) emphasizes the importance of investigating local microstructures and the more interlaced macro events of society: “The critical approach has its theoretical underpinnings in views of the relationship between ‘micro’ . . . and ‘macro’ structures which see the latter as both the conditions for and the products of the former and which therefore reject rigid barriers between the study of the ‘micro’ . . . and the study of the ‘macro’” (Fairclough, 1995, p. 28). His dialectical-relational approach to CDA is based on his three dimensions of discourse, namely text, discourse practice, and sociocultural practice, and similarly the analysis of discourse integrates description, interpretation, and explanation of data, as represented in Figure 1 (see Fairclough, 1995, p. 59).

For Fairclough (1989), discourse, which bears witness to power and ideology in society, is an amalgamation of text, interaction, and social context, within which he draws the distinction of “description of text, interpretation of the relationship between text and interaction, and explanation of the relationship between interaction and social context” (p. 109).

Figure 1 Dialectical-relational approach to CDA (adapted from Fairclough, 1995, p. 59)

In a similar manner, Van Dijk's (1993) sociocognitive approach to research perceives CDA as an instrument of analyzing power structures in discourse; as he mentions, "critical discourse analysis is specifically interested in power *abuse*, that is in breaches of laws, rules and principles of democracy, equality and justice by those who wield power" (pp. 254–5). Van Dijk elaborates further by saying CDA examines the way in which powerful gatekeepers in society influence social beliefs and values, and shape ideologies, through the standards they set for what is and is not acceptable. In other words, CDA explores power asymmetry in discourse. This approach's

focal triad is construed between discourse, cognition and society. Discourse is seen as a communicative event, including conversational interaction, written text, as well as associated gestures, facework, typographical layout, images and any other "semiotic" or multi-media dimension of signification. Van Dijk relies on socio-cognitive theory-splints and understands linguistics in a broad "structural-functional" sense. He argues that CDA should be based on a sound theory of context. Within this claim, the theory of social representations plays a main part: Social actors involved in discourse do not only use their individual experiences and strategies, they rely mainly upon collective frames of perceptions, called social representations. (Wodak & Meyer, 2009, pp. 25–6)

Wodak's (2002) discourse-historical approach expands on the basic principles of CDA by adding a historical dimension, integrating "a large quantity of available knowledge about the historical sources and the background of the social and political fields in which discursive 'events' are embedded. Further, it analyses the historical dimension of discursive

Figure 2 Primary research strategies and theoretical approaches in CDA (adapted from Wodak & Meyer, 2009, p. 20)

actions by exploring the ways in which particular genres of discourse are subject to diachronic change" (Wodak, 2001, p. 65). The discourse-historical approach aims to make explicit the relations between discourses and the historical and sociopolitical contexts within which they are embedded. Discourses are multilayered, often connecting with and recontextualizing others; as a consequence, they are often filled with paradoxes, contradictions, and inconsistencies. Exploring, in addition to the facets mentioned above, the historicity of discourses and discursive events, allows the opportunity to discover possible inconsistencies in discourses and demystify—in other words, bring into focus as much as possible—the historical dimension and manipulative character of discursive practices (Wodak, 2001). Figure 2 illustrates some primary research strategies and theoretical approaches in CDA (see Wodak & Meyer, 2009).

Recent Developments in CDA

There has been a growing trend in CDA toward the integration of cognitive linguistics. Research approaches of this capacity include Charteris-Black's (2004, 2005) critical metaphor analysis (CMA) approach, which attempts to identify and investigate metaphors convey the intention, motivations, and ideologies that underlie language use. CMA can be defined as an "integration of cognitive semantic and pragmatic approaches that is based on corpus evidence" (Charteris-Black, 2004, p. 13). The approach most usefully takes into consideration the speaker's or writer's intention with regard to the creation and diffusion of metaphor by blending both cognitive and pragmatic perspectives, recognizing that although metaphor is not just a linguistic phenomenon, in the language of persuasion writers and speakers "use metaphor to persuade by combining the cognitive and linguistic resources at their disposal" (2004, p. 11). Focusing his research largely on political discourse, Charteris-Black explains that CMA attempts to

identify *which* metaphors are chosen and to explain *why* these metaphors are chosen by illustrating *how* they create political myths . . . [in addition to indicating] how the metaphors of one social or political group may be taken over, exploited and developed by those of another for competing ideological ends. (2004, pp. 28–9)

Scholars have increasingly emphasized the role and importance of cognitive linguistics in the critical reflection of discourse, as Hart and Lukes (2007, p. xi) state: "So far, the application of Cognitive Linguistics in critical discourse analysis has in the main been

restricted to conceptual metaphor theory... Whilst we recognise the importance of conceptual metaphor theory in critical discourse analysis... its appropriation is also challenged." They continue by mentioning that cognitive linguistics presents a "rich and varied theoretical world" (p. xi), which needs to be considered for appropriation and integration, "including conceptual metaphor theory, conceptual blending theory and frame semantics, as well as developing theories, such as metaphor power theory and discourse space theory" (p. xi). This is just one development in the ever-growing and dynamic approach to discourse studies, which is altered, adapted, and molded by researchers in various disciplines to investigate the thickly layered discourses that are shaped by and in turn shape an ever-developing society.

Critical Discourse Analysis: Overview

ANGEL LIN

Critical discourse analysis (CDA) as a young discipline has a history of only about three decades. While it might be possible to see CDA as a particular approach to discourse analysis rather than a separate discipline, CDA's disciplinary status has been well established through its research journals and the influential work of key researchers associated with CDA; for example, Norman FAIRCLOUGH, Gunther Kress, Ruth WODAK, Teun van Dijk, and Theo van Leeuwen (see CRITICAL ANALYSIS OF POLITICAL DISCOURSE).

As a young discipline, however, it has drawn on theoretical resources dating back to European Enlightenment philosophy. From the critique of metaphysics by Immanuel Kant (1724–1804) to the critical theory of the Frankfurt School in the twentieth century, CDA is a true descendant of the Anglo-European tradition of placing faith and value in applying the human rational faculty to the critical analysis of political, social, and cultural formations of various kinds (e.g., race, class, and gender categories) (see “CRITICAL” IN CRITICAL DISCOURSE ANALYSIS).

With its fluid and fast developing research questions and diverse methodologies worthy of an energetic young discipline, CDA is often a somewhat different thing to different researchers and scholars with slightly different theoretical or methodological preferences. And yet what unites these seemingly diverse efforts in CDA inquiry is CDA's central concern with different forms of social inequality and domination and subordination that are being produced and reproduced through language and discourse, and its commitment to working towards effecting change and improvement of such situations. This central concern and commitment underlie a nexus of basic theoretical concepts and research methodologies in CDA, which are outlined below as a synoptic introduction to this section.

Language as Social Practice

One key distinction between CDA and discourse studies lies in CDA's consistent focus on language as social practice and particularly on the social and political context of language use. CDA is not interested in investigating language as a static linguistic entity but in studying social and discursive processes and their consequences (see CRITICAL DISCOURSE ANALYSIS: HISTORY AND NEW DEVELOPMENTS). In particular, CDA takes the theoretical stance that language should not be seen as a reified object of study, and language treated as a bounded entity is actually an ideological and social construct, born of activities of political, nationalist, or colonial, segregating agendas (Pennycook, 2001, 2003, 2004, 2010). The analytical focus should thus be on how language, as continuously changing systems of semiotic resources, among other semiotic systems of resources (e.g., multimodality, see CRITICAL ANALYSIS OF MULTIMODAL DISCOURSE), are recruited and utilized for constructing racial, gender, social, and cultural categories that legitimate and perpetuate inequalities in society. In this respect CDA shares much in common with the recent “critical turn” in applied linguistics, or what comes to be known as critical applied linguistics (CAL). The two disciplines can be seen as sister disciplines that mutually inform each other, with CAL focusing more on applied linguistics issues such as language policy, language ideologies, language teaching, language learning, and language testing (see CRITICAL DISCOURSE ANALYSIS AND CRITICAL APPLIED LINGUISTICS).

Discursive Construction of Racial and Social Categories/Identities and the Politics of Representation

One central concern of CDA research is to critically analyze the discursive construction of racial, gender, and other social and cultural categories, identities, and stereotypes that legitimate and perpetuate discrimination against particular groups of people. Much of early CDA work focuses on the critical analysis of “race” as a discursive construction, the role of discourse in racialization processes, and the reproduction of racialized identities and discrimination of marginalized groups in society (see CRITICAL ANALYSIS OF POLITICAL DISCOURSE).

Key CDA research conducted by Teun van Dijk uses both linguistic and social psychological approaches to the critical analysis of racist discourses of the White ruling elites in European, British, Australian, New Zealand, North American, Latin American, and South African societies (van Dijk, 1993, 2005; Wodak & van Dijk, 2000). Van Dijk’s classic 1993 study critically analyzed racist discourses from all key domains: political discourse, corporate discourse, academic discourse, educational discourse, and media discourse. In this important study, van Dijk both integrated and theoretically elaborated his earlier research on racism and the press (van Dijk, 1991) and ethnic prejudice in thought and talk (van Dijk, 1987). Van Dijk differentiated between elite racism and popular racism and argued that it is the racist discourses of the elites in different domains of society that provide both the cognitive frameworks and the discursive resources for the reproduction of ethnic stereotypes in everyday talk and thought of the masses.

Drawing on Bourdieu (1984, 1988), van Dijk further saw these elites as playing an important role in the authorization and legitimation of racist policies and everyday racist practices. Almost outperforming their earlier colonial predecessors, contemporary elites, van Dijk argued, employ a range of sophisticated forms of discourse to legitimate their own social, political, language, and economic policies that safeguard their elite status and privilege in society (van Dijk, 1993).

Expanding Domains of Analysis and Interdisciplinary Methodologies

Apart from deconstructing the categories of race and racist representations, CDA researchers have also worked on uncovering the stereotypical representations of different social and cultural groups, using diverse methodologies, and in a variety of domains, including educational settings (see CRITICAL ANALYSIS OF DISCOURSE IN EDUCATIONAL SETTINGS), the new media (see CRITICAL DISCOURSE ANALYSIS OF MULTILINGUAL INTERACTIONS IN THE NEW MEDIA), and popular culture (see CRITICAL DISCOURSE ANALYSIS OF POPULAR CULTURE). With the rise of new media it is increasingly important to employ new methodologies to analyze visual images and multimedia texts (Kress & van Leeuwen, 1996). Multimodal approaches to CDA have thus made great contributions to enriching the repertoire of methodological tools available to CDA researchers (see CRITICAL ANALYSIS OF MULTIMODAL DISCOURSE). This entry shows how the Playmobil toy figurines and accessories construct reality in specific ways. For instance, the Playmobil “ethnic family box” contains a father, a mother, and three children, all with brown skin and identical hair color, with a mother who wears her hair in a bun. The Playmobil “family” (with no further qualification), in contrast, comes in a box with a father, a mother, and two children, all pink-skinned and with different hair colors, hence with some suggestion of individuality.

CDA’s methodology has sometimes been criticized as subjective and not “scientific”: for example, CDA researchers typically choose text examples to support their analytical

claims without first establishing a representative sample of texts to conduct their analysis (see “CRITICAL” IN CRITICAL DISCOURSE ANALYSIS). In recent years, however, more and more CDA researchers are integrating corpus linguistic methods into their methodology. Corpus-based methods have complemented traditional CDA methods well by using random sampling, analyzing a large collection of texts, and comparing the textual features under study with language norms captured in a corpus in order to make reliable generalizations about typical language use (see CORPUS-BASED LINGUISTIC APPROACHES TO CRITICAL DISCOURSE ANALYSIS).

Entries Collected in This Section

To introduce this energetic young “transdisciplinary” discipline with all its fluid and fast developing issues and diverse methodologies presents a daunting task. The contributors of the eleven entries collected in this section have done an exemplary job within the limited assigned space. The first entry starts off by problematizing the “critical” in CDA through tracing the etymological roots of the word and the philosophical sources of the discipline (see “CRITICAL” IN CRITICAL DISCOURSE ANALYSIS). The entry summarizes two major critiques of CDA: one is philosophical and the other is methodological. The philosophical critique is based on the postmodernist orientation towards plurality of values across different cultural systems of the world. If CDA has a basic ethical concern about uncovering social injustice then there is the question regarding CDA’s claims about social injustice; for example, an instance of social injustice seen in one culture might not be seen that way in another culture. While this entry has put forward this question to CDA researchers only recently, the deeper theoretical debate has in fact long been carried out in critical cultural studies: Is critical theory still tenable in the face of challenges from postmodernist philosophies? It seems to me that CDA researchers can draw on some theoretical resources from post-Marxist responses to postmodernism (e.g., Laclau & Mouffe, 1985; Chen, 1996). For instance, if CDA is both seen and carried out as a situated practice and not as a set of universal theoretical claims, then the postmodernist challenge should not be fatal to CDA.

The methodological critique summarized by the author has to do with the methods of selecting text samples in CDA practice. CDA researchers have been criticized for selecting only those samples of texts that support their claims and not paying attention to other texts that do not support their claims. In a way, this critique is answered by the next two entries. The entry CRITICAL DISCOURSE ANALYSIS: HISTORY AND NEW DEVELOPMENTS provides an overview of the historical development of CDA as a discipline from its early association with critical linguistics (Fowler, Hodge, Kress, & Trew, 1979; Fowler, 1996) to its recent strengthening of its methodologies by integrating concepts and methods of corpus linguistics and cognitive linguistics (e.g., Charteris-Black, 2004, 2005). The entry CORPUS-BASED LINGUISTIC APPROACHES TO CRITICAL DISCOURSE ANALYSIS further provides a comprehensive account of the recent development of applying corpus-based approaches to CDA and how corpus linguistics has contributed to the methodological repertoire of CDA in response to criticism about lack of systematic representative text sampling procedure in CDA research.

The entry CRITICAL DISCOURSE ANALYSIS AND CRITICAL APPLIED LINGUISTICS offers us an overview of critical applied linguistics (CAL) and shows how much both CDA and CAL share in common, with CAL focusing more on social inequalities arising from language ideologies and legitimated ideological language policies and language education practices. CRITICAL ANALYSIS OF MULTIMODAL DISCOURSE further advances our knowledge of the relationship between multimodality analysis and CDA. Although the two disciplines have developed independently, there are multimodality researchers with a critical concern, and

4 CRITICAL DISCOURSE ANALYSIS: OVERVIEW

CDA researchers who employ multimodal analysis methodologies to analyze visual images and multimodal texts, as images construct reality in ideological ways just as much as language does, if not more. The entry **CRITICAL ANALYSIS OF POLITICAL DISCOURSE** further describes the historical development of CDA work in political domains, in particular, illustrating the value of longitudinal analysis with the contributor's own study that tracks the political discourse of British governors in their last years of colonial rule in Hong Kong in the 1990s. **CRITICAL ANALYSIS OF DISCOURSE IN EDUCATIONAL SETTINGS** offers an account of CDA research in educational settings, illustrating that while historically CDA started off with concerns mainly with political and media discourse, CDA practice is very important in uncovering the working of ideologies and inequalities in education domains.

With much recent global corporate and popular discourse celebrating the new media and Internet as emancipatory and democratic, **CRITICAL DISCOURSE ANALYSIS OF POPULAR CULTURE** gives a note of caution on critical analysis of popular culture. It also points out that there is great value in applying critical approaches to the study of popular culture discourse(s) in both educational settings and society at large given the pervasiveness, power, and significance of these textual practices. Related to this topic is the entry on the increasing presence of multilingual, multimodal interactions in the new social media (see **CRITICAL DISCOURSE ANALYSIS OF MULTILINGUAL INTERACTIONS IN THE NEW MEDIA**). Although this entry deals mainly with these new sociolinguistic phenomena, it points to the need for more future CDA research in the new media which are increasingly characterized by superdiversity and "supervernacularization" in communication patterns and networks of these virtual "supercommunities" (Blommaert, 2011).

This collection devotes its final two entries to biographical accounts of two central figures in the development of CDA as a discipline: Norman FAIRCLOUGH and Ruth WODAK. From the perspective of an applied and educational linguist, the contributor describes the development of the work of Norman Fairclough and his contribution to the transdisciplinary nature of CDA emphasizing how Fairclough integrated critical social theory into textual analysis of discourse. The entry on Ruth Wodak details her contribution, stressing her role not only as an academic and researcher but, much more importantly, also as a public intellectual deeply committed to the battle against racism, anti-Semitism, and right-wing populist rhetoric in Austria and Europe. The future of CDA, as the contributors in this section all point out, is still fluid, dynamic, and very much in the making. With its commitment to critical analysis of the discursive processes of domination and subordination, social injustice, and symbolic violence, CDA continues to make important contributions to the theory and practice of applied linguists.

Critical English for Academic Purposes

SARAH BENESCH

Introduction

This entry traces critical English for academic purposes (CEAP) from its first publications, in the early 1990s, to its more recent offerings. It begins by defining CEAP, first in relationship to traditional English for academic purposes (EAP), and then through its disciplinary positioning. Theoretical differences between CEAP and EAP are then explored. Finally, a 2009 *Journal of English for Academic Purposes* special issue on CEAP is examined to illustrate how these theoretical assumptions drive its current praxis.

The Relationship Between EAP and CEAP

A starting point in defining critical EAP is a definition of traditional EAP, for which I turn to Hyland and Hamp-Lyons (2002). They describe EAP as a field that aims to help English language learners “gain fluency in the conventions of English language academic discourses” so that they might “successfully navigate their learning” (p. 1) in various disciplines. Critical EAP, on the other hand, while retaining the aim of helping students navigate academic discourses and disciplines, challenges the notion of academic conventions as necessarily reasonable and non-negotiable. Instead, CEAP sees students as active agents, rather than novices or subordinates, who can be encouraged to question unreasonable requirements and collaborate with their instructors in developing appropriate curricula.

Another way of defining CEAP is by locating its disciplinary home: Is it a subfield of EAP? Or is it, instead, more closely allied with critical applied linguistics (CAL)? The status of a field, or subfield, might be measured by whether there are journals devoted to its scholarship. According to this criterion, EAP is an established field with a dedicated scholarly journal, *Journal of English for Academic Purposes* (JEAP), and, to a lesser degree, *English for Specific Purposes* (ESP). As to CAL, there are at least two applied linguistics journals that solicit manuscripts with a critical orientation: *Critical Inquiry in Language Studies* and *Journal of Language, Identity, and Education*. CEAP, by contrast, has no dedicated journals, though critical EAP scholarship is represented in both JEAP (Cadman, 2005; Benesch, 2009) and ESP (Harwood & Hadley, 2004; Archer, 2008). In addition, critical EAP articles can be found in journals receptive to submissions with a critical orientation, such as *TESOL Quarterly* (Benesch, 1996; Angelil-Carter, 1997; Thesen, 1997) and *Journal of Second Language Writing* (Casanave, 2003; Kubota & Lehner, 2004).

Determining where CEAP “belongs” in the disciplinary landscape is even thornier when considering that CAL may not even be a field or subfield, but, instead, a “form of anti-disciplinary praxis” (Pennycook, 2001, p. 164). From this perspective CAL is a continuous process of interrogating theory and practice rather than a bounded discipline. While acknowledging this perspective, I prefer to regard CEAP as an inter-discipline, incorporating aims and assumptions of both EAP and CAL. In this entry I discuss how CEAP has enacted “problematizing practice” (p. 167), a nonfoundational stance through which it retains its critical edge. Yet, I also show that CEAP has not acted exclusively as an *enfant*

terrible, attempting to push EAP beyond its zones of foundational comfort. Rather, there is a substantive CEAP literature grounded in shared theoretical assumptions, one that supports the claim that CEAP is an established presence in applied linguistics, in its own interdisciplinary right.

To demonstrate CEAP's development from an EAP counterdiscourse to its current status as an inter-discipline, I'll next discuss some early CEAP publications from the 1990s. In these articles, CEAP offered an alternative to EAP by theorizing power in three areas: language; pedagogy; teachers' and students' complex and shifting identities.

Theorizing Language and Pedagogy: Attention to Power

Pennycook (1994) offered the earliest challenge to EAP's theory of language, questioning a fundamental, yet unexamined, EAP assumption: languages are conduits of meaning, that is, "channel[s] through which ideas can pass back and forth unchanged" (p. 13). Pennycook pointed out that English *for* academic purposes implies that language is a neutral vehicle for transporting academic content. This formulation, he claimed, promoted a theory of language as an innocent and transparent medium through which academic purposes could be achieved. Pennycook's counterproposal was English *as* academic purposes. The shift from *for* to *as* highlighted the politics of English, suggesting "a critical stance that recognizes the ways in which English is embedded in social, cultural, and political relations" (p. 14).

In questioning English *for* academic purposes, Pennycook underscored EAP's tacit acceptance of a structuralist theory of language, with its language/content divide, and its view of language and social factors as separate rather than inextricably linked. In place of structuralism, Pennycook proposed a poststructural theory of language as discourse(s), where language is "a social practice . . . and always/already social and cultural" (p. 17). This theory of discourses acknowledged power by positing language as a site of struggle, that is, discourses competing for legitimacy within social contexts, in which power is unequal. From this poststructural perspective, academic texts, genres, and assignments are not content-delivery devices that help students achieve their goals, but are instead socially constructed artifacts open to "multiple readings from diverse discursive positions" (p. 20). Critical EAP, then, would invite students to examine their complex relationships and reactions to academic English, including possible ambivalence, and to develop novel understandings in light of their subject positions.

Whereas Pennycook was concerned primarily with theories of language, my focus was pedagogy. Through the lens of unequal power in academia, I critiqued EAP's unequivocal endorsement of the literacy demands of academic courses, questioning whether they were in fact "positive artifacts of a normative academic culture into which ESL students should be assimilated" (Benesch, 1993, p. 710). Though I endorsed EAP's move away from general English to more specific academic discourse, genres, and assignments, I did not accept them as necessarily "realistic" and "authentic," as the EAP literature claimed. Rather, I countered that academic requirements and assignments were sometimes capricious and ill conceived and therefore problematic as target materials. In this and other articles published around the same time (Benesch, 1988, 1991, 1992), I attributed EAP's unquestioning acceptance of academic materials to the subordinate status of ESL instructors and students in the academy. Their role, according to mainstream EAP practice at the time, was to make content course materials comprehensible to EAP students. Missing from this equation was EAP's potential for challenging the status quo of unfavorable conditions, so that faculty across the curriculum might develop more appropriate assignments, ones geared to their actual students rather than imagined, better-prepared ones.

Theorizing Teachers' and Students' Complex and Shifting Identities

Articles concerned primarily with students' complex identities in EAP contexts began to appear in the late 1990s. As in the earlier critical EAP publications, the central issue was power, another challenge to EAP's quietism regarding social inequality, including in academic settings. Two articles (Angelil-Carter, 1997; Thesen, 1997) emerged from the University of Cape Town (UCT) at a time when South African post-secondary institutions were admitting black students to historically white universities. Angelil-Carter (1997) aimed to discover how previously excluded students "develop an authorial voice within multivoiced text in academic writing" (p. 269), by interviewing a native speaker of Zulu who had been a political prisoner before enrolling in UCT. Grounding her research in Bourdieu's notion of the linguistic marketplace where discourses compete for legitimacy, the author was concerned with how "subject positions, and thus the ability to claim the right to speak and be heard can shift" (p. 264).

Angelil-Carter illustrated changing subject positions in her discussion of the interview process itself, documenting how power shifted between her and the student, depending on the topic, institutional roles, race, and gender. Concluding that power shifts even in a single encounter, such as an interview or classroom exchange, the author called for more nuanced explorations of teachers' and students' identities, through greater attention to the intersection of language, power, and identity within and outside of academic settings.

Thesen (1997), too, conducted interviews with black English language learners at UCT, to explore "the dynamics of identity construction" (p. 488). Hoping to subvert the *disadvantaged* label misapplied to these students, and the traditional EAP notion of initiating novices to the academic mainstream, she focused on *transitions*, from rural schools to an urban university, political writing to academic writing, and first language to other languages. Thesen believed that the university had failed to interrogate its own white privilege vis-à-vis the newly admitted black students and to "adjust itself to the new realities" (p. 490). She therefore hoped to uncover how students' various oral and written discourses, nonacademic and academic, informed each other, from the students' perspective. She discovered that far from being passively disadvantaged, the students were actively constructing "emergent identities across different contexts in which [they] are clearly agentive, making choices about where to merge and where to resist" (p. 504). Given her finding that students' identities were not fixed, but "in movement" (p. 506), Thesen encouraged greater student input into how they are positioned institutionally.

It is clear from the examples of early CEAP scholarship that EAP provoked the counterdiscourses of CEAP. Yet, it is also true that CEAP has influenced EAP, by raising theoretical and methodological questions. The degree to which these questions have attracted EAP researchers is taken up in the next section.

What Have Been CEAP's Influences on EAP?

By the time *JEAP* appeared in 2002, CEAP had made sufficient inroads that the editors of this newly launched journal acknowledged its influence. In their first editorial, Hyland and Hamp-Lyons wrestled with the "extent to which EAP is a pragmatic or critical discipline" (2002, p. 9). They wondered whether the goal was to facilitate students' "effective participation in academic communities" or if there was an additional mandate "to provide learners with ways of examining the academic socio-political status quo" (p. 9). The tension, as they described it, was between reproducing "existing forms of discourse (and thus power relations)" and "understanding of them so they can be challenged" (p. 9).

Hyland and Hamp-Lyons called for submissions addressing EAP's sociopolitical contexts, including power, to "fully understand what happens in institutions to make discourses the way they are" (p. 9). Their acknowledgment of the need for more careful theorizing and that "EAP instruction itself is not a politically neutral activity" (p. 9) demonstrate the impact that critical EAP had already made.

However, despite the editors' call for greater attention to power, three years later, Hamp-Lyons and Hyland conceded that, though there had been an increase in submissions with an explicit "social-theoretic stance" (2005, p. 3), power relations continued to be overlooked, for the most part. One explanation they offered was that critical EAP might be a "risky venture" (p. 3), perhaps due to the often hierarchical relationship between EAP instructors and their counterparts across the curriculum. That is, though the authors did not specify precisely what might be "risky" about a critical approach, they pointed to the following overlooked areas as legitimate sites of EAP investigation, all connected to power relations in an academic setting: "individual competitiveness, alliances among particular groups, the role of gatekeepers, and vested interests in institutional rewards systems" (p. 3). However, given EAP teachers' often subordinate status, it is perhaps not surprising that, despite the editors' urgings, power relations remained unexplored, for the most part, in submissions to *JEAP*. Instead, there were reports of small changes at the local level with little attention drawn to them.

The tension between encouraging critical EAP while acknowledging the possible risks for EAP teachers, often among the most vulnerable in terms of seniority and job security, demonstrates that criticality was in the air, though treated apprehensively even by mainstream EAP researchers in more senior positions. One example is Swales, Barks, Ostermann, and Simpson's (2001) report of a four-year study of MA architecture students' presentations of their designs, based on discourse and corpus linguistic analyses. Their research goals, captured in the title "Between critique and accommodation," included attention to both "the discourses of the M. Arch program" and "the larger social context in which these discourses are situated" (p. 442). Yet, in their conclusion, the authors discussed the limitations of critical EAP in bringing about large-scale institutional change:

While a quasi-critical concern about our students' wellbeing in a recognized "culture of suffering" can lead to certain kinds of negotiated modification with subject instructors (such as changes in the assignment profile), there are likely to remain broader decisions that remain beyond our influence. (Swales et al., 2001, p. 455)

The recognition that change may be incremental is not at odds with critical EAP, but, instead, consistent with a central tenet: reflexivity. That is, as I show in the next section, CEAP is scrupulous about avoiding grand claims of empowerment or radical transformation, recognizing that change is multifaceted, not easily achieved, and not even necessarily desired.

Journal of English for Academic Purposes Special issue on Critical EAP

JEAP's special issue on critical EAP exemplifies CEAP scholarship 16 years after "critical EAP" was first proposed. The five articles point to sustained interest in power and identities, as well as reflexivity and criticality, that is, openings for students to question the status quo so they might improve social conditions in and outside academic contexts. Uniting all the articles are the following healthy tensions, none of which is resolved, but,

instead, interrogated in a reflexive, rather than definitive, manner: Should EAP pedagogy be pragmatic or critical? Is the target situation fixed or malleable? Are the students unskilled novices or full-fledged participants in academia? Should EAP teachers act as go-betweens or change agents? Each author raises these questions related to power and identity, yet allows the tensions to remain unresolved.

For example, Appleby (2009) discussed conflicts between white female Australian teachers and their East Timorese EAP students' notions of what is acceptable in gendered arrangements. Rather than taking a definitive stance, however, the author kept open the question of whether the teachers should have accepted what appeared to them as gender inequality in the behavior and language of their students or, instead, challenged it. She left it to readers to decide whether challenging the status quo might have served as a dominating discourse imposing culturally specific notions of gender equality, or not.

Other articles discuss moment-by-moment decisions made by the authors in their interactions with students. These "micro-ethnographic level" (Cadman, 2005, p. 354) choices were guided by awareness of power relations and students' subject positions, without imposing any particular point of view. Instead, students were encouraged to choose between accepting and challenging the status quo. For example, Chun (2009) invited EAP students to depart from a textbook chapter on "emotional intelligence" by focusing on a cartoon accompanying the text. Students interrogated traditional gender roles implied by the cartoon, which led to a lively and challenging classroom discussion of the relationship between gender, emotions, and intelligence.

For her part, Grey (2009) invited EAP business students to document diversity, uncertainty, and contradiction in different communities. During class presentations of their photographs and essays, one group presented a hybrid image of a digitally composed face comprised of features from each member, a patchwork crossing gender and racial lines, thus challenging "hegemony and fixity" of identities (p. 131) and provoking a "political engagement with difference" (p. 127).

Phan Le Ha (2009), too, addressed complex identities and power relations in mentoring an Indonesian graduate student. Both struggled with tensions between accommodating and resisting academic English discourse conventions. Their ambivalence about academic English calls to mind Morgan's (2009) proposal for EAP teacher educators to aim for "possibilities rather than certainties" so that students and instructors might reconceptualize traditional "roles and responsibilities" (p. 87).

Conclusion

Whether critical EAP is a field, subfield, or inter-discipline is perhaps less important than its hybrid identity as a set of shared theoretical assumptions and a theoretical nudge to EAP, a reminder to take power and identities into account. By keeping alive the tensions between pragmatism and criticality, fixity and malleability, accommodation and resistance, and the status quo and change, critical EAP insists that EAP research, teaching, and learning are inextricably linked to power relations.

Critical Ethnography

STEVEN TALMY

Critical ethnography in applied linguistics is an explicitly political approach to the empirical investigation of local occasions of language learning and use, and their connections to issues of race, ethnicity, class, gender, sexuality, identity, and language politics. It is typified by its complementary commitments to

- *describing* discrimination, social inequality, marginalization, and oppression in the everyday life of institutional (e.g., school) cultures, subcultural groups or both;
- *working to transform* the conditions that allow these and other forms of injustice to persist; and
- *maintaining a critically reflexive stance* toward the relationships between researcher, the researched, and knowledge production, representation, and dissemination.

Like other forms of ethnography, critical ethnography adopts methods such as participant-observation, interviewing, and the collection and analysis of site artifacts, but it derives its theoretical influences, insights, and explanatory frameworks from critical social theories. In recent years, it has become an established approach to inquiry in applied linguistics, with studies that focus on issues such as racism, sexism, linguistic prejudice, homophobia, and identity politics both in and outside of the language classroom.

Contrasting Conventional and Critical Ethnography

In descriptive or conventional forms of ethnography, a primary aim is to investigate

people's behavior in naturally occurring, ongoing settings, with a focus on the cultural interpretation[s] of behavior . . . The ethnographer's goal is to provide a description and an interpretive-explanatory account of what people do in a setting . . . the outcome of their interactions, and the way they understand what they are doing. (Watson-Gegeo, 1988, p. 576)

Central principles of ethnographic research include a research focus on behavioral patterns of a cultural or subcultural group; holistic, contextual interpretation; and participant-relevant (or "emic") analysis, derived from prolonged and persistent engagement in the research field, ongoing data collection, requisite "thick description," and an emergent, recursive relationship between data, research questions, and interpretations (see, e.g., Lincoln & Guba, 1985; Erickson, 1986).

Critical ethnography shares these interests, but also departs from them in important ways. As May (1997) notes, critical ethnographers "reject the abrogation of a theoretical perspective for the 'open-ended' collection of data, [which is] characteristic of conventional ethnography," because all researchers necessarily "begin from a theoretical position," whether they acknowledge it or not (p. 198). Similarly, critical ethnographers dismiss the possibility of straightforward or "objective" description of sociocultural settings, since all description is inherently interpretive, and all interpretation is in some way ideological. In sum, critical ethnography "transforms" conventional ethnography by

2 CRITICAL ETHNOGRAPHY

supplying it with additional perspectives, principally historical and structural, that alter the ethnographic project toward one which supports an emancipatory as well as a hermeneutic concern . . . [T]his makes it a procedure with a pedagogical and political interest. (Simon & Dippo, 1986, p. 201)

The Critical Ethnographic Project

To define what is meant by “critical” is fraught with the potential for reductionism and inaccuracy. This is attributable not only to a dynamic plurality of critical social theories, but to ongoing, shifting relationships among them and postmodernism, poststructuralism, and postcolonialism. To arrive at a single definition would erroneously suggest a comfortable consensus among critical researchers, and “lead problematically toward solidify[ing] and disciplin[ing]” (Pennycook, 1994, p. 691) what is in fact a diverse and richly complex constellation of theories that work to transcend disciplinary borders, and that explicitly challenge the modernist impulse to simplify, categorize, and label.

Although there is no simple definition of “critical,” there are certain principles shared in the critical ethnographic “project” (Simon & Dippo, 1986). Talmy (2010, pp. 128–9) has summarized some of them as follows: a conception of society as marked by asymmetries in power; a focus on the mutual relationships between social structure and human agency; a processual conception of culture as an ongoing, politically contested site of struggle; acknowledgment of the sociohistorical situatedness of research; ongoing efforts to promote the transformation of inequality; a rejection of the notion of value-free research, which is replaced by critical ethnographers’ open acknowledgment of their own values (see Becker, 1967); and a reflexive recognition of how those values have shaped their scholarship.

Early Work in Critical Ethnography

According to Anderson (1989), critical ethnography grew

out of dissatisfaction with social accounts of “structures” like class, patriarchy, and racism in which real human actors never appear . . . [and] dissatisfaction with cultural accounts of human actors in which broad structural constraints like class, patriarchy, and racism never appear. (p. 249)

Contemporary forms of critical ethnography can be traced to the anthropology of education, the sociology of education, and cultural studies, for example, in the work of Basil Bernstein (e.g., 1975), Angela McRobbie (1978), and John Ogbu (e.g., 1974). Paul Willis’s (1977) study of “the lads,” 12 working-class boys who composed the “counter-school culture” of an English secondary school in the 1960s, is one of the best-known and most widely cited critical ethnographies of the era, and demonstrates well how ethnography can be used to empirically ground and amplify the critical ethnographic project. The lads rejected the middle-class values of the school by asserting their working-class identities in the form of “continuous guerrilla warfare” (p. 19) that took place both in and outside the classroom. The lads missed class, vandalized books, disrupted lessons, harassed teachers and conformist classmates (the “ear’oles”), and otherwise flouted school rules with an array of oppositional behaviors. Willis shows the rationale, or “counter-logic,” in the lads’ resistance by tracing it to their working-class roots. Their families, the shop floors where their fathers worked, the street life they knew, and the terms of their counter-school culture all pointed to a different ethos than the normative, domesticating, middle-class culture promoted at school.

Critical Ethnography in Applied Linguistics

Canagarajah (1993, 1999) is one of the first to have published a “politically motivated ethnography” (1993, p. 605) in the field. His research concerned an eight-month-long critical ethnography of 22 Tamil students in a Sri Lankan university second language (L2) English class. Despite professing to be highly motivated due to the social and economic advantages afforded English speakers in the country, these students increasingly displayed oppositional behaviors to the English course’s curriculum, textbook, and pedagogy. These behaviors included increasing absence from class; use of their first language (L1) when the L2 was called for; refusal to participate in pair/group activities, compelling more traditional teacher-regulated classroom participation structures; and defacing textbooks. This was the “underlife” of student opposition, a collaborative counterculture of coping strategies students deployed to oppose the “alien ideologies and cultural values of the textbook” (1999, p. 93). Canagarajah suggested that such a counterculture allowed students to appropriate what was communicated through the curriculum and reconstruct it in ways they preferred or believed were to their advantage.

Other critical ethnographies in the field have addressed a range of topics while still sounding similar themes, including the politics of (second) language education, power, learner agency, racism, linguistic prejudice, and other forms of discrimination. Ibrahim’s (1999) study considers how a group of continental African youth attending a Francophone high school in Canada “became Black,” that is, entered a “*social imaginary* . . . in which they [were] already constructed, imagined, and positioned . . . as Blacks” (p. 353). Motha (2006) uses data from interviews and afternoon teas to represent discussions she had with four teachers in their first year of teaching in public schools about challenges they indicated they were having with issues concerning race, identity, and the historical legacies of racialization, colonialism, and English-language teaching. Talmy (e.g., 2009) has used a critical discourse analytic framework to analyze social interaction in high school English as a second language (ESL) classrooms as a means to ground and elaborate claims from his critical ethnography concerning the widely noted, yet little investigated, “stigma” associated with the category of ESL in public schools. His investigation of social relations between long-term, “generation 1.5” ESL students (or “lifers”) and recent newcomers (or “FOBs”) connects instances in the micro politics of classroom interaction to matters of “macro” sociological significance, including assimilationism, xenophobia, and the valorization of “native speakers” of English.

Criticisms

Of the numerous criticisms that have been leveled at critical ethnography, two relevant critiques are addressed here: first, the emancipatory impulse of the “critical project,” which has been criticized by scholars generally sympathetic to the aims of critical research; and second, problems arising from the so-called imposition of critical values, which has been faulted by scholars who question “partisan” research.

Critical ethnography has been criticized for the paternalism implicit in its notions of emancipation and empowerment, its universalism and ahistoricity, and its failure to address the implications of rationalist assumptions (see, e.g., Ellsworth, 1989; Gore, 1992). This has led to calls for greater reflexivity and sensitivity to local complexity. Gore (1992) maintains that critical researchers “must be more humble and reflexive in our claims.” She maintains that rather than making grand pronouncements to research participants about “what we can do for you!” critical scholars “need to ask what *can* we do for you?,” the possibility existing that “we” may not be able to do anything for “you” at all. Here, “empowerment

is constructed as the *exercise of power in an attempt to help others to exercise power*” not “the *giving of power*” (p. 62, emphasis added).

In one of the more carefully argued and insightful discussions concerning the problems that arise from the so-called imposition of critical values, Hammersley (2000) maintains that critical scholarship “amount[s] to redefining the goal of enquiry as the promotion of some practical or political cause” (p. 156). Such a “redefinition” constitutes what he refers to as “wilful” or “motivated” bias (cf. “negligent bias”), which perverts both “the guiding principle of objectivity” in scholarly inquiry, and the pursuit of truth, “the only value that [should constitute] the goal of research” (p. 154). Critical scholars have responded to such arguments by contending that *all* research is political, not just that which aspires to be. They also note that it is ironic that because critical ethnographers go to great lengths to acknowledge their value orientations, they are susceptible to criticisms about the imposition of them, and by extension, the trustworthiness of their scholarship (see, e.g., Quantz, 1992).

Quality in Critical Ethnography

Because critical ethnography is “openly ideological” research (Lather, 1986), Anderson (1989) maintains that validity is the most serious methodological challenge facing critical ethnographers:

Critical ethnographers are in a double bind. They are often viewed with skepticism not only by the . . . research establishment, but also by fellow ethnographers who have taken care to build procedures for “objectivity” into their work . . . The apparent contradiction of . . . [openly ideological] research with traditional definitions of validity has left critical ethnography open to criticism from both within and outside of the ethnographic tradition. (p. 253)

The debate centers on whether or not conventional conceptions of validity, that is, those drawn from research conducted within a positivist paradigm, should or even can be applied to qualitative research, especially that which is openly ideological. If such conceptions are to be applied, there are epistemological, theoretical, and methodological incompatibilities; if they are not, then how is the “trustworthiness” (Lincoln & Guba, 1985) of critical ethnography to be ensured? Lather (1986) calls this being “between a rock and a soft place,” where the rock is “the unquestionable need for trustworthiness in data generated by alternative paradigms” and the soft place “is the positivist claim to neutrality and objectivity” (p. 65). She offers a reconceptualization of validity, one that recognizes that while research is never neutral (and thus that there is “no longer need [to] apologize for unabashedly ideological research”), data credibility checks are needed “to protect our research and theory constructions from our enthusiasms” (p. 67). Along with the more common techniques that are used in this endeavor, such as triangulation and reflexivity, she adds the notion of “catalytic validity,” which represents the degree to which the research initiates Freire’s conception of “conscientization,” or “the deepening of the attitude of awareness characteristic of all emergence” (Freire, 1993, p. 90), among research participants (and presumably, the researcher).

While Anderson (1989) agrees that quality in critical ethnography must be ensured through the use of systematic procedures (also see Carspecken, 1996), he warns that these procedures are valuable to the “extent that [they] provide the reader with a record of the decision-making process that produced the final analysis.” Claims to analytic objectivity that derive from methodological rigor work to mask “the creative act of researcher interpretation, [and] are attempts to fit ethnography into a positivist . . . framework” (Anderson, 1989, p. 252). Such attempts, it should be clear, are to be avoided.

The means that can be employed to ensure quality in critical ethnography can take several forms. First, data analysis should be ongoing and recursive throughout fieldwork, analysis, and writing, in order to check, modify, and refine emergent understandings throughout. This can be done by incorporating relevant negative instances in the data, and in the resultant search for alternative explanations. Data can also be triangulated using different methods (e.g., observation, audio/video recordings, documents, interviews) as well as different sources (e.g., different research participants). Critical reflexivity is also essential, particularly because the longitudinal requisites of critical ethnography may well result in researchers themselves becoming socialized into the cultures they are simultaneously immersed in and investigating. In this respect, occasional debriefing sessions with peers, advisers, and thesis committee members can be important. Member checks can also be used, in which research participants are consulted concerning emergent analyses. Discourse analysis of relevant social interactions and site artifacts can also be undertaken as a means for grounding, warranting, and elaborating claims (see Talmy, 2010). Finally, a key to high-quality critical ethnographic inquiry is prolonged and persistent engagement. This refers to frequent, repeated instances of site entry for fieldwork over periods spanning several months or years.

Conclusions

Critical ethnography remains comparatively underrepresented in qualitative research in applied linguistics. However, it is clear that this is changing. Recent scholarship has demonstrated that critical ethnography is particularly well suited for investigating topics of great relevance to the field; at the same time, this work has shown how the orientations provided through applied linguistics research can also benefit critical ethnography.

“Critical” in Critical Discourse Analysis

PAUL CHILTON

The term “critical” was adopted by a group of linguists working at the University of East Anglia, UK, in the 1970s to describe a type of applied linguistics that concerned itself with the relationship between language and social phenomena. Unlike the kind of sociolinguistics that was concerned with covariation between linguistic features and social variables such as geographical location, gender, generation, and social class, the “critical” approach was understood as making explicit social processes and structures about which judgments, in effect ethical judgments, could be made. This approach was called “critical linguistics” by its initiators, Roger Fowler, Bob Hodge and Gunther Kress (Fowler, Hodge, Kress, & Trew, 1979). Later developments came to be known as “critical discourse analysis” (CDA), a label especially associated with the work of Norman Fairclough (Fairclough, 1992, 2001; Fairclough & Wodak 1997), van Dijk (1993, 2008) and Ruth Wodak (1989, 1996, 2006). The label “critical discourse studies” (CDS) was preferred by van Dijk, while Wodak’s approach is called the “discourse historical approach” (Reisigl & Wodak, 2009).

Emergence of the Critical Approach

The critical approach to discourse can be seen less as a scientific development within linguistics than as a philosophical perspective with roots in Western philosophy. This fact gives rise to important problems within the contemporary globalized context. The word *critical* is associated with currents of thought whose recent sources are in the eighteenth-century European Enlightenment but whose roots are in ancient Greek philosophy. Etymologically, the verb “criticize” and its cognates derive from Greek *krinein* “to separate, decide,” in the sense of making a judgment or a distinction.

In the European philosophical tradition of the eighteenth century, “critique” or “criticism” implies not accepting arguments or states of affairs as given and unchangeable but analyzing them on the basis of rational judgment. Criticism in this sense is assumed to be value-free, except insofar as high value is given to rationality itself. More specifically, to be critical in the European Enlightenment could imply rejecting metaphysics, denouncing religion, and challenging political abuse. In the work of Immanuel Kant (1724–1804), “critique” (*Kritik*) has an antimetaphysical meaning to some degree, but not a primarily condemnatory meaning. Rather, “Kantian critique” has to do with the use of rational analysis to explore the bounds of concepts and theories, including the human use of reason itself and its relationship to the physical structure of the world. Later philosophers radically extended the reach of Kant’s notion of *Kritik*. Marx applied it to political economy. The Frankfurt School of Critical Theory in the 20th century, whose leading lights were Theodor Adorno (1903–69), Walter Benjamin (1892–1940), and Max Horkheimer (1895–1973), chose to include analysis of cultural and social phenomena of various kinds. Another philosophical development of the Kantian outlook is critical realism, the British version (e.g., Bhaskar’s 1989 work) being relevant to critical social science, although the term “critical realism” is used also in the philosophy of natural science and in theology. In the second half of the 20th century, this broad “critical” tendency produced “critical studies” of various kinds, the general aim of which was to expose the contingent artifactuality of

social and cultural forms such as gender and race. Work of this kind has established itself in sociology and also in economics, legal studies, international relations, and the history of science.

The critical study of language can be seen as arising in this tradition, as indeed was claimed by its early exponents (Fowler et al., 1979; Fowler, 1996). Among the "critical" academic disciplines in the West, critical discourse analysis has focused on language use and has sought to advance critical analysis by applying technical tools from linguistics.

The Term *Critical* in CDA

It is of course the case that the meanings of the word "critical" in English include non-technical meanings that might be glossed as "censorious" and in some contexts "denunciatory." It is arguable that there are two senses in English and European languages. The first and more specialized sense might be called "cognitive": to "criticize" is to engage in "critique," to engage in a rational conceptual activity. The second and everyday meaning is primarily interactive. In this sense, to "criticize" denotes an interactive social activity that somehow incorporates a normative or ethical standpoint. The verb "criticize" is thus a particular kind of speech act verb.

Within CDA, there are varied and sometimes vague understandings of terms such as "critical," "criticism," and "critique." This leads to at least two connected projects. First, critical analysis of discourse can mean to make the implicit explicit. More specifically, it means making explicit what is claimed to be an implicit relationship between discourse, power, and ideology. In societies where people, especially those in dominant or influential positions, tend to convey their propositions in a rather opaque manner, it is by being "critical" in this sense that one can "make more visible these opaque aspects of discourse" (Fairclough & Wodak, 1997, p. 258). And to be "critical" requires analysis: *Critical* is used in the special sense of aiming to show up connections which may be hidden from people—such as the connections between language, power, and ideology (Fairclough, 2001, p. 4).

Van Dijk has on numerous occasions stated that critical discourse studies should be engaged in the critique of social inequality and that

[t]he "critical" in CDS . . . presupposes a judgment of any social situation or practice that is illegitimate, specifically a discursive practice that constitutes an abuse of power and that confirms or results in social inequality or injustice. And combined with DA or DS the "critical" implies that it is a scholarly discourse/practice that is based on the systematic and explicit (theory based) analysis of such abusive discourse as an illegitimate practice in terms of a multidisciplinary discourse studies. (Personal communication; see also van Dijk 1993, 2008)

It is clear, as van Dijk is aware, that the notions of abuse, legitimacy, power, etc. require further explanation and definition. In principle, critical discourse studies, as distinct from discourse studies in general, produce theories and analysis that (also) formulate a reasoned judgment about the discursive practices, especially of those in power.

Second, being "critical" has a further implication, one that takes the application of linguistics beyond pure analysis and puts it to work in what is intended as the improvement of socially embedded discourse. It may be said that this follows from the view that all discourse is a form of action. Thus, critical analysis itself, since it also is a form of discourse (or rather "metadiscourse"), is a form of social action. For instance, Wodak and Reisigl (Wodak, 1996, 2006; Reisigl & Wodak 2001, 2009) are concerned with the application of the results of discourse analysis to communication problems in, for example, schools and hospitals, as well as to guidelines for nondiscriminatory language behavior.

Fairclough makes specific proposals for critical discourse analysts: working with activists in designing and carrying out research, linking it, for instance, to the campaigns of disabled people over welfare reform, seeking to publish pamphlets, articles in newspapers and magazines, or on the Web, and developing ways of writing which are accessible to many people without being superficial (Fairclough, 2001, pp. 264–65). The implication appears to be that critical discourse analysts have some obligation (a) to be politically committed, (b) to seek to apply practical results of analysis to communication problems, or (c) both of these activities combined. Kress (1996, p. 15) summarizes the critical project of CDA in terms of a political project.

Critical studies of language, critical linguistics (CL) and critical discourse analysis (CDA) have from the beginning had a political project: broadly speaking that of altering inequitable distributions of economic, cultural and political goods in contemporary societies. The intention has been to bring a system of excessive inequalities of power into crisis by uncovering its workings and its effects through the analysis of potent cultural objects—texts—and thereby to help in achieving a more equitable social order.

Reisigl and Wodak (2001, p. 34) are explicit about the ethical and human rights basis of their criticism:

an engaged social critique is nurtured ethically by a sense of justice based on the normative and universalist conviction of the unrestricted validity of human rights and by the awareness of suffering, which both takes sides *against* social discrimination, repression, domination, exclusion and exploitation and *for* emancipation, self-determination and social recognition.

These authors go even further in mentioning the model of deliberative democracy for their grounding of critique, drawing extensively on ideas from Jürgen Habermas (Habermas, 1971, 1979, 1984/1987, 1996). In this line of argument the political model of deliberative democracy is linked with a discourse ethics, Habermas's "universal pragmatics," which postulates specific ethical imperatives as universals underlying human communication.

It seems clear that critical analysis presupposes a normative judgment that in turn presupposes a values base; it is not simply a discovery procedure that will explicate hidden power abuse and inequalities. The question thus arises as to exactly what procedures are involved in critical analysis. Reisigl and Wodak (2009) address this question and propose a three-stage model that distinguishes text-immanent critique, sociodiagnostic critique, and prospective critique. Their view of *text-immanent critique* is not focused first and foremost on the linguistic description of texts. Rather it is based on hermeneutics (the study of possible meanings in texts) and pursues one of the early ideas of critical theory, namely, the unearthing of inherent contradictions by linguistic means. While *text-immanent critique* is claimed to be strictly text-oriented, *sociodiagnostic critique* is avowedly based on the analyst's social and political commitments. At this level, also, the aim is to reveal multiple interests and contradictions originating in the text producers, on the basis of the evidence of the text and its contexts. Utterances in a text, or the text as a whole, may belie or be belied by other utterances and texts. This is described by Reisigl and Wodak (2001) as a process of "demystifying." *Prospective critique* is said to be built on these two levels and to have the purpose of identifying areas of social concern that can be addressed by direct social and political engagement.

CDA is critical in two senses. First it seeks to reveal what is not self-evident through the analysis of societally contextualized and institutionalized language use. Second, it seeks to judge (given a certain set of values or a political ideal), and ultimately to correct or

improve, certain kinds of social structures and processes. Such considerations reveal the ambitious nature of the critical claims of CDA. The philosophical, and specifically ethical, exploration of such claims has scarcely begun.

Methodological, Theoretical, and Philosophical Issues

CDA scholars often say that their processes of analysis and critique should themselves be subject to critique. Serious criticisms have indeed been raised with respect to linguistic methodology and theory, both of which are related to CDA's notion of critique. I believe, however, that there are also more fundamental philosophical questions that have started to appear and that will doubtless be addressed by new generations of scholars in the international scholarly community.

The Problem of Objectivity

A serious objection against CDA arises precisely from the normative assumptions underlying the critical stance. The presence of value judgments is likely to disturb those linguists who take seriously the claim of linguistics, pure or applied, to scientific objectivity. Widdowson (2004), for example, raises objections against CDA, not so much because he lacks sympathy with CDA's ethical or political stance, or because he thinks certain kinds of language use in the public domain should not be criticized, but because he considers CDA's methodology to be flawed. According to Widdowson critical discourse analysts select small data sets and selectively analyze linguistic features in a way that merely confirms their own values. Similar kinds of objection to the CDA paradigm have been made by Stubbs (1997) and Schegloff (1997). CDA scholars have replied that they do in fact acknowledge their normative position. In itself this reply does not remove the charge of subjectivity but takes the argument into a further discussion concerning the very possibility of scientific objectivity, in which reference is often made to Kuhn (1962) on the shift of scientific paradigms and Habermas on science, normativity, knowledge and interests (Habermas, 1968, 1971).

In response to the problem of the size of data sets, some researchers respond that CDA work has now begun to examine very large amounts of data using the expanding techniques of corpus linguistics (see Baker, 2006; Baker et al., 2008). Selection bias can be addressed by using standard statistical sampling techniques. Furthermore, it is also sometimes claimed that subjective bias can be eliminated or reduced with the assistance of text analysis programs.

The problem here, however, is that meanings and interpretations cannot be found this way, even if programs claiming to identify semantic fields are employed. Given a statistically selected data set, and given statistically significant lexical, grammatical, and semantic patterns, the critical discourse analyst still wants to investigate first context-sensitive pragmatic meaning and second the social significance of these findings. There is likely to be no objective method for these two interpretative stages.

The Problem of Criticizing Language

While the critique with which CDA is concerned is the critique of discourse, CDA work frequently states that it understands discourse as the use of language; certainly, the writers referred to in this article offer analyses of language using various tools of linguistic description. In addition to the methodological objections already mentioned there are several objections relating to linguistic theory that CDA work lays itself open to.

One fundamental issue concerns the question of what it is exactly that is under critical analysis. The English term *language* is notoriously ambiguous. It can refer to the human language ability, to a language such as Tzeltal or Mandarin, or to language-in-use in

everyday communication. Some authors associated with CDA give the impression that it is a language *as such*, that is its grammatical structures and lexicon, even its writing system, that is under critique. This tendency is apparent in Hodge and Kress (1993) with regard to English and in more extreme form in Hodge and Louie (1998) with regard to Mandarin. Such approaches may suggest that the structures of a particular language (or at least some of them) are in themselves ideologically motivated, rather than simply particular *uses* of a particular language. While it is the case that some languages may reflect particular social structures in some grammatical patterns (a well-known example might be gender honorifics in Japanese, for example), and the same may be said of a language's lexicon, it is unwarranted to make large generalizations to the effect that a language's grammatical structures can be ideologically motivated. This is not to say that the conventional *uses* of the grammatical and lexical systems of a language are not closely related to social structures and are manifest in numerous ways, including the dynamics of genres.

There is a related and frequently found variant of this approach, which focuses on particular grammatical structure and makes general claims about their ideological function. For example, it has been asserted that "transformations always involve suppression and distortion" (Hodge & Kress 1993, p. 35), with particular reference to passive constructions and nominalizations. Both these constructions have attracted much critical attention and the distinction between a syntactic or morphological phenomenon and its use in interactive contexts has not always been drawn when critical interpretation is presented. Even when nominalizations are being treated not as an abstract grammatical construction but as an actually attested in-use instance, and even when they have been correctly identified as nominalizations, the claim that they are mystificatory in context is generally extremely difficult to uphold (on nominalizations see Fairclough, 1992; see also the special issue of *Discourse & Society*, 2008).

Two Kinds of Philosophical Problem

As will have already become apparent, one of the problems of formulating a theory of discourse analysis is the risk of circularity, something that is not at issue for ordinary discourse analysis, in which there is not critical intent (except in a quasi-Kantian sense of making conscious the structures of human discourse). There would be no problem, if as is sometimes thought, linguistic analysis infallibly reveals abuse of power and the like. But it is difficult to see how this can be the case, for one would have to be able to specify exactly which linguistic structures will predict such abuse, and there is no evidence that this can be done. The alternative is as follows: the analyst first reads and generates an overall impression (i.e., the meaning of the text) that it is related to power structures of which they disapprove, and subsequently proceeds to identify linguistic structures in the text that they claim give rise to that overall impression (i.e., the meaning of the text). This alternative leads to the charge of circularity and subjectivity. Put like this, the problem resembles what is known as the hermeneutic circle in, for example, the philosophy of Heidegger. There is a dilemma here that remains for a full theory of CDA to resolve.

A philosophical problem of a different order is revealed by the fact that CDA now finds itself in a global environment. CDA has already crossed geopolitical and cultural frontiers. In view of what we have seen above concerning the origins of the critical stance in the European Enlightenment, the presupposing of an ethical and/or political base of critique in CDA, this fact raises important questions. Given its avowed aims and interests, it is difficult for CDA to ignore them. When CDA is translated into languages other than European ones and received in non-Western societies, how is the critical element understood? Is the critical element separable, leaving a kind of qualitative sociolinguistics that is treated as a method for investigating the integrated relationships between language, social action, and social structures? If the critical element is understood as integral to the

descriptive analysis, then a question arises as to the normative base that grounds critique. There is the logical possibility that *any* value system could serve as the basis for critique. Thus for example, some scholar in some society may believe that social inequality and differential power structures are desirable. Can CDA be used to critique discourse which upholds and promotes *inequality*? Or are the values presupposed by Western practitioners of CDA somehow intrinsic to the analysis? This case has not yet been philosophically made by CDA theorists. This hypothetical example brings out the inevitability for CDA of specifying the values that ground its critical element. Once admitted, however, this point leads to noticing the inevitability of justifying those grounds, in particular in a globalized context where value systems may not be universal. It is thus conceivable that critical discourse analysts, in different societies, for whom different values provide the premise for critical argument, may be obliged to enter a kind of justificatory dialogue that is essentially different from the pursuit of critical analysis that takes its grounds for granted.

Critical Literacy

HILARY JANKS

Introduction

Critical literacy is a sociocultural orientation to literacy that takes seriously the relationship between meaning making and power. Text producers choose the mode and the medium of their communication and the messages they create are constructed by the specific choices they make of language, words, images, gestures, sounds, layout, and design. In order to illustrate how texts may be read critically, this entry will analyze the titles and covers of key books in the field. This rhetorical strategy enables two moves. First, it provides a means of introducing the history of the field, and second, it turns critical literacy on itself to enact its principles of textual interrogation.

In producing texts, speakers and writers have to make lexical, grammatical, and syntactic choices. In making lexical choices they have to decide on the exact vocabulary to use; in making grammatical choices they have to choose, for example, between present and past tense, tense and modality, active and passive voice, singular and plural, and first, second or third person; in making syntactic choices they have to decide on the order of their words and the sequence of their clauses. Different choices produce different texts with different meanings and different effects. Text producers who are critical make choices that are principled and ethical. Critical readers are alert to the interests at play in texts and are concerned with questions of who benefits and who is disadvantaged.

In multimodal texts a range of sign systems are used to convey meaning: visual, verbal, audio, gestural, spatial. In each of these sign systems producers have to choose from a range of possible options. In the visual mode alone there is a range of media—photography, drawing, and videography, among others—and within each of these a range of possibilities. So, for example, in photography, there are different shots: close-up, medium, and long—different ways of framing and cropping, different kinds of focus, and so on. Choices of which sign to use are called semiotic choices and they entail decisions about both selection and combination. Halliday (1985) refers to language as “meaning potential”; how meaning is realized depends on the choices that are made. The same can be said of all sign systems.

The choices made in the construction of texts reflect the positions of their text makers—where they stand in relation to the ideas as well as how committed they are to their point of view. These choices also work to position readers. In addition to understanding *what* texts mean, critical readers also have to be conscious of *how* texts mean; how texts are positioned by their writers and *how* texts work to position their readers. Readers also have to ask whose interests are served by this positioning in order to understand how power works in and through texts to produce particular social effects.

To make matters more complicated, it is important to realize that the choices made by text producers are not always conscious. Meaning makers take on the naturalized ways of speaking, writing, and designing that are available to them in their discourse communities without always realizing that these include taken-for-granted ways of doing, being, valuing, and believing (Gee, 1990). Because these discourses produce us as speaking subjects (Foucault, 1984), critical writers and designers have to be able to examine their own texts in order to understand the interests at work, and they need to acquire sufficient

2 CRITICAL LITERACY

facility with signs to enable them to control their textual stance. Because meaning making can be used for good or ill, a critical literacy perspective needs to be underpinned by an ethical commitment to equity and social justice.

Verbal Mode

Some of these ideas can be illustrated with an analysis of the titles of 15 books in the field of critical literacy that have contributed to its establishment and development. This is a highly selective list of books relating to critical literacy which in addition excludes related work, such as that by feminist or post-colonial writers, that has underpinned critical literacy. Because spatial constraints have resulted in a list that is not comprehensive, the discussion of patterns and their implications is meant to be illustrative, not definitive:

1. *Pedagogy of the Oppressed* (Freire, 1972);
2. *Language and Control* (Fowler, Hodge, Kress, & Trew, 1979);
3. *Ways with Words* (Heath, 1983);
4. *Literacy in Theory and Practice* (Street, 1984);
5. *Literacy: Reading the Word and the World* (Freire & Macedo, 1987);
6. *Language and Power* (Fairclough, 1989);
7. *Social Linguistics and Literacies: Ideologies in Discourse* (Gee, 1990);
8. *Reading Images* (Kress & van Leeuwen, 1990);
9. *Critical Language Awareness* (Fairclough, 1992);
11. *The Politics of Writing* (Clark & Ivanič, 1997);
11. *Constructing Critical Literacies: Teaching and Learning Textual Practice* (Muspratt, Luke, & Freebody, 1997);
12. *Situated Literacies: Reading and Writing in Context* (Barton, Hamilton, & Ivanič, 2000);
13. *Multiliteracies* (Cope & Kalantzis, 2000);
14. *Negotiating Critical Literacies in Classrooms* (Comber & Simpson, 2001); and
15. *Multimodal Discourse: The Modes and Media of Contemporary Communication* (Kress & van Leeuwen, 2001).

The titles have been listed chronologically and give a sense of developments in the field. Each of these books is positioned differently by the choice of words for the title. Only three use the word *critical* in conjunction with *literacy*. Only five signal the importance of power in this domain by the choice of the words *power*, *politics*, *control*, *ideologies*, or *oppressed*. Six suggest that the focus is on *language*, *linguistics*, or *word(s)*. Nine in this set refer specifically to literacy, with five signaling a shift in the way of thinking about literacy by selecting the plural form of this noun. Two work with literacy as reading, writing, or both, while three suggest that literacy includes an ability to read images and other multimodal signs, which results in the shift from print literacy to multiliteracies. Eight titles present literacy as a socially situated practice (with words such as *social*, *situated*, *in classrooms* or *in contexts*, *reading the . . . world*, *contemporary*, *ways*, and *practice*). Two suggest that critical literacy is an active, ongoing process through the use of the present participles *negotiating* and *constructing*. Three of the titles relate critical literacy to education with the words *pedagogy*, *teaching and learning*, and *classrooms*. These ideas are summarized in Table 1.

Development of the Field of Critical Literacy

The words chosen give a sense of how the writers and their publishers have decided to position each book's contribution to the field, but they also reflect the history and develop-

Table 1 Ideas foregrounded in the titles of key books pertaining to critical literacy

Markers	Titles and choice of markers
Critical (3)	<i>Critical Language Awareness; Constructing <u>Critical</u> Literacies: Teaching and Learning Textual Practice; Negotiating <u>Critical</u> Literacies in Classrooms</i>
Power (5)	<i>Pedagogy of the <u>Oppressed</u>; Language and <u>Control</u>; Language and <u>Power</u>; Social Linguistics and Literacy: <u>Ideologies</u> in Discourse; The <u>Politics</u> of Writing</i>
Language (6)	<i><u>Language</u> and Control; Ways with <u>Words</u>; Literacy: Reading the <u>Word</u> and the World; <u>Language</u> and Power; Social <u>Linguistics</u> and Literacies; Critical <u>Language</u> Awareness</i>
Literacy (9)	<i><u>Literacy</u> in Theory and Practice; <u>Literacy</u>: Reading the Word and the World; Social Linguistics and <u>Literacies</u>; <u>Reading</u> Images; The Politics of <u>Writing</u>; Constructing Critical <u>Literacies</u>; Situated <u>Literacies</u>: <u>Reading</u> and <u>Writing</u> in Context; <u>Multiliteracies</u>; Negotiating Critical <u>Literacies</u></i>
Multimodality (3)	<i>Reading <u>Images</u>; <u>Multiliteracies</u>; <u>Multimodal</u> Discourse: The Modes and Media of Contemporary Communication</i>
Socially situated practice (8)	<i>Pedagogy of the <u>Oppressed</u>; <u>Ways</u> with Words; Literacy in Theory and <u>Practice</u>; Literacy: Reading the Word and the <u>World</u>; <u>Social</u> Linguistics and Literacies; Constructing Critical Literacies: Teaching and Learning Textual <u>Practice</u>; <u>Situated</u> Literacies: Reading and Writing <u>in Context</u>; Negotiating Critical Literacies <u>in Classrooms</u></i>
Ongoing process(2)	<i><u>Constructing</u> Critical Literacies; <u>Negotiating</u> Critical Literacies in Classrooms</i>
Education(3)	<i><u>Pedagogy</u> of the Oppressed; Constructing Critical Literacies: <u>Teaching</u> and <u>Learning</u> Textual Practice; Negotiating Critical Literacies in <u>Classrooms</u></i>

ment of the field, and the social conditions which governed their selection at the time. For example, what critical literacy means had to be established before it could be used meaningfully in a book title. To this day, the different meanings of the word “critical” create ambiguity. In one sense *critical* refers to a form of reasoning based on evidence and argument; in another to a Marxist analysis of social power. To avoid confusion with critical thinking and to include other theories of power based on the work of Bourdieu (1991) and Foucault (1984), writers often avoid the word *critical* in their titles. It is important to understand that signs have to be read in relation to the processes and conditions of their production and reception (Fairclough, 1989).

Knowledge of the field enables a reader to locate the different titles in the different strands of work that influenced the development of critical literacy. The term “critical literacy” originates with Freire (1972), who was teaching adults in Brazil to become literate. At the time his main focus was on developing what came to be known as critical pedagogy, an approach capable of producing human beings capable of acting in and on the world (Freire & Macedo, 1987). He set out to create problem solvers able to take social action to improve the social conditions of their lives, and he was the first to link reading the word to reading the world. Although tied to developments in critical pedagogy, critical literacy, which was taken up largely in Australia, focused at first on critical reading as a form of social action and transformation (Muspratt et al., 1997; Luke, 2000; Comber & Simpson, 2001).

Literacy was also the focus of the work of anthropologists such as Heath (1983) and Street (1984), who studied literacy as a set of practices in a range of communities by observing literacy events. Their ethnographic work was extended into what became known

as the new literacy studies (Barton et al., 2000). This work shows whose practices enter the mainstream and become institutionalized and whose remain peripheral.

In the UK, work in East Anglia focused more on linguistics, and the term “critical linguistics” was coined by Fowler et al. (1979) in *Language and Control*. This was picked up in the work of the Lancaster circle on critical language awareness (Clark, Fairclough, Ivanič, & Martin-Jones, 1987; Fairclough, 1992) and critical discourse analysis (Fairclough, 1989). Linguists choose to use Halliday’s systemic functional grammar (1985) because of the way in which it works with meaning. Gee (1990), a linguist working in the USA within a Bourdieuean framework, develops a sociocultural understanding of discourse and method of discourse analysis borrowing also from cognitive linguistics. Alistair Pennycook (2001) provides an overview of a range of approaches to critical linguistics and an orientation toward second language teaching.

Halliday’s grammar forms the basis of Kress and van Leeuwen’s (1990) work on *Reading Images*, which led to work on both multimodality and multiliteracies. That texts are becoming increasingly multimodal is nowhere more apparent than in online texts and the move from page to screen. The shift to add critical writing to critical reading was made by the work of Clark and Ivanič (1997; Ivanič, 1998) and extended to include design and redesign in the work of the New London Group on multiliteracies (Cope & Kalantzis, 2000).

For the analysis of these titles to be considered critical, a discussion of the interests at play in the field as reflected in them is needed. Freire’s title is the only overtly political one, with its focus on education for the liberation of an oppressed class in Brazil. His work with adults was seen as subversive and he was forced to leave Brazil. In addition, his books were banned there and in other parts of the world. Of the authors in this partial list who are women, only two—Heath (1983) and Ivanič (1998)—have written monographs that have shaped the field. An analysis of critical discourse research shows the gendered nature of this field, in which men produce the theory and women apply it to practice (Norton, 1997). In the social sciences, different orientations compete with one another and intellectuals carve out a piece of the territory for themselves. The different strands contributing to critical literacy reflect these internal struggles within the field.

The Visual Mode

Kress’s work focuses on the different affordances of different modes of communication. The visual and verbal modes enable different representations of meaning. This is easily illustrated with the use of different covers for the same book. A striking example is the difference between the hardback and softback editions of Janks’s (2010) book *Literacy and Power* (see Figure 1). (Colored versions of these images may be viewed at <http://hilaryjanksprofessional.blogspot.com/search/label/Publications>.) Words alone simply do not create the same impact as a carefully selected visual image. When verbal and visual messages work in combination, the verbal is often used to anchor the meaning of the image. On the softback cover, the two work in combination with the image, acting as a visual metaphor for the title.

Both covers include the book’s title in white and the name of the author. Everything else is different. The hardback cover uses a standard, plain format typical of academic texts. Its austerity suggests that it will be read by discerning people who, from the title and the name of the author alone, will know whether or not the book merits their attention. The sans serif font has a clean, modern look, the deep blue background lends dignity to the project, and the overall uncluttered design suggests that this is serious reading. Without any visual or verbal enticements it also makes the book look like dull work, an effort rather than a pleasure to read. This particular format is used by Routledge for its research titles and is intended for purchase by libraries.

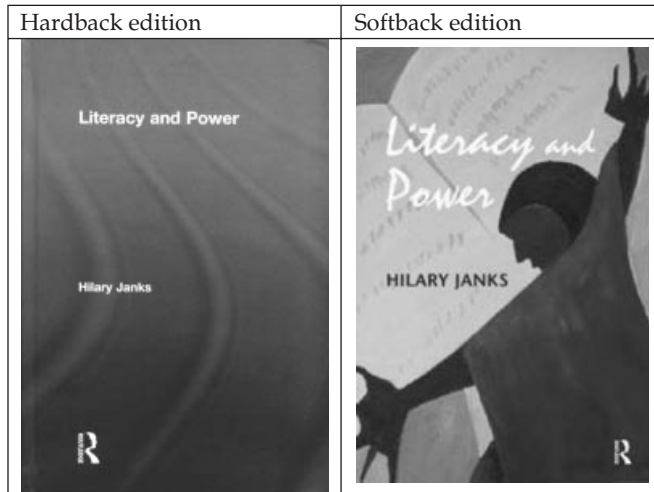

Figure 1 Comparison of hardback and softback covers of the same book © 2010 Routledge

The softback cover has a completely different and unique cover design. Using the genre developed for trade paperbacks, a strong, full-color painting takes up the whole of the front space, with the writing superimposed onto it. The use of contrasting colors is dramatic and demands the viewer's attention. The image of a large book held aloft by a powerful and imposing figure with outstretched arms serves as a metaphor for the title. The choice of an informal cursive font, suggestive of handwriting, is unusual for an academic text, and the use of block capitals makes the author's name stand out. A vector that divides the image along a diagonal from the top left corner to the bottom right corner is created by the line that separates the pages of the book in the picture, and it draws the eye to the Routledge logo. The horizontal lines used for the words of the title and author's name become salient because they cut across the diagonal. Overall the strong design makes one notice the cover.

In addition, the cover genre for popular books requires a blurb that explains what the book is about as well as recommendations from well-known experts in the field. This appears on the back cover and entices the reader with questions such as: "Do texts have designs on us and what can we do about it? What is 'linguistic capital' and who has it? How is literacy implicated in relations of power and questions of identity in our daily lives?" To knowledgeable readers, questions like these promise that the book will deal with key debates in the field, but they also invite a nonspecialist audience to consider the book.

Given that the hard and soft covers are for the same book, it is true that one should not judge a book by its cover. This, however, is a naive view because a cover affects readers' disposition toward a book, and in an age in which the visual increasingly carries meaning, the designs of covers are part of a book's meaning.

The Significance of Critical Literacy

Critical literacy is an overall stance toward spoken, written, and multimodal texts that requires a commitment to equity and social justice. It provides strategies for interrogating the word and the world, with the addition more recently of methods for analyzing multimodal texts. Texts are shaped by the discursive resources available to text makers and by

the ways of combining “saying (writing)-doing-being-believing and valuing” (Gee, 1990, p. 142) in the discourse communities that they inhabit. Gee’s argument is that these discourses produce our identities, providing us with our durable and embodied dispositions (Bourdieu, 1991).

Language is not a neutral means for communication. According to the report of the Truth and Reconciliation Commission in South Africa, which examined the role played by language in crimes against humanity during the anti-apartheid struggle:

Language, discourse and rhetoric *does* things: it constructs social categories, it gives orders, it persuades us, it justifies, explains, gives reasons, excuses. It constructs reality. It moves certain people against other people . . . Language, in its many and varied forms, is the central element in ideology as power . . . In the South African context it is important to understand how multiple discourses combined, intersected and intertwined to create climates of violence. In this respect, the ideologies of racism, patriarchy, religions, capitalism, apartheid and militarism all intertwined to ‘manufacture’ people capable of violence. (Truth and Reconciliation Commission, 1998, pp. 294, 296–7)

In a world riven by xenophobia, discourses that construct others as different and dangerous continue to produce fear and violence. The Bush years in the USA are a case in point. It is important to understand how discourse works and why it is, according to Foucault, “the power which is to be seized” (Foucault, 1984, p. 110). Because texts are the instantiations of discourse, much of the work of critical discourse analysis and critical language awareness focuses on the analysis of texts. The analysis of titles and covers in relation to the interests in play is an example of this kind of work.

Other work in critical literacy is more directly related to that of Freire. Here educators assist students to identify problems that affect their lives and to take considered action. “To exist, humanly, is to *name* the world, to change it. Once named, the world in its turn reappears to its namers as a problem and requires of them a *new naming*. Men are not built in silence, but in word, in work, in action-reflection” (1972, p. 61). This approach is epitomized in the work of educators such as Marg Wells in Australia and Vivienne Vasquez in Canada. Both are early childhood educators who help young children to identify and name their concerns and to take appropriate action to address them. Marg Wells’s students were able to identify the absence of trees in their poor neighborhood as an issue to be taken up with the town council (Comber, Thomson, & Wells, 2001). Vasquez’s children were upset that one of their peers was unable to eat at a school function because there was no food for vegetarians. The children addressed this with the organizing committee and with other schools in their neighborhood. Having named the problem, they wrote letters and petitions, did research, and wrote reports to support their arguments (Vasquez, 2004). They learnt to use literacy to effect meaningful change: what Freire refers to as a “new naming.”

New literacy studies is able to show how society privileges the literacy practices of dominant classes and creates the conditions of failure for people whose languages and literacies are constructed as “nonstandard.” Work on students’ out-of-school literacies is providing ways of bringing students’ diverse funds of knowledge (Gonzalez, Moll, & Amanti, 2005) into the classroom so as to use difference as a resource for learning. The work of Kress et al. (2005) on multimodality in teaching demonstrates powerfully how an analysis of the different modes of communication in English classrooms interact to produce the messages that students receive.

Because language and other forms of semiosis (meaning making) shape the social and are shaped by the social contexts of their use, developments in critical literacy are affected by changes in the sociohistorical and political context. For example, Al Gore’s powerful

multimodal presentation *An Inconvenient Truth* (2006) shows that it a text can change the conditions of possibility for discourses pertaining to the sustainability of the planet. Here reading the word and reading the world come together in ways that Freire (1972) could not have predicted. We are all going to have to read our practices of consumption and waste critically, in order to change them. Different moments of history require different discourses, different rhetoric, and different abilities to read the world into the word. Barack Obama's US presidential election campaign reminded us of the power of a carefully crafted speech delivered by a forceful orator.

Critical literacy is also affected by changes in technology. Information is now available to anyone who has access to the Internet at a touch of a button. This is a democratic medium where everyone has the power to produce and disseminate ideas. More and more information arrives unasked for through wireless technologies. Who has access to new digital literacies and what they do with them is going to become an increasingly important question. What is needed is a critically literate population of readers, writers, and viewers who are able to judge the quality of information and arguments as well as the likely effects of texts.

The Future of Critical Literacy

We know that new technologies affect the texts we produce and the signs that we use. We know that information can be Twittered instantly and that technologies can be harnessed for good or ill. We know that we read and absorb information differently when we read by scrolling on screen and flitting from hypertext to hypertext as opposed to the more linear reading of print texts. We know that new multimodal forms of communication require both new languages and literacies and that these in turn require new critical literacies. And we know that the exponential rate of change will place demands on our ability to read, write, and design with a critically literate stance and a social conscience. What we do not know is exactly what forms of design and analysis the future holds or which forms of power will draw the critical literacy gaze.

Critical Media Literacy

GUY MERCHANT

Media of various kinds play an increasingly important role in our everyday lives. With recent technological developments their reach has become ubiquitous and global. Particularly in affluent economies, where digital media are so pervasive that they are present in our experience from birth to old age, engagement with the material and social world is increasingly filtered through the technologies we use. Through personal communication devices, screen-based entertainment, educational resources, and so much more, a broad segment of our informational and relational lives are now technologically mediated. As a result, some commentators suggest that this has profoundly influenced who we are and how we see ourselves. So, for example, Gergen (1996, p. 131) argues that “in every way we become increasingly engaged in a world with others—a socially saturated world.” But although these changes in individual and social experience have become central to recent debates in *new literacies*, understanding the role of media in our lives has a longer history, reaching back at least as far as the work of the Frankfurt School in the interwar years (see below). It has repeatedly been argued that, because of the growing significance of media in everyday life, it is important that educators should work with children and young people to develop a critical understanding of the media environment. Innovation and development work of this kind, often classified as “media education” or “media studies,” has taken place at all levels of the education system. As a subject, media studies has used perspectives from social and cultural studies, literary theory, and communication studies in the analysis of media texts and the social practices and contexts in which they are located. These texts include mass media, such as television, cinema, and newspapers; person-to-person media, such as cell phones and music players; and niche media, such as fanzines and specialist websites.

The term *media literacy* has recently been adopted to describe “the ability to access, understand and create communications in a variety of contexts” (OfCom, 2004). This suggests a set of competencies that are prerequisites for membership and participation in a media-rich social world and are therefore presumably already developing in the early years (Marsh, Brooks, Hughes, Ritchie, & Roberts, 2005). But why should these competencies be described as *literacy*? The impetus for this comes from two sources—first, from the ways in which traditional definitions of literacy have been challenged (e.g., the New London Group, 1997), and second, from a need to secure a place for media work in curriculum planning and delivery.

Traditional conceptions of literacy are united by a concern for meaning-making with the written word through the practice of reading and writing, and are often associated with handwritten and print text. The rapid rise of digital communication has unsettled these associations and has led some to suggest that, because texts such as websites regularly combine image and sound with writing, it has become increasingly difficult to anchor definitions of literate meaning-making to the written word (Merchant, 2007). Consequently some uses of the terms *new literacies* and *digital literacies* focus on more holistic and wide-ranging conceptions of meaning-making (Lankshear & Knobel, 2006), and so it becomes quite appropriate, by extension, to redefine the study of media as a concern for developing “media literacy.” Furthermore, the project of media education may well be enriched

2 CRITICAL MEDIA LITERACY

through an alignment with some influential theoretical and analytical perspectives that have developed out of the study of print literacy. Among these is the conceptualization of literacy as a social practice (Street, 1984), analyses of the nature of text and reader response (Eco, 1979), and the aspirational claims of some of those working in the field of *new literacies* (e.g., Gee, 2003). In addition, as Livingstone (2008, p. 59) observes, there is a “long and proud history of theorising emancipatory knowledge in terms of the democratisation of literacy.”

But there is also a more pragmatic reason for adopting the term literacy. Given the repeated emphasis on the importance of literacy in the compulsory school curriculum, fueled by the back-to-basics movement in countries like the UK, Australia, and the USA, redefining media study as a kind of literacy may well help to secure its place within the curriculum. Indeed, there are some early indications of how this may play out. For example, in recent curricular guidance in England references made to the study of text include the use of different media, the importance of multimodality, and the use of new technology for meaning-making—all under the banner of literacy. But this begs the question of whether the use of media in such contexts is in itself media literacy, or indeed sufficient to be described as *critical media literacy*.

A variety of educators have stressed the importance of the critical dimension (e.g., Giroux, 1994; Luke, 1997; Alverman & Hagood, 2000; Buckingham, 2003; Kellner & Share, 2007), and their various interpretations of what should constitute “the critical” are informed by different schools of thought. The traditional cultural studies perspective, with its roots in the work of the Frankfurt School, argues that the culture industry is a powerful force in reproducing dominant ideologies and is essentially a sophisticated instrument of social control. Critical media literacy from this perspective is an act of resistance, or at least an inoculation against media domination. Over recent years, a more nuanced understanding of the relationships between media, audiences, information, and power has emerged out of this work. So, for example, by fusing elements of critical pedagogy with cultural studies, Kellner and Share (2007, p. 65) identify five basic themes or practices. These are (a) understanding media as the result of a process of social construction; (b) analyzing the codes and conventions through which media texts communicate; (c) recognizing how audiences negotiate meanings; (d) exploring the relationships between representation, and ideology and power; and (e) examining the role of producers and the media industry. Furthermore, the work of Giroux and his collaborators has consistently argued for a critical pedagogy that might reclaim public education and cultural policy from media corporations (Giroux, 1994; Giroux & McLaren, 1994; Giroux & Pollock, 2010).

Buckingham (2003), in his exploration of media literacy, arrives at a similar list of themes to those outlined by Kellner and Share (2007), but in doing so, introduces some useful reflections on how the concept of criticality has been operationalized in educational contexts. Amongst these is the observation that much early practice in media studies focused on “uncovering” the ideology of media texts, with the teacher in the position of providing the “correct” reading. In the extreme, according to Buckingham, this has had a tendency to silence personal response, to deny the possibility of multiple readings, and generally ignores or denies the pleasure that children and young people may derive from their everyday uses of media. The critique leads Buckingham to emphasize the importance of production in media literacy, suggesting that: “Much of the value of practical work lies in the fact that it allows students to explore their affective and subjective investments in media, in a way which is more difficult to achieve through critical analysis” (2003, p. 137).

This emphasis on the relationship between production and consumption seems particularly relevant when new social media and Web 2.0 technologies are considered (Davies & Merchant, 2009). The rapid rise of person-to-person messaging, online social networking, and content-sharing challenges established distinctions between producers and audiences.

In fact, some argue that the boundaries have become blurred to the extent that new practices of “produsage” emerge (Bruns, 2008), in which consumption involves production and is, in some senses, inseparable from it. Perhaps this is best illustrated through the example of photo-sharing sites such as Flickr, in which full participation depends as much on producing content as it does on viewing and commenting on the work of others (Merchant, 2009). Web 2.0 enthusiasts have seized upon these ideas, suggesting that they herald the emergence of a new cultural logic driven by a communitarian ethos (e.g., Lessig, 2002; Leadbeater, 2009). Whilst there is plenty of evidence of new kinds of participation and the development of new media forms, it is all too easy to overlook the fact that Web 2.0 services themselves are produced, owned, and designed—often as commercial ventures. As the involvement of children and youth in participatory media continues to increase—for instance, “73% of wired American teens now use social networking websites” (Lenhart, Purcell, Smith, & Zickuhr, 2010, p. 4)—the rationale for developing critical media literacy grows in strength.

In his writing on media, Jenkins regularly uses the term “participatory culture” to capture these recent trends, frequently suggesting the importance of audience engagement and collective intelligence in the development of popular media (e.g., Jenkins, 2006a). In an influential occasional paper written for the MacArthur Foundation—often referred to as the White Paper—a participatory culture is described as one in which members “believe their contributions matter, and feel some degree of social connection with one another” (Jenkins, 2006b, p. 3). It is argued that new communications technology has transformed the lives of many (but not all), and that new media skills are necessary for full participation in the digital world. Because of what is referred to as “the participation gap” these skills should, according to the White Paper, be incorporated in the school curriculum. Jenkins and his colleagues identify three problems:

How do we ensure that every child has access to the skills and experiences needed to become a full participant in the social, cultural, economic and political future of our society?

How do we ensure that every child has the ability to articulate his or her understanding of the way that media shapes perceptions of the world?

How do we ensure that every child has been socialized into the emerging ethical standards that will shape their practices as media makers and participants within online communities? (2006b, p. 18)

The authors recognize the centrality of media in the lives of children and young people whilst identifying the role that schools, after-school clubs, and parents play in the “learning ecology” (Barron, 2006, p. 195). These contexts all have a contribution to make to the “core media literacy skills” identified in the report. The skills themselves constitute a somewhat radical departure from earlier iterations of media literacy. Eleven skills are identified:

Play—the capacity to experiment with your surroundings as a form of problem-solving
Performance—the ability to adopt alternative identities for the purpose of improvisation and discovery

Simulation—the ability to interpret and construct dynamic models of real world processes

Appropriation—the ability to meaningfully sample and remix media content

Multitasking—the ability to scan one’s environment and shift focus as needed to salient details

Distributed cognition—the ability to interact meaningfully with tools that expand mental capacities

4 CRITICAL MEDIA LITERACY

Collective intelligence—the ability to pool knowledge and compare notes with others toward a common goal

Judgment—the ability to evaluate the reliability and credibility of different information sources

Transmedia Navigation—the ability to follow the flow of stories and information across multiple modalities

Networking—the ability to search for, synthesize, and disseminate information

Negotiation—the ability to travel across diverse communities, discerning and respecting multiple perspectives, and grasping and following alternative norms. (Jenkins, 2006b, p. 56)

What is significant about this version of media literacy is that it draws our attention to the assets that children and young people are already developing across a range of media contexts, stressing informal, playful, and creative engagements with media content. At the same time, it draws our attention away from the more serious and worthy work of analysis and critique that marks earlier descriptions of media literacy. Furthermore, the list implies a model of learning that is both collaborative and self-motivated.

An alternative view, and one that perhaps suggests a more reflective or critical producer and consumer, comes from the European Charter for Media Literacy (Euromedia, 2004). In contrast to the models discussed above, the European Charter is more explicitly linked to social policy. Bachmair and Bazalgette (2007), in their commentary on the Charter, identify the range of interests at work in current debate on media literacy and illustrate how the Charter attempts to establish a consensual and transnational agreement. Apart from explicit political interest they identify the competing voices of regulatory bodies, hardware and software providers, pressure groups, national cultural and religious institutions, as well as media producers, each with their own concerns and interests in media literacy.

Despite the potential conflicts of interest, the European Charter for Media Literacy has identified three interrelated strands (or aims) of media education, often referred to as the three Cs. These are:

- Cultural: broadening learners' experience of different kinds of media form and content.
- Critical: developing learners' critical skills in analyzing and assessing media outputs.
- Creative: developing learners' creative skills in using media for expression and communication, and for participation in public debate.

These three strands map onto a list of seven key competencies, described in the following way, in terms of what media literate people should be able to do:

- Use media technologies effectively to access, store, retrieve, and share content to meet their individual and community needs and interests.
- Gain access to, and make informed choices about, a wide range of media forms and content from different cultural and institutional sources.
- Understand how and why media content is produced.
- Analyze critically the techniques, languages, and conventions used by the media and the messages they convey.
- Use media creatively to express and communicate ideas, information, and opinions.
- Identify, and avoid or challenge, media content and services that may be unsolicited, offensive, or harmful.
- Make effective use of media in the exercise of their democratic rights and civic responsibilities.

Despite the broader goals of the Charter, these competencies do seem to draw together some key themes in the field of critical media literacy in a way that could easily translate into educational objectives. So whilst the Jenkins White Paper works well in describing the habits of mind and the practices that emerge with new media, as well as their implications for pedagogy and learning, the strength of the Charter is that it could be used effectively in curriculum planning.

In conclusion, it seems that there is no shortage of guidance on critical media literacy, and although there are differences in emphasis, there is broad agreement that developing the “knowledge, skills and understandings that are required to interpret, evaluate and produce media” (Buckingham, 2003, p. 36) is a desirable aim for both formal and non-formal education. Recent thinking on the topic emphasizes an “asset model” (Robinson & Mackey, 2006)—a model that examines the positive aspects of the many and diverse encounters with media and technology that pattern the lives of children and young people, providing an important counterpoint to risk discourses (Beck, 1992) and ongoing pre-occupations with safety and regulation. The asset view is well captured by Alvermann and Hagood in their review of research on critical media literacy in which they observe that:

Bringing together in literacy education the extremities forged between popular and canonical texts, out-of-school and in-school literacies, body and mind, and pleasure and work more fully reflects the blurring of boundaries of a post-modern society and the multiliteracies of everyday life. (2000, p. 201)

As we move toward this reconceptualization of literacy education there do, however, remain some important and unresolved dilemmas. The first of these concerns the various interpretations of the notion of criticality, as explored above. In some ways this debate mirrors some of the complexities in critical theory and in literary criticism. Perhaps we need to ask whether we want children and young people to rediscover the ideologies and biases that some adults have previously identified, whether we want them to become informed media critics or want them to be discerning consumers and producers of media. The second issue is whether or not we believe that the formal education system can be expected to bear the full responsibility of developing media literacy. Given that the major part of young people’s engagement with media is likely to take place outside of school contexts, there are good reasons to suggest that media literacy develops across a range of contexts and that parents, after-school clubs, community groups, as well as producers and independent agencies have an important role to play. Third, there are some contentious issues at stake in identifying what constitutes development in critical media literacy. For instance, in discussing literacy, the White Paper suggests that “Before students engage with the new participatory culture, they must be able to read and write” (Jenkins, 2006b, p. 19). But given that young children are already immersed in media culture—well before the start of their compulsory schooling—there are powerful arguments to suggest that critical media literacy should be taught alongside traditional literacy (see Marsh et al., 2005).

Finally, there is the question of how this kind of critical literacy can most profitably engage with some of the popular discourses about the harmful effects of media. These discourses often focus on the vulnerability of the young and the supposed dangers posed by early exposure to sex and violence; to manipulation through advertising; and to the possibility that they may become addicted to media. Although media education has contributed a degree of challenge to such views in the past, they have resurfaced in recent concerns about chat rooms, videogames, and online social networking. An open-minded and critical approach to media regulation and safety issues will need to have a central place in critical media literacy as it responds to changing contexts.

Critical Pedagogy

MANUELA GUILHERME

Introduction

Critical pedagogy is a movement that originated in the interdisciplinary field of education, which has nonetheless expanded into other disciplinary fields, and, therefore, it postulates an interdisciplinary approach regardless of which discipline it is applied to. Furthermore, the term “critical,” with its various interpretations, has gained meaning from original theorizations, mainly in philosophy, sociology, literature, and political science, each one acting as a main inspiration for the various definitions of the concept of a critical pedagogy. The notion of critical pedagogy/ies thus encompasses several definitions depending on the focus adopted. This focus may be educational, sociological, political, ethical, aesthetic, and even methodological—for example, dialogical, interactional, and so forth—and therefore each theory of a critical pedagogy will take a different perspective on the teaching/learning praxis it advocates. The idea of praxis, involving a dynamics between theory and practice, is a strong and innovative feature of critical pedagogy and one that emphasizes a move away from the notion of methodology in education.

The multiple, flexible, and eclectic nature of critical pedagogy makes the often simple task of labeling, defining, or describing it very complex. However, when you are sufficiently knowledgeable of its theoretical sources and experienced in the teaching/learning processes it involves, you will definitely be able to recognize it when you encounter it. First, it is defined as “pedagogy” rather than “teaching method” for a reason. Critical pedagogy includes teaching as part of the teaching/learning process, viewed as a dialectical and dialogical reproduction as well as a production of knowledge. Second, it implies both an epistemological turn, in that it is aimed at the critical apprehension and rebuilding of knowledge, and a methodological shift, in that it focuses mostly on purposeful action, that is, what to do with knowledge in order to cooperatively transform society for the better, rather than on the interaction aimed at acquiring ready-to-consume knowledge. Finally, the implementation of a critical pedagogy always takes into consideration the “situatedness” of the individual in place and time, each of which should be understood in their different concentric circles—from local to global and vice-versa—and in relation to their historical layers. It is therefore very much concerned with identity issues, with the learner’s individual and collective heritage and, as a result, with her/his social and political empowerment as a subject of knowledge since “critical pedagogy identifies the subjects who form the discursive community of learners and knowers” (Hovey, 2004, p. 248). On the whole, critical pedagogy may respond to the needs of contemporary education at all levels, from basic to higher education, as well as to the challenges of a global era, cosmopolitan societies, and an epistemological turn: “Critical pedagogy can provide insight and direction for this global turn in higher education by identifying sites of knowledge production resistant to change and offering productive ways of engaging in international or intercultural themes” (p. 247).

Philosophical Background

The notion of a “critical pedagogy,” as it is understood nowadays, gained momentum in the United States in the late 1980s and early 1990s, mainly based on North and South American thinking. It was also inspired by European thinkers, such as the Frankfurt School’s critical theory (e.g., Horkheimer, Adorno, Habermas) and the French so-called postmodernism (e.g., Foucault, Baudrillard, Derrida, Lyotard), as well as by American feminists (e.g., bell hooks); but the real source has mainly been South American postcolonial writers. The works of Paulo Freire—the Brazilian philosopher and educator (1921–97) who travelled widely, living and working in Europe and Africa—have provided the most solid and innovatory ideas for the theorization of critical pedagogy, in particular due to the notion of “*conscientização*” that he disseminated throughout the academic field of education studies, aiming to strengthen the political responsibility of education and educators and the perception of education as cultural politics.

The works of Habermas and Freire only meet on very general points shared by both critical theory and critical pedagogy, such as the promotion of a strong and pragmatic relationship between theory and practice together with a metatheoretical approach, since “both authors work within the broader metatheoretical tradition of a critical hermeneutics . . . as well as take into account the social structural contexts of action” (Morrow & Torres, 2002, p. 15). In addition, both put a strong focus on communication/dialogue and on social agency. However, their “lifeworlds,” to use Habermas’s term, hardly touch, apart from the fact that they share the same generation and some of the academic readings on philosophy, sociology, and political science which predominate in European academic circles. But Freire could not or did not want to ignore his vision and knowledge centered on the southern hemisphere, or his educational experience with nonacademic communities in rural areas on both sides of the southern Atlantic, which he brilliantly explored and developed. This perspective in his work makes the difference and gives it the potential to respond to the needs of education at a time of globalization, mobility, and epistemological change. This is the reason why the critical pedagogy that he proposes is not geographically, culturally, or temporally circumscribed and it re-appears again and again as an ontological, epistemological, and intellectual pedagogical movement in various parts of the globe, adding to and expanding different theories and practices historically developed in specific communities.

Critical Pedagogy and Citizenship

Critical pedagogy meets the challenge of dealing with culture by “bringing the laws of cultural representation face to face with their founding assumptions, contradictions and paradoxes” (McLaren, 1994, p. 216). It is also interwoven with the notion of ethics, both observant of universal human rights and attentive to particular stories located in specific contexts. Giroux, one of the strongest advocates of critical pedagogy in North America, states that “ethics must be seen as a central concern of critical pedagogy” and in his view, within the framework of a critical pedagogy “ethics is taken up as a struggle against inequality and as a discourse for expanding basic human rights” (Giroux, 1992, p. 74). In relation to ethics, issues of human suffering, dignity, and emancipation are concerns which are central to critical pedagogy. Within this framework, critical pedagogy is vital for the accomplishment of multicultural/intercultural democratic citizenship education programs. In Freire’s words, “to be human is to engage in relationships with others and with the world” and he adds that “men relate to their world in a critical way” as “they apprehend

the objective data of their reality (as well as the ties that link one datum to another) through reflection—not by reflex, as do animals” (1974, p. 3). These axiomatic statements also invite us to reflect upon the nature and nurture of the world to which humans relate and upon the humans who, in turn, relate to one another.

Pedagogy Versus “Standardcy”

Despite the diversity of practices, which is itself encouraged by the literature on critical pedagogy, and the various theories which have stemmed from the original idea of a critical pedagogy, it provides educators of every discipline with a systematic and solid corpus of principles and with a vision of the pedagogical process and purpose. Although during this first decade of the 21st century, the notion of “pedagogies” has been supplanted by the requirements of “standards” and, therefore, the focus on process has been replaced by a concern for results, as a product, and although critical pedagogies have tended to be overlooked, they have also been recognized as more and more indispensable in order to ensure that education does not betray its nature and intention. While the notion of critical pedagogy and the “standardmania” dominant nowadays are, in principle, radically incompatible, a knowledgeable and critical combination of the two may set limits to simplified overstatements of each of them. In this case, standards should be used within a wider framework of a critical pedagogy, and not the other way round, since the latter provides a philosophical—both ontological and epistemological—and a political understanding of diversity in education, while the former offer a number of general guidelines aimed at homogenizing education, which can also be helpful, provided they are treated as complementary, rather than as a priority. They are also radically divergent in their goals since a critical pedagogy aims for an active citizen prepared to intervene in society, while a “standards technocracy” aims for a “competent” individual ready to adapt to and serve society as it has been structured by dominant and established powers.

Although these are opposing visions of education theory in essence, they are nevertheless condemned, in practice, to cohabit in the same educational system and, therefore, in each individual “educatee.” The education system, including life-long learning programs, must provide space for educators and educatees to develop both these visions, according to moral, civic, and professional patterns which are offered to them by their caring families and communities, their democratic societies, their critical educational institutions, and a global and free world.

Intercultural Responsibility: Moving Beyond Intercultural Competence

This reasoning also suggests a move beyond the concept of “intercultural competence” towards a notion of “intercultural responsibility,” a term coined by Guilherme and developed by the international team behind the ICOPROMO Project, in particular by the Portuguese team (Guilherme, Keating, & Hoppe, 2010). This project aimed to build a bridge between pedagogy and training, producing materials for professional development in intercultural communication and interaction. While Phipps and Gonzalez (2004) and Byram (2008) worked on the idea of an “intercultural being,” both Fleming and Risager, in particular, argued for an expansion of the term “intercultural competence.” On “key aspects of the holistic concept of intercultural competence such as empathy, openness, tolerance of ambiguity, readiness to decenter, willingness to engage with others and to try anything

new,” Fleming recognizes that “to say that someone possesses such traits is implicitly to say something about their propensity,” and that “it is also to make a statement about how they will be rather than just how they will perform” (Fleming, 2009, p. 9). Risager also challenges the concept more and more daringly as she states that “intercultural competence is very much the competence of navigating in the world, both at the micro-level of social interaction in culturally complex settings, and at macro-levels through transnational networks like diasporas and media communications” (Risager, 2009, p. 16). The notion of “intercultural responsibility” therefore adds a social, relational, civic, and ethical component to the conception of “intercultural competence” in that it “raises issues concerning the negotiation between the similar and the contrasting aspects of different ethical frameworks, in particular how this negotiation is verbalised and performed” (Guilherme et al., 2010, p. 83).

A Critical Pedagogy of Language and Culture

Language and culture are therefore important elements to consider in critical pedagogy, in their power workings and identity shaping within multilingual and multicultural cosmopolitan societies. In addition, while critical pedagogy is essential for the full accomplishment of multicultural/intercultural democratic citizenship and professional education, second or foreign language and culture education is a fundamental element for the full accomplishment of a critical pedagogy. Giroux is very clear on this:

Knowledge cannot be only indigenous to be empowering. Individuals must also have some distance from the knowledge of their birth, origins and specificity of place. This suggests appropriating those knowledges that emerge through dispersal, travel, border crossings, diaspora and through global communications. (Giroux, 2006, p. 165)

A critical approach to living experiences of difference is vital both for the development of a critical pedagogy and for the effectiveness of language and intercultural education, and both within the conceptual framework of a critical intercultural citizenship education. The interaction and complementariness between citizenship education, intercultural education, language/culture education, and critical pedagogy give way to the emergence of “critical cultural awareness,” a notion put forward by Byram and adopted by Guilherme (Byram, 1989, 1997; Guilherme, 2002). Critical cultural awareness entails a *savoir s’engager*, according to Byram’s definition, that is, it goes beyond a critical understanding and interpretation of difference and intercultural relations into critical commitment and action. Nevertheless, Byram reminds us that “the definition of critical cultural awareness emphasises the importance of individuals being aware of their own ideology—political and/or religious—and the need to be explicit in one’s criteria of evaluating other people’s action” (Byram, 2008, p. 165). Critical cultural awareness is also understood as going beyond an individual towards a collective dimension by undertaking “a philosophical, pedagogical, and political attitude towards culture” (Guilherme, 2002, p. 219). Not only is it geared towards self-awareness or one-to-one communication, but also to collective micro- and macro-contexts and, therefore, is sensitive and attentive to ontological, epistemological, social, and pedagogical issues and changes in language and culture education. In sum, it is through the development of critical cultural awareness, through “a critical pedagogy of (foreign) language/culture education and of intercultural communication/interaction [which] implies a critical use of language(s), a critical approach to one’s own and other cultural backgrounds and a critical view of intercultural interaction,” that a critical pedagogy constitutes such an impressive element and contribution to civic and global education (Phipps & Guilherme, 2004, p. 3).

Intercultural Mobility

Communities resulting from all types of intercultural mobility cut across the cultural limits of the social and professional structures from which they emerge and create very particular dynamics, with both positive and negative impulses. Intercultural mobility creates a rich and complex holistic process which goes beyond mere displacement, straightforward multicultural interaction, or detached cross-cultural communication. As Barton and Tusting point out “discourse and power are central to understandings of the dynamics of communities of practice” (2005). Thus, from our point of view the development of intercultural competencies requires not only an awareness of the meaning-making mechanisms, “*conscientização*”—a recurrent theme in Freire’s works—but also dialogical tools for engaging in cross-cultural interaction and communication. It is also necessary to develop an ability to manage and explore these mechanisms and tools in order to achieve effective intercultural communication and interaction competence, which are fundamental for living in new and emerging communities and being active citizens in those communities (Guilherme, 2000). The conceptual framework of critical pedagogy makes all the difference for the definition of “effective” intercultural communication and interaction in that it develops the concept of dialogue in complexity, that is, by moving beyond the idea of apparent consensus and superficial harmony. Since a critical pedagogy looks suspiciously on power dialectics, dialogue is not “*naïf*,” in Freire’s words, and, therefore, “it cannot exclude conflict” since they “interact dialectically” (Freire, 1979/2007; author’s translation). Within this view, “effective” critical intercultural dialogue does not aim at a final consensus or expect enduring cordiality throughout. Instead it is built upon unstable and dynamic platforms of understanding/misunderstanding and temporary agreements/disagreements, based on reciprocal and respectful communication and collaboration, to be negotiated again and again with an eye on the power issues to be fought for and against.

Intercultural Dialogue

The Council of Europe describes intercultural dialogue “as a process that comprises an open and respectful exchange of views between individuals and groups with different ethnic, cultural, religious and linguistic backgrounds and heritage, on the basis of mutual understanding and respect” (2010, p. 23). However, in the same document—the *White Paper on Intercultural Dialogue*—it adds that “the universal values upheld by the Council of Europe are a condition for intercultural dialogue. No dialogue can take place in the absence of respect for the equal dignity of all human beings” (p. 26). In fact, these statements may be mutually contradictory, since the former statement accounts for diversity whereas the latter accounts for inferred universality, and a critical pedagogy would address this. Either the affirmed universal values are understood to be mutually claimed, within a certain limit, or they are besides uniformly translated. Here lies the cornerstone of critical intercultural dialogue. According to Santos, “the central task of emancipatory politics of our time, in this domain [a counter-hegemonic human rights discourse and practice], consists in transforming the conceptualization and practice of human rights from a globalized localism into a cosmopolitan project” (Santos, 1999, p. 220). Among the five premises that he identifies as necessary for that transformation to take place, the second premise involves the recognition that “all cultures have conceptions of human dignity but not all of them conceive it as human rights” (p. 221). Santos adds a third and a fourth premise: that “all cultures are incomplete and problematic in their conceptions of human dignity” and that “all cultures have different versions of human dignity” (p. 221). Having this in mind, a critical pedagogy tackles the idea of universal values by assuming that they encompass the discussion of a variety of perspectives upon them.

A Critical Pedagogy of Interculturality

It is possible for an individual to accept, enjoy, and live diversity, to adapt and be personally and professionally successful in a multicultural setting. This individual can even experience some ontological and epistemological change. However, a critical pedagogy requires “a critical cycle,” that is, “a reflective, exploratory, dialogical, and active stance towards cultural knowledge and life that allows for dissonance, contradiction, and conflict as well as for consensus, concurrence, and transformation” (Guilherme, 2002, p. 219). This process would entail the experiencing of a series of operations

gathered in three main moments: (a) when one approaches and responds to culture(s)—experiencing, exploring, wondering, and speculating; (b) when one engages with and embarks on (inter)cultural observation, research and interpretation—appreciating, commenting, comparing, reflecting, analysing, and questioning; and (c) when one performs (inter)cultural acts and transforms cultural life—hypothesizing, evaluating, negotiating, deciding, *différant*, and acting. (p. 221)

Such operations should nevertheless require “a cognitive and emotional endeavour that aim[ed] at individual and collective emancipation, social justice and political commitment” (Guilherme, 2002, p. 219).

Although neither Habermas nor Freire focused on language education per se, the work of both revolved around critical issues in language education and linguistics in their theoretical developments on communication and dialogue. They, along with their followers, provided these fields in the social sciences with essential theoretical and praxeological conceptual tools within the critical theory and critical pedagogy frameworks that may offer some guidance for exploring the potential of linguistically and culturally diverse societies in a globalizing world, where central and peripheral nations are renegotiating their positions of influence. Nevertheless, a critical pedagogy of language and intercultural communication leads to a critical hermeneutics and heuristics of intercultural dialogue and collaboration which requires the development of a notion that Guilherme calls “intercultural responsibility,” since it encompasses and implies a relationship—be it professional, civic, personal, or civic and personal—a commitment to social justice and an active involvement in matters of individual dignity and collective interest (Guilherme et al., 2010). This perspective requires more than intercultural competence, broad as this concept may be, and leads to a compromise between different traditions of cross-cultural relations stemming from European and non-European civilizations—northern, southern, eastern and western—brought into contact in commercial exchanges or religious missions within colonial efforts and establishments. On the whole, these various types of contacts have developed diachronically and fall into two main conceptual frameworks, multiculturalism and interculturality. The former features cross-cultural relations historically characteristic of northern-European settlements, while the latter sprung up over time and suited Iberian types of missionary imperialism and colonialism, and has also inspired contemporary theories of postcolonial intercultural dialogue. This is also the source of Guilherme’s theorization on intercultural responsibility, which owes much to a critical pedagogy as it has been developed based on Freire and his followers’ postulates.

Critical Pedagogy in Language Teaching

GRAHAM CROOKES

Critical pedagogy in language teaching is a perspective in language curriculum theory and instructional practice that supports and advances teaching and the study of languages in ways that would promote social justice. In this case, the popular term “social justice” is based on one or more critiques of present-day society (or societies) that reflect the interests of the working class, women, non-heterosexuals, ethnic minorities, and marginalized peoples, and includes perspectives that valorize environmental conservation and peace. “Critique” refers to systematic and constructive criticism based on empirical and theoretical study of society, language, and the person, reflecting alternative, progressive, or radical theories of societies, individuals, and languages. Language is understood here broadly, as having both structural and functional dimensions, socially implicated as discourse and thus involved in the construction of individuals and the maintenance and change of societal structures.

The term “critical pedagogy” was attached to the work of Brazilian literacy educator and curriculum specialist Paulo Freire (e.g., 1967/1974), its central figure, during the late 1970s; that is, some years after his writings became popular outside his home country. According to Henry Giroux (<http://www.freireproject.org/content/henry-giroux-interview>), he and Freire discussed what useful label could be attached to this line of work and considered “radical pedagogy,” but discarded it as too challenging. They substituted the less transparent, perhaps more inclusive term “critical” for “radical.” This suggests a connection to the area of social theory known as “critical theory,” but the link is not close in early work in this area (Blake & Masschelein, 2003). Given the breadth of developments in this area, the very long-standing and unconfined term “radical pedagogy” might have been a better choice (see Gore, 1998). However, the fact remains that “critical pedagogy” is the most widespread term for social justice-oriented tendencies in applied linguistics and in language teaching. (For more explicitly theoretical or disciplinary understandings in applied linguistics, we also have the term “critical applied linguistics”; Pennycook, 2001.)

Initially, Freire’s critical pedagogy was an approach to first and second language literacy based on Catholic, progressive, and radical critiques of society. In it, literacy was to be taught in such a way that the poor and the working class could interpret reality so as to be able to act on it to improve their lives. Class was the primary unit of analysis in Freire’s work, along with the idea that the “human vocation” involved one’s ability to care for others and improve oneself (see Taylor, 1993).

What critical pedagogy has become is much broader than that. Freire originally thought of oppression as mostly what is experienced by the working class at the hands of the ruling class. But as radical social thinking and theorizing developed along with the growth of social movements over the decades of the end of the 20th century, other important aspects or sites of oppression became more visible and organized. Thus the feminist movement entered its second wave after the late 1960s; race-based social critique became more obvious; gender orientation became recognized as a site of oppression and a place of pedagogy; and issues of peace and environmental protection all developed curricular manifestations.

2 CRITICAL PEDAGOGY IN LANGUAGE TEACHING

These areas developed instructional and theoretical manifestations within applied linguistics and language teaching. Mainstream critical pedagogy continued to develop as well (e.g., Apple, Au, & Gandlin, 2009).

Core elements of practice, both in Freire's L1 literacy work and in L2 language teaching of a critical nature, can be sketched without in any way suggesting that there is one fixed "method" implied by these elements. One central feature is that the elements of the language curriculum should relate to the issues of the students' life and the things in their life that are problematic, which they might be able to change and improve through the tool of literacy or an additional language, and the changed consciousness that would come from that. When Freire's original literacy courses were delivered within the students' home communities, the instructional team spent time living in the community, to develop an ethnographic critical needs analysis. A characteristic feature was and still is the use of visual images (pictures or photos) or realia concerning aspects of the students' life. Pictures may be used as projective devices; through commenting on them and discussing them, students develop or articulate some aspects of the topics or language content they wish to learn that they wish to be able to command. In addition, since one underlying goal of the approach is to foster the freedom and ability to act of the students, the students themselves play a substantial role in the development of curriculum content and even of materials.

L2 specialists began to take up Freire's work from the late 1970s on, but much more substantially after the mid-1990s. Foreign language teaching in the USA early witnessed publications identifying a critical pedagogy for languages such as French or Spanish in the high school or university. Crawford (1978) derived principles for language critical pedagogy from Freire's work, and these illustrate core values in critical pedagogy as well as alerting teachers to some of the challenges of implementing it. They include the following:

- The purpose of education is to develop critical thinking by presenting students' situation to them as a problem so that they can perceive, reflect, and act on it.
- The content of curriculum derives from the life situation of the learners as expressed in the themes of their reality.
- The learners produce their own learning materials.
- The task of planning is first to organize generative themes and second to organize subject matter as it relates to those themes.
- The teacher participates as a learner among learners.
- The teacher contributes his or her ideas, experiences, opinions, and perceptions to the dialogical process of the course.
- The teacher's function is one of posing problems.
- The students possess the right to and power of decision making.

The most prominent early adopter of Freire's ideas in English as a second language (ESL) was Elsa Auerbach, whose publications continue to be very important for teachers who wish to know what critical language pedagogy looks like in practice (e.g., Wallerstein & Auerbach, 2004). Newer proponents of critical pedagogy in world languages have provided useful analyses and advocacy (Reagan & Osborn, 2002) and some accounts of actual short pedagogical initiatives (e.g., Ohara, Saft, & Crookes, 2001). The area has also expanded into more academic language teaching (Benesch, 2009). In its emphasis on the needs of students and their active role in their education it is consistent with other recent developments such as task-based language teaching and learner autonomy.

Feminist pedagogy has been promoted in language teaching particularly by Vandrick (e.g., 1998), who draws on elements of feminist process to describe feminist classroom

participation practices, which ensure female students have equal time and assist and direct male students in fulfilling this goal. Feminist language curriculum means the teacher makes sure the classroom content is bias-free, avoids stereotyping, and puts women-related matters at the center of content.

For language teaching, race as a form or site of oppression has been worked on only quite recently. Oppression based on societal insistence on a particular sexual orientation and oppression of those not conforming (heterosexism) has been recognized by radical educational practitioners and has produced both practical and theoretical work in language teaching (e.g., Nelson, 2008).

It has been suggested that critical pedagogies are inappropriate for use in some cultures. This view strongly generalizes the characteristics of some parts of mainstream schooling or other temporary historical-cultural conditions to cultures or countries as a whole (see Shin & Crookes, 2005a). Reports of language critical pedagogy tended to favor ESL settings, though an increasing number of explorations are reported (e.g., Shin & Crookes, 2005b) concerning the teaching of English in foreign language (EFL) contexts.

The number of publications on language critical pedagogy continues to grow, reflecting (though perhaps exceeding) practice. In recent years the area has acquired a journal (*Critical Inquiry in Language Studies*) and a professional society (the International Society for Language Studies) notably hospitable to ideas of critical language pedagogy and associated positions. A research agenda for the area has become clearly specified (Crookes, 2009). The conceptual and theoretical expansion of the area (as well as the breakup and increased diversity of public and private sectors of education in the 21st century) allows the proponents of language critical pedagogy to view the future for their initiatives with optimism.

Critical Period

KENNETH HYLSTENSTAM

The scholarly discussion on the notion of a critical period (CP) for language acquisition dates back to the 1950s and 1960s, when first Wilder Penfield and Lamar Roberts (1959) and later Eric Lenneberg (1967) suggested that differences in the outcomes of child and adult second language acquisition most likely had a biological basis. Penfield and Roberts claimed that, up until the age of approximately 9 years, “the child’s brain has a specialized capacity for learning language” (p. 240), and Lenneberg observed that “[f]oreign accents cannot be overcome easily after puberty” (p. 176). Lenneberg’s treatment of the issue, however, was based mainly on first language data and demonstrated the effects of a presumed CP in the area of recovery from aphasia, for which children stood a good chance of total recovery, while recovery by adults was often less successful. He considered at the time that puberty coincided with the completion of hemispheric lateralization for language and therefore thought that the loss of a biological predisposition for language acquisition could be related to lateralization.

Over time, especially in recent years, the concept of a CP for language acquisition has come under intense debate. In particular, although there is unanimous acceptance of the fact that children eventually reach a more native-like level of proficiency in a second language than learners who start learning a second language as adults, there is no consensus that this difference has a biological foundation, as the critical-period hypothesis (CPH) would predict. This disagreement is partly due to differences in the understanding of what the notion of a critical period as such entails, to which we will return below. Another more basic and philosophical cause for the controversy is the central and symbolic role the notion plays in the nature–nurture divide. Ideological preferences among researchers to stress either biological or environmental aspects of language development play a role in this regard. The rhetorical tone that is sometimes noticeable in debates on the CPH to a considerable extent has its origin in the epistemological commitment of the researchers—nativist (proponent) or constructivist (opponent), cognitive (proponent) or social constructivist (opponent), general cognitive (opponent) or modular (proponent), and so on. Those opposing the existence of a CP argue that social, cognitive, or psychological factors provide a better explanation for the differences between children and adults in the eventual outcome of language acquisition. There is also some discussion of the fact that the configurational requirements of a CP, especially in terms of a clear cut-off point after which acquisition would not be possible, are not fulfilled. Although the rest of this entry will focus on the arguments for and the workings of a CP for language acquisition, space will also be given to a more detailed presentation of the criticisms that have been leveled against the existence of a CP.

The notion of a CP has its origin in the biological sciences and was used by ethologists to account for the observation that species-specific development and eventual behavior in a specific area are dependent on early and well-timed exposure to certain environmental stimuli. A CP can therefore generally be defined as a time span in early life during which the organism is responsive to stimuli that are crucial or relevant for a behavior (or capacity) to develop in keeping with a species-specific standard. If the organism does not encounter or experience the particular stimuli during the time span for sensitivity, that behavior will either not develop at all or eventually reach an end state that differs from the species-specific ultimate standard.

2 CRITICAL PERIOD

Examples of such maturationally constrained behaviors range from imprinting in geese and song learning in songbirds to bonding in sheep and vision in cats and primates. The effects of maturation on minute details of behavior are continuously being mapped out, especially in neurobiological research. The classic results from studies on critical periods for vision in cats obtained by the 1981 Nobel medicine laureates David Hubel and Torsten Wiesel have been followed by detailed studies of vision in primates. Among the best understood negative CP effects in human vision are deficits in keen binocular vision and stereopsis among humans. Such deficits result from the fact that certain cells in the visual cortex, the so-called binocular cells, were not “activated” normally during the right period, between 4 and 6 months of age, because of a disruption in binocular vision. This happens, for example, in individuals suffering from *strabismus* (i.e., an affliction in which the two eyes look in different directions). For binocular cells (80% of the relevant visual cells) to develop normally, they must respond to the same input from either eye. When this is not possible because both eyes cannot focus on the same visual stimulus simultaneously, one eye, which becomes the “good” eye, takes over and all cells become monocular. The CP for stereopsis is thought to end around 8 years of age, as reflected in the effects of treatment, with better effects the earlier the treatment is carried out and little effect after 9 years of age.

Similar to what can be found for language acquisition, however, there are spectacular exceptions, as in the case of “Stereo Sue,” who developed stereo vision at the age of 48 (Barry, 2009). In general, with strabismus as in many other behavioral areas, the dependence on a CP is not categorical: Some abilities can in fact develop also after the CP, which is therefore sometimes characterized as a “time of maximum neurological plasticity” (Cooper & Cooper, 2010). Furthermore, it has been demonstrated that brain plasticity in the area of vision can be manipulated pharmacologically. On the one hand, plasticity during the CP can be abolished by certain chemical substances, and, on the other, the CP can be extended through degradation of factors that normally increase at the end of maximum plasticity, such as myelination (the process whereby parts of the nerve cells are progressively covered by a fatty substance), in this case by mutants of the myelin protein (Daw, 2006).

Returning to language, the idea of a CP has been applied to all types of language acquisition, such as first and second language acquisition, typical and atypical language acquisition, and oral and visual (sign) language acquisition. In first language acquisition, it is only from the comparatively few exceptional cases of delayed exposure to any language at all that detailed information can be gained concerning the effects of a presumed CP. Examples include the well-known case of Genie, deprived of language exposure during childhood (Curtiss, 1977). For second language acquisition, in contrast, there is a massive amount of data available on language acquisition starting at different phases of the life span.

Considering the complexity of human language as a system of communication, it is highly likely that maturation will affect some but not all aspects of language behavior. Different parts or components of language may be constrained differently and heterochronously, that is at different times during development, as reflected in the notion of *multiple critical periods*. Also, much language learning occurs with reasonable ease over the entire life span of a human, for example, the learning of new vocabulary. What seems to be the key parameter distinguishing child learners from adult learners is the fact that young learners in the majority of cases seem to be able to reach an overall proficiency level in the second language, phonetics/phonology included, that allows them to be considered native speakers of that language, which is an extremely rare feat for adult learners:

automatic acquisition from mere exposure to a given language seems to disappear [after puberty], and foreign languages have to be taught and learned through a conscious and labored effort. Foreign accents cannot be overcome easily after puberty. However, a

person *can* learn to communicate at the age of forty. This does not trouble our basic hypothesis on age limitations because we may assume that the cerebral organization for language learning as such has taken place during childhood, and since natural languages tend to resemble one another in many fundamental aspects . . . the matrix for language skills is present. (Lenneberg, 1967, p. 176)

This quote from Lenneberg addresses many of the issues that have been researched and debated over the years. In addition to underscoring that (a) the ability to reach *native-like* ultimate proficiency for L2 learners is largely restricted to those who start using the second language before puberty, it considers (b) puberty as the end point for a CP, (c) the effect that any early language exposure can have on subsequent language acquisition, and (d) the difference between automatic or implicit acquisition assumed to be possible within the CP, and the conscious or explicit learning postulated to be the only remaining option for late learners. Furthermore, although unmentioned in this particular quote, Lenneberg proposed (e) *lateralization* as the neural mechanism that could account for puberty as the end point for the CP. However, this role for lateralization was soon shown to be incorrect.

With respect to the first point, namely the differentially obtained native-likeness in younger and older language starters, which must be considered to be the most central aspect of the hypothesis, empirical observations are compatible with the CPH, that is, that child learners frequently produce results in the range of native controls, whereas such results have rarely, or even perhaps never, been demonstrated by adult learners (Hyltenstam & Abrahamsson, 2003; Long, 2005). Despite the central nature of native-likeness, many studies on the CPH do not focus on this aspect of acquisition. More frequently, it is the level of *ultimate attainment*, native-like or not, among younger and older learners that is correlated with age of onset (AO). One of the most robust results in CPH-related research is a strong negative correlation between AO and ultimate attainment in a second language.

As for the second point, a multitude of studies have agreed on puberty or early adolescence as an end point for native-like proficiency levels in a second language. Several other studies have pointed to a discontinuity at earlier ages, in particular around age 6, especially for phonology and grammar (Long, 2005; see, especially, Johnson & Newport, 1989).

In relation to the third point, the hypothesis predicts that delayed exposure to an L1 should affect the level of ultimate attainment more severely than delayed exposure to an L2. Case studies of abused children who have not been exposed to any language before puberty (Curtiss, 1977) show severe limitations in development of grammar and pronunciation, whereas learning a second language from the same age allows high levels of proficiency in that language. It has frequently been pointed out that deprivation data are difficult to interpret in terms of a CP for language; however, similar results have also been obtained from studies of delayed first language exposure to American Sign Language (ASL) (e.g., Mayberry, 1993).

The fourth point, on the distinction between (implicit) acquisition and (explicit) learning, has been dealt with in a series of theoretical discussions about language-learning differences between children and adults (see DeKeyser, 2003). Some of its most well-known exponents are Krashen's *acquisition-learning hypothesis*, Bley-Vroman's *fundamental difference hypothesis*, and Felix's *competition hypothesis*. Also the various perspectives on access to universal grammar (UG) (full/direct, partial/indirect, or no access) in UG-framed SLA theories (see White, 2003) can be translated into a CPH framework (see Pinker, 1994: "use-it-then-lose-it").

With respect to neurological correlates of the CPH, greater prepubescent brain plasticity and successive decreases in such plasticity have generally been referred to. With respect to the specific character of this plasticity and change, a number of possibilities have been offered, all related to developments in the brain that are known to occur during childhood

4 CRITICAL PERIOD

and adolescence. Some of these (myelination, slow prefrontal development) have explicitly been explored as possible correlates of the CPH, while others have been mentioned in more general discussions about child–adult differences.

At a non-anatomic level, especially in recent decades, decreasing plasticity has been related to what has been called L1 entrenchment, that is, a perspective in which the first language progressively becomes an obstacle for additional language learning, thus impeding native-like second language ultimate attainment (Ventureyra, Pallier, & Yoo, 2004). In opposition to the latter view, Hylltenstam, Bylund, Abrahamsson, and Park (2009) claim that the empirical basis for this impediment account is weak.

As mentioned initially, a number of counterarguments to the CPH have been put forward over the years. There is a current consensus that some of these are, in fact, not valid arguments as they deal either with phenomena that are not covered by the hypothesis or with issues that are not decisive components of it. Examples of the former are early objections to the CPH based on results showing that younger learners are, in fact, *not* better than older learners in terms of the initial rate of learning a second language (Snow & Hoefnagel-Höhle, 1977). The reason this is not a valid counterargument is that the CPH is not concerned with what happens in the initial stages of second language learning but instead pertains to long-term impacts, that is, what is ultimately attainable in language acquisition/learning. An example of objections to nondecisive components is the type of criticism that says that, if lateralization is not the cerebral mechanism behind the differential behavior of children and adults, there can be no CP. The CPH is not dependent on lateralization as such; other cerebral mechanisms may instead be at work.

More substantial criticisms of the CPH have frequently focused on the correlation between AO and ultimate attainment. For various reasons, most prominently because correlation does not equal cause, results showing a strong negative correlation between AO and ultimate proficiency are not accepted by everyone as evidence of maturational constraints. It has been suggested that there may be other factors of a social or psychological nature, such as length of residence, input frequency, motivation, general cognitive changes, or first language use, that could explain these correlations (see Flege, Frieda, & Nozawa, 1997). However, in studies that have used statistical measures that are able to assess the relative weight of different influencing variables, it has consistently been shown that AO is the strongest and often only factor in predicting ultimate attainment. Often approximately 50% of the variance is explained by AO, whereas other factors add only 2–6% in accounting for the variance (see DeKeyser & Larson-Hall, 2005).

Second, it has been claimed that AO and ultimate attainment correlations exhibit patterns of a linear decrease rather than one of discontinuity, which would be expected for the CPH: At the end of the period there should be an obvious offset, after which we would expect a flattening of the interaction between AO and ultimate attainment. Studies such as Bialystok and Miller (1999) obtained results indicating a linear decline through all AOs, and Birdsong and Molis (2001) saw age effects among postpuberty and adult learners generally. These authors interpret their results as evidence against the CPH and suggest general age-dependent cognitive factors as causes. However, another possibility for linear decrease might be a combined effect in which maturation plays the dominant role until puberty and adolescence and in which social/psychological factors become more important for explaining variation after maturation is complete (Hylltenstam & Abrahamsson, 2003). In light of these findings, it is probably fair to say that the issue of discontinuity is not yet solved.

Finally, counterarguments have addressed the issue of native-likeness as evidence for the CPH. Some authors claim that native-like ultimate attainment among late learners is not as rare as has been previously thought, something that would indeed falsify the hypothesis. Birdsong (2005) reviewed frequencies of L2 participants who performed in the

range of native speakers and claimed that studies show up to 15% of postpuberty samples that reach this level. Conversely, many studies have shown that it is hardly the case that native-like ultimate attainment is always or nearly always obtained by learners with prepuberty AOs (Abrahamsson & Hyltenstam, 2009).

Research related to the idea of a CP for language is central to language acquisition theory, in particular for the understanding of defining differences between first and second language acquisition. Intensive efforts to improve our understanding of the factors behind age differences in language acquisition outcomes have been made over the last 15 years, but the field is far from approaching a consensus about the role of maturational constraints. However, current claims for reconsidering definitions of concepts, analytical instruments, and research methodologies (see, e.g., Hyltenstam & Abrahamsson, 2003; Birdsong, 2005; Long, 2005) are promising for decisive steps forward in the near future. A fruitful perspective may be to line up linguistic CPH studies with views on CPs in areas other than language. Expressions such as the frequently used “window of opportunity,” in the sense of a brief and well-defined period of time during which an opportunity must be exploited or else missed, may be replaced by expressions such as “optimal periods,” “sensitive periods,” a “period of maximum neurological plasticity” (Cooper & Cooper, 2010), or “maturational period” (Hyltenstam & Abrahamsson, 2003). Such changes may be far more than mere changes in terminology and would instead reflect what we know for a fact: that language learning—and possibly acquisition—takes place even outside the period that is most advantageous for language acquisition. They would acknowledge the fact that a period of maximum plasticity does not end at a single point in time, but rather over a longer period during adolescence.

Critical Race Theory and Qualitative Research

RYUKO KUBOTA

Critical race theory (CRT) developed in the scholarly field of legal studies in the United States, and was later introduced to the fields of education and applied linguistics. It is built on the recognition that racism is endemic to American society. CRT foregrounds race-based critiques exposing—through counter-storytelling that challenges majoritarian narratives favoring White privilege—the injuries of racism experienced by people of color with the aim of eradicating racism and other social injustice. It challenges the normalcy of White Eurocentrism in various facets of everyday life, while acknowledging the dynamic and diverse nature of the experiences of racially subordinated groups. As such, CRT problematizes and rejects a modernist pursuit of the monolithic objective truth that explains human experiences and social practices through a lens of Whiteness. CRT is philosophically compatible with critical intellectual approaches such as postmodernism, poststructuralism, critical pedagogies, and critical multicultural education.

CRT is relatively new to applied linguistics. Research focused on race and racism within the field has not always drawn on CRT, nor has it been only compatible with qualitative methodology (e.g., see Rubin, 1992, for a quantitative study on the impact of instructor's race on students' listening comprehension and perceived accentedness). However, CRT provides researchers with a coherent conceptual lens to focus on race, racialization, and racism as essential factors that shape individual experiences of people of color and social practices. Before discussing CRT, it is necessary to define "race" and "racism" as key terms in this inquiry.

Race and Racism

Although the term "race" is often associated with physical characteristics such as skin color and facial features, it is in fact a social construct rather than a biological category. Scientific evidence has confirmed that all human beings, despite apparent physical differences, are genetically more or less the same. Nonetheless, the idea of race evokes differences among groups of people according to phenotypical characteristics that are visibly different. Thus, although race does not exist biologically in a scientific sense, the idea of race exists and can be investigated as a socially constructed category (Kubota & Lin, 2009).

In contemporary discourse, any reference to race is often avoided and instead replaced by the more benign notions of culture and ethnicity, two closely related constructs, constituting *cultural racism*. Bonilla-Silva writes: "*Cultural racism* is a frame that relies on culturally based arguments such as 'Mexicans do not put much emphasis on education' . . . to explain the standing of minorities in society" (2003, p. 28).

As for racism, various scholars have offered slightly different definitions. For instance, Omi and Winant (1994) define racism as "a fundamental characteristic of social projects which create or reproduce structures of domination based on essentialist categories of race" (p. 162). In general, racism is a mechanism that produces a relation of domination and subordination among racialized groups and perpetuates the unequal relation of power.

2 CRITICAL RACE THEORY AND QUALITATIVE RESEARCH

In everyday discourse, racism is typically associated with bigotry and personal discrimination, which constitutes individual racism. However, racism also exists at the institutional level, as seen in racial inequality in employment, education, housing, health care, and so on. Moreover, epistemological racism shapes mainstream legitimated knowledge about history, philosophy, and other disciplines, based solely on White intellectual traditions (see Kubota & Lin, 2009).

Development of CRT

CRT has its origin in legal studies. It branched off in the 1980s from critical legal studies—a progressive movement that began in the 1970s within the liberal civil rights tradition in legal academia in the United States—with a specific focus on how law and legal practices produce unequal relations of power with regard to race (Crenshaw, Gotanda, Peller, & Thomas, 1995). Pioneered by scholars of color within legal studies, CRT has critically scrutinized the US legal system, which claims to be objective, fair, and colorblind and yet favors the racially and economically privileged. As such, CRT investigates and transforms the relationship among ideas of race, racism, and power (Delgado & Stefancic, 2001).

CRT has been developed into LatCrit (Latina/o critical race), AsianCrit (Asian critical race), and TribalCrit (tribal critical race) theories. They go beyond the Black/White binary to address specific issues, such as language, immigration, and stereotypes, that are relevant to Latina/o, Asian, and Native American communities. Other branches include FemCrit (critical race feminism) and WhiteCrit (critical White studies). While FemCrit promotes gendered analysis and feminist critiques of racism and classism, WhiteCrit exposes and problematizes White privilege to challenge racism (Yosso, 2005).

During the 1990s, CRT was introduced to the field of education (e.g., Ladson-Billings & Tate, 1995), addressing racial inequalities in educational policies, curriculum, instruction, and funding. A number of publications have appeared in such journals as *International Journal of Qualitative Studies in Education*, *Qualitative Inquiry*, and *Race Ethnicity and Education* and in edited books. In applied linguistics, research focused on race in general began to appear in the 1990s—for example, Amin (1997) examined ESL (English as a second language) students' conflation among Canadians, White people, and native speakers of English; and Ibrahim (1999) studied through ethnography a Canadian high school in which African immigrant youths *become* Black in discursive practices—but an explicit focus on CRT did not appear until the late 2000s (e.g., Kubota & Lin, 2006, 2009; Michael-Luna, 2008).

Tenets of CRT and Application to Research

Basic assumptions of CRT, summarized by Delgado and Stefancic (2001), lie in the recognition that racism is an ordinary part of everyday life, deeply ingrained in social structures; racism benefits the racially dominant group socially and economically, while disadvantaging others; racial categories are social invention; forms of racialization and racism are not static but in flux; each racialized group is always heterogeneous; and unique voices of people of color expressed through storytelling can expose hidden forms of racism.

In the field of education, Solórzano and Yosso (2002) discuss critical race methodology as an approach to research grounded in CRT. They list the following five perspectives: (a) the intercentricity of race and racism with other forms of subordination, (b) the challenge to dominant ideology, (c) the commitment to social justice, (d) the centrality of experiential knowledge, and (e) the transdisciplinary perspective (2002, pp. 25–6).

First, consistent with Delgado and Stefancic (2001), critical race methodology situates race and racism at the center of inquiry. At the same time, it recognizes the importance

of focusing on the intersectionality between the idea of race and other social categories including gender, class, language, nationality, religion, sexual identity, and so on. This allows any inquiry to be multifaceted and complex. Second, the modernist master narrative that privileges objectivity, neutrality, and colorblindness needs to be called into question and uncovered as to how it silences and distorts the experiences and perspectives of people of color. Third, research in this framework aims to eradicate not only racism but other kinds of oppression such as sexism and poverty. It promotes empowerment and social transformation. Fourth, lived experiences of people of color are exposed explicitly through such tools as “storytelling, family histories, biographies, scenarios, parables, *cuentos*, *testimonios*, chronicles, and narratives” (Solórzano & Yosso, 2002, p. 26). Finally, critical race methodology uses historical and contemporary analysis of the effects of racial, gender, and class injustices on people of color by drawing on multidisciplinary methods of ethnic studies, women’s studies, sociology, history, law, and so on.

The fourth component above is elaborated as *counter-story* or *counter-storytelling*, which is defined as “a method of telling the stories of those people whose experiences are not often told (e.g., those on the margins of society)” and “a tool for exposing, analyzing, and challenging the majoritarian stories of racial privilege” (Solórzano & Yosso, 2002, p. 32). Counter-stories can be classified into personal stories or narratives (autobiographical reflection of oneself), other people’s stories or narratives (stories told in a third person voice), and composite stories or narratives (stories involving two or more composite characters based on multiple data—see for example Solórzano & Yosso, 2001) (Solórzano & Yosso, 2002, pp. 32–3). In these counter-stories, racism, sexism, linguisticism, classism, and other forms of injustice are woven together to expose the voices of people of color that have been silenced in the past, challenge the privileged majoritarian narratives, and provide alternative understandings of the society experienced from the margin.

CRT in Applied Linguistics

In applied linguistics, basic assumptions of CRT constitute a guiding principle of the volume edited by Curtis and Romney (2006), which is a groundbreaking collection of personal narratives written by scholars in the field of English-language teaching. Works included in Kubota and Lin (2006; 2009) and some other publications also draw on CRT as a conceptual foundation. These publications address such topics as (a) racial and linguistic discrimination against English teachers of color and (b) the racialization and racism experienced by ESL students of color.

First, counter-stories told by English-language teachers of color, whether native or non-native speakers of English, demonstrate how race, ethnicity, nationality, language, accent, and gender intersect each other to shape their experiences in employment, teaching, and everyday life. Because of the transnational nature of the field of second language teaching, experiences recounted by these professionals reveal injuries of racism not only in the United States, which is a context CRT has traditionally focused on, but also on the global scale.

One significant issue revealed in the counter-stories in Curtis and Romney (2006) is that the construct of the native speaker of English, which has been problematized as exerting hegemonic power in the scholarly field of teaching English, is actually associated with middle-class Whiteness in many contexts. This intersection produces discrimination in employment and classroom teaching not just for non-native English-speaking professionals but also for native English-speaking teachers of color.

This discrimination is deeply rooted in racism against people of color that can be found in many parts of the world. Indeed, narratives told by professionals of color and qualitative research, such as a study on Brazilian people’s perceptions of the images of race

depicted in English-language textbooks (Taylor-Mendes, 2009), reveal that essentialized images of racialized groups, such as Blacks associated with people in poverty, criminals, and athletes, as well as a racial hierarchy of power, are endemic in discourses around the globe, shaping the race-based beliefs among students, teachers, parents, and administrators in EFL (English as a foreign language) contexts. This problem is partially caused by institutional racism that prevents professionals of color from taking teaching and leadership roles, creating a vicious circle of racism.

Second, some qualitative studies have focused on experiences of racialization among students to expose symbolic violence or hidden psychological injuries. For example, while East Asian students in White-dominant societies are typically constructed as the model minority, many are exposed to blatantly racist acts by some of their peers while growing up, or feel pressure to be racially and linguistically assimilated into the White mainstream group to the point that they look down upon their Black peers (see in Kubota & Lin, 2009). Furthermore, events such as 9/11 fuel an existing racial/religious prejudice—Islamophobia—and shape victimized or oppositional subjectivities among Arab international students in the Western world.

The unmarked dominant group in assimilationist racism is not, however, always White. For example, the unmarked dominant group in a high school in Hawaii is constituted by locally dominant students of Asian origin who oppress Micronesian newcomer students, producing a racial and linguistic hierarchy of power even within an ESL classroom (Talmy, 2010). Furthermore, the formation of racial identity is highly contextual. A Latina secondary school student, for instance, might aspire to take on an African American identity as a “cool” and oppositional category in terms of race and language. These examples warn against essentialist and static views of racial and linguistic identity in research.

Beyond research directly or indirectly inspired by CRT, the field of second language education, including ESL, EFL, bilingual, heritage, and foreign-language education, has investigated race, racialization, and racism in pedagogical contexts. Some research has focused on students’ engagement in anti-racist pedagogies and investigated through classroom observations, oral and written discourse analysis, or interviews how students raised their awareness of different types of racism. Other studies focus on textbooks or teaching materials and analyze how the content addresses racial, ethnic, and linguistic diversity (Herman, 2007) or how a certain material influences students’ racial identity (Michael-Luna, 2008).

Race and racism are also topics of investigation in the field of discourse analysis, as seen in the seminal work of van Dijk (1987). Through analyses of texts, interviews, and conversations, researchers have investigated the ways in which the superiority of Whiteness is legitimated, racism is explicitly and implicitly expressed, and people co-construct racist discourse in casual conversations. Although this research framework shares a focus on race and racism with CRT, the main purpose is not to expose the experiences of people of color in order to challenge the master narrative and transform existing power relations, but rather to investigate and illuminate the linguistic and discursive mechanism of racialization and racism.

Critiques of CRT and Responses

Although CRT is a powerful framework that goes beyond the normative White, Eurocentric, majoritarian epistemology, it has been criticized from several fronts, as delineated by Duncan (2005). First, critics argue that CRT fails to demonstrate how it is fundamentally different from existing scholarship, including such liberal traditions as feminist critique, in analyzing subjugated voices as opposed to dominant ones. Second, CRT is prone to be

oblivious to the diversity of the voices of the racially oppressed, especially the gap between privileged scholars of color and underprivileged people of color. A third critique is that the method of storytelling is one-sided and lacks the objectiveness required for social science research. Fourth, from a Marxist perspective, CRT is critiqued for its overreliance on race over class, a category entrenched in the political economy of capitalism, thus different from other social categories, and in need of special attention in the analysis of racism (see Kubota & Lin, 2009). In response to these criticisms, Duncan (2005) offers a solution in *critical race ethnography*, which incorporates diversified data from multiple sources, such as interviews, observations, documents, and statistics, supporting stronger claims about distinct experiences of people of color in relation to broader material conditions.

One unresolved question concerns who is entitled to use CRT to represent the voices of people of color. Hayes and Juárez (2009) offer a cautionary narrative, in which a well-meaning White teacher educator interested in learning to use CRT could substitute issues of race with social class through a colorblind lens and at the same time gain rewards for advocating for racial minorities. Even when researchers of color study the experiences of people of color from within, what is the responsibility of the researcher beyond exposing the voices of the oppressed (Lee & Simon-Maeda, 2006)?

CRT as well as general inquiry into race and racism is still at an early stage of evolution in applied linguistics. Further interdisciplinary research would expand scholarly understandings and praxis for social transformation.

Critical Theory and Literacy

BARBARA COMBER

Introduction

Critical theory is typically referred to in the singular, but the term refers to multiple theories coming from different disciplinary traditions, which compete with each other for dominance and engage in debates about their relative explanatory power. It is concerned with understanding how power relations are produced and how they might be transformed. Critical theory champions both analysis and action, with clear intentions for justice, aiming for understanding and change (Young, 1998). Historically critical theory has its genesis in the 1920s in the German philosophical tradition of the Frankfurt school, but critical theory continues to evolve, each iteration addressing the shortcomings of predecessors.

While protagonists may contest the label, many feminist, multicultural, postcolonial, poststructuralist, indigenous, environmentalist theories are clustered within the family of “critical theories” in their allied interrogation of the politics of everyday life. Some emphasize economic power; others the gendered, racial, religious, or sexual underpinnings of social, cultural, and political relations. In terms of literacy, critical theories associated with multiculturalism, cultural-historical approaches, policy analysis, linguistics and semiotics, development and learning, and feminism continue to have an impact. Key refrains echo across these bodies of work—consciousness-raising, reading against the grain, reading the word and the world—and vocabularies—ideology, deconstruction, critical discourse analysis, empowerment, identity, voice, and dialogue—that signal the politics of literacy.

Questions about knowledge are important for literacy studies—how knowledge is produced and represented and by whom. The emergence of anthropological, ethnographic, sociolinguistic, and qualitative research into literacy led to new questions for inquiry, new approaches, and new insights. The categories underpinning research on populations came under scrutiny. Key critical moves were from assumed provable certainty about the way things are; to deep troubling about the inequities of the way things are and responsibility to make a difference; to contestation that researchers even know where and how to look or how to name the problems which they purport to study.

Critical theory changed how literacy is understood, how it is studied, and the design of literacy pedagogies. The question of what constitutes literacy is discussed first in this entry, drawing insights from selected critical scholars whose work has historically been proven to be internationally significant. A discussion of competing explanations of unequal outcomes of school literacy learning follows. More recent critically oriented literacy studies, informed by Foucault and Bourdieu, are considered. To conclude, ongoing challenges faced by critical theorists are outlined.

What Constitutes Literacy?

Until the middle of the twentieth century the term “literacy” was not in common use. Initially, “literacy” (or, more likely, “illiteracy”) was used in adult education or with reference to the needs of the developing world. Literacy also featured in discussions of the

2 CRITICAL THEORY AND LITERACY

conditions under which different racial groups could immigrate to Western nations (Lake, 2005). Literacy was construed as a unilateral functional skill to be mastered. Illiteracy was seen as a deficit and blamed on the people so diagnosed. Literacy was also set up in opposition to orality, with literate cultures seen as more developed than those of oral traditions. Critical theory disputed and complicated these assumptions.

The impact of Brazilian scholar Paulo Freire in the 1960s and a number of seminal anthropological studies of reading, writing, and communication practices (Heath, 1983; Street, 1984) undertaken in the 1970s and 1980s shifted attention toward the sociocultural and political nature of literacy. Questions such as who had access to which forms of literacy practices, and to what ends, began to be raised in relation to race, ethnicity, gender, and class, and later with respect to sexuality and locality. The New Literacy Studies (Barton, Hamilton, & Ivanic, 2000) and critical sociological studies have continued these lines of inquiry into contemporary practices of multimodal and digital literacies.

Four critical educators are discussed here: Paulo Freire, social activist and literacy educator of adult workers in Brazil; Sylvia Ashton-Warner, early childhood educator of Māori children; Brian Street, ethnographer of literate practices in different cultures and communities; and Harvey Graff, historian of literacy myths and legacies.

Freire argued that people need not only to read words, but also to read the world (Freire & Macedo, 1987). He insisted on the importance of critical analysis of the organization of contemporary life. Literacy should transform workers' lives and reposition teachers as "cultural workers." Literacy would reorient the alienated masses, overcome cultures of silence, develop a critical consciousness, and liberate workers from dominant ideologies and oppressive practices. Reading was a political, not an academic, utilitarian, cognitive, or romantic activity (Freire & Macedo, 1987; Lankshear & McLaren, 1993).

Preceding Freire's (1972) *Pedagogy of the Oppressed*, Sylvia Ashton-Warner was teaching Māori children to read in New Zealand. Delays with publication of *Teacher* (Ashton-Warner, 1963) did not prevent it impacting on Freire, who acknowledged her approach to "generative words"—vocabulary that assists children making a cultural bridge to school learning.

Ashton-Warner (1963, p. 33) stated: "First words must have intense meaning for a child . . . Pleasant words won't do. Respectable words won't do. They must be words organically tied up, organically born from the dynamic life itself."

Influenced, like Freire, by critical psychoanalyst Erich Fromm, Ashton-Warner insisted on the psychological aspects of learning to read, leading her to question the normative class and cultural assumptions of early texts. Literacy acquisition was no straightforward mechanical task, but a deeply emotional, sociocultural experience. Hence she argued that "a Maori child should begin his reading from a book of his own colour and culture" (Ashton-Warner, 1963, pp. 33–4). Her attention to critical dialogue between learners, teachers, and texts highlighted the social, cultural, and political nature of early literacy.

Studies of cross-cultural differences in literacy revealed a multiplicity of situated practices; hence the singular construct, "literacy," as the collective label for reading and writing skills, became a problem. Reflecting on his 1970s research in a mountain village in Iran, Street (2001) realized that literate practices were integral to relations of everyday life and commerce. An "autonomous" view of literacy (as a set of skills with supposedly predictable benefits) ignores the ways in which people go about reading and writing to accomplish specific social, religious, and economic goals—practices that may remain invisible to Western observers. Street's "ideological model of literacy" drew upon cultural anthropology, history, critical and literary theory to understand the uses different people make of literacy.

Taking a historical approach to literacy, Graff (2001) identified myths about its assumed benefits. He showed how difficult it is to change practices that are historically embedded, how complex literacy is conceptually, the non-neutrality of literacy, the impact of schooling

on literacy, the dangers of dichotomies (such as oral and literate), the importance of motivation in literacy learning, the historical fact of multiple pathways to literacy learning, and the lack of predictable relationships between mass literacy and economic development. Graff warned: "History holds powerful lessons in disappointment and misplaced expectations. Critical literacy needs to learn from those lessons" (2001, p. 13).

He reviled "the newly proliferating literacies"—the tendency to describe everything as literacy—emotional, moral, environmental, food literacy, among others (Graff, 2001, p. 7). Yet he did not dispute the fact that there are many literacies, including alphabetic, scientific, spatial, visual and aesthetic, and argued that educators need to "expand our understanding of communicative contexts and channels in sociocultural contexts" (Graff, 2001, p. 15) through an interdisciplinary program.

Following engagement with critical theory, literacy was understood as historically, culturally, and socially situated practices and was no longer seen as a universal skill through which all populations benefit equally. As literacy programs are ideologically underpinned by particular worldviews, the extent to which communities take up various literate practices is contingent upon their being able to adapt them to their own interests (Street, 2001).

Literacy and Unequal Outcomes: Insights From Ethnographies of Schooling and Families

Ashton-Warner anticipated the consistent finding that, in the developed world, poor, marginalized, and English as a second language learners do less well with school literacies. Internationally lower levels of literacy achievement among disadvantaged student populations have been consistently documented. Decades of research into school literacies in English-speaking education systems has addressed this phenomenon, contesting deficit explanations, which claim that these children (or their families) are deficient and therefore not educable. This explanation is clearly anathema to critical theorists as it blames those with limited power and different cultural and linguistic capital for what they cannot automatically access and display. Three alternative critical explanations for unequal performance have emerged:

- the difference explanation, which argues that these children have different knowledge and language practices than those valued by schools;
- the "structural inequality" explanation, which argues that schools reproduce the inequalities which already exist within the population; and
- the "resistance" explanation, which argues that nonmainstream students actively resist White middle-class schooling.

The Difference Explanation

A key move against the dominance of deficit discourses has been work around the construct of "difference." According to this explanation, children from disadvantaged communities have difficulties with school literacy when their home language and literate practices differ from those required at school. It was not that such students lacked experiences or facility with language but that there was a discontinuity between school and home practices (Heath, 1983; A. Luke, 1993).

Heath's seminal study paved the way for school and family ethnographers of literacy internationally (see Hull & Schulz, 2001). Heath (1983) found that the language and literacy practices of three different communities varied in patterns that related to class, race, and religion. Children whose home language and literate practices matched most closely

those of the school were advantaged when it came to school literacy. Heath went beyond analysis to action in training a group of teachers and students as ethnographers to examine how the language and literate practices of their communities might be considered as learning resources. Ethnographic methods became a pedagogic tool for teachers and students exploring language difference.

Following Heath and Street, the significance of context of situation, the non-neutrality of texts, language choices, and school expectations for student display continue to underpin research designs in literacy studies (Barton et al., 2000). Many researchers working with similar theoretical resources, especially Bakhtin, explored the social nature of children's appropriation of school and community texts (Dyson, 1989; Hicks, 2002). Such theories provided new directions about where to look, what to look and listen for, and the kinds of questions that should be asked about literacy events.

Yet Heath's work, and similar ethnographies, has been critiqued in terms of its optimism, overstating the case for literacy, limited theorizations of class, and whether calling attention to difference addresses unequal power relations and systematic inequalities.

The Structural Inequalities Explanation

If students were disadvantaged by their home experiences (as both deficit and difference arguments assume) and simply needed more instructional time, one would expect that the performance of children who were disadvantaged at the beginning of schooling would gradually "close the gap" over time. However, more schooling increases, rather than reduces, the gap, giving rise to the hypothesis that there are structural inequalities through which the educational systems construct inequitable opportunities and outcomes (Anyon, 1981; Connell, 1993). According to this explanation the structures and assessment practices of schools, educational bureaucracies, and credentialing authorities ensure that privileged students are rewarded for the resources, competences, and practices they access at home and disadvantaged students are classified as poor performers and receive a watered-down curriculum. Institutional practices such as streaming or ability grouping can maintain different positions and ensure that disadvantaged children get differential treatment. At key transition points children are assessed in ways that determine both current placements and possible futures and these assessments are made on the basis of norms constructed from the "ruling class" (Freebody, 1992). Schools, departments of education, and credentialing bodies assess individuals in ways that authorize mainstream, White, middle-class Standard English, ensuring that children's linguistic resources are differentially valued.

Reading instruction received by children in different ability groups varies in quality. Typically, children in "high ability" reading groups read whole texts, focus on enjoyment and understanding, and are asked challenging questions, whereas children assigned to the "low ability" group (often students from disadvantaged backgrounds) focus on words and word parts, are interrupted more, read much less, and are asked literal questions (A. Luke, 1993).

Given that available resources construct different possibilities for literate activity, one other indicator of structural inequalities can be seen in the contrastive circumstances of schools—where they are located, how well they are resourced (libraries, ICTs, sports fields, staff, volunteers, etc.), and the well-being of the community they serve. Poor schools can raise less money from their communities and consequently they may have poorer quality equipment, buildings, and amenities. Yet poor schools have more welfare-related and curriculum modification work to do in order to meet their community needs (Thomson, 2002).

According to the structural inequality argument, schools in Western nation states are the product of White, middle-class, capitalist societies which privilege White, middle-class

competitive knowledges and literacies and exclude other practices. It follows that schools will sort and select students for life futures that maintain the inequities on which such economies function. Yet explanations that constitute educational institutions as sites of cultural reproduction may downplay students' agency.

The Resistance Explanation

Not all researchers characterize disadvantaged children as the victims of their families or of powerful education systems. In the sociological tradition of Willis (1977), some literacy researchers theorize that certain groups of "minority" students resist what school systems have to offer in order to protect their own identities in relation to their peers and communities (Giroux, 1983; Christie, 1989). They may perceive that they have more to lose by conforming to mainstream ways of being, speaking, and doing than they stand to gain. No guarantees come with scholastic achievement but there may be immediate negative community consequences that impact on students' identities and social lives.

Nonmainstream children, Gee (1990) argues, have difficulties with dominant discourses because they conflict with the values and viewpoints of their primary discourses. Schools require children to use new language in new ways. In the Australian context, Christie claims that, "In order to preserve their Aboriginal identity from the intrusion of individualistic European teaching methods, Aboriginal children everywhere have been actively resistant to learning to read and write" (Christie, 1989, p. 28). Ogbu argues that schools need to "develop programs to help these minority children learn how not to equate mastery of school culture and language with loss of group identity and security" (Ogbu, 1985, p. 868). Literacy programs need to be constructed with input by the communities they serve.

Since the 1980s, critical approaches to literacy have developed, including the New Literacy Studies, critical literacy, multiliteracies, and cultural-historical approaches. A substantial body of work shows how different groups are excluded from different forms of institutionalized literate practices, but also the ways in which different people appropriate and redesign literate practices in different contexts.

Contemporary Critical Studies of Literacy

Critical and feminist research expanded among literacy scholars in the 1990s, much of it led by scholars of color, of working-class heritage, and those working in oppressive political conditions. Pierre Bourdieu and Michel Foucault provided new understandings about how power works in relationships to language, institutions, and identities; hence their theories have proven particularly generative for literacy researchers.

Michel Foucault and Literacy Studies

Foucault has been variously described as a historical philosopher, a social scientist, and a sociologist; however, his work defies labels. He studied the processes by which human beings are constituted as subjects, both through discourses associated with the human sciences (psychology, demography) and through the institutional practices of modern societies (examination, surveillance, confession). Of particular interest to researchers in literacy studies are his constructs of power/knowledge, discourse/subjectivity, and discipline/surveillance.

The use of Foucault's "tool-box" has grown as part of a broader move from psychological discourses to sociological discourses informing literacy studies (Baker & Luke, 1991). Foucault's work has been used in two main ways. First, there are studies that take a historical perspective—including both archaeological and genealogical approaches—on

the role of literacy and schooling in the formation of modern citizens. Second, there are studies using Foucauldian analytical tools in examining contemporary discursive and institutional education practices.

Studying schooling in the nineteenth century, Donald (1992) investigated how illiteracy was constituted as a problem. He tracked the production of connections between illiteracy and criminality and the school's function in maintaining surveillance of the children of the laboring poor. School literate practices do not necessarily create spaces of freedom, and can be employed as a part of the disciplinary practices of the institution, managing both teachers and students.

Carmen Luke explored the emergence of discourses on childhood and pedagogy in relation to the early printing industry, the 1525 Peasant Rebellion, and Lutheran reform. She demonstrated the use of institutional literacy to make students and teachers identifiable "visible" objects of knowledge "through the written trace left by their own writings, and by the notations made of them by their supervisors and the surveillance experts of visitations" (C. Luke, 1989, p. 126). Through the literate work of students and teachers the school acted as an apparatus for surveillance, examination, and record keeping of the population.

Taking a genealogical approach, Hunter (1988) argued that child-centered pedagogies and normative social training operate together in forms of modern literacy pedagogy, contributing to the management of increasingly diverse populations. Intellectuals have misguidedly reduced English teaching to a series of binary choices: freedom versus sophisticated social control, or personal growth versus useful skill. Given these oppositions, the teacher is seen as either transformative intellectual or as a professional with a limited set of duties and obligations.

Similarly, Patterson argued that personal response pedagogy brought the "real life of the child" into the "corrective space of the school" (Patterson, 1993, p. 66). While the rationale is that it allows students freedom to express their own meanings and that all authentic responses are equally acceptable, personal response "may be better understood as a result of the need to find alternative ways for engaging the attention and supervising the moral and ethical development of increasingly diversified secondary school populations" (Patterson, 1993, p. 66). In Patterson's analysis reader-response pedagogy is a site for surveillance.

Because schools combine detailed information on each student with monitoring of their moral conduct they can be seen as the "paradigm of modern technologies of government" (Donald, 1992, p. 12). The contention from these genealogical studies is that literacy education is part of a broad sociopolitical move to govern diverse school populations (Hunter, 1988; Patterson, 1993). Pedagogical approaches that make claims to liberating the individual can also be seen as practices in which individuals learn to govern the self and to produce themselves as proper citizens.

Allan Luke and colleagues (Luke, 1992) examined how discursive and institutional practices constructed the school literate subject. They explored the ways in which such practices exclude and include, advantage and disadvantage, different groups of school students. Foucault's work provided "a model for rethinking pedagogy as discourse and inscription" (A. Luke, 1992, p. 112). Similarly, Woods and Henderson (2010) reexamine Reading Recovery as an instance of disciplinary practice that regulates the teacher's and the child's talk, movement, and gaze around texts, where tutors are trained to watch, interpret, and regulate children's behaviors; simultaneously the tutors' pedagogical repertoires are reshaped.

Foucault's destabilizing of grand theories and truth claims is pertinent to literacy educators working for social justice, in problematizing the myth of the universally empowering properties of literacy.

Pierre Bourdieu and Literacy Studies

Bourdieu's work was informed by anthropology, philosophy, and a range of critical theory. His sociological framework allows education scholars to "address and redress . . . systematic inequities that are generated by the schools, their affiliated language-in-education policies, and their everyday practices" (Albright & Luke, 2008, p. xi). Bourdieu directs researchers to consider children's different and particular family histories (as embodied in the *habitus*) and the contrasting resources (capital) and repertoires of practices that are available to them in everyday life which they take with them to schooling and other fields.

While many researchers have engaged with Bourdieu's work to look at questions of class and school success (Reay, 1998; Lareau, 2003), it has taken some time for his work to be fully explored in literacy education, partly due to delays with translation. Scholars are now employing his rich concepts to understand how class impacts on students' success with school literacies (Compton-Lilly, 2007; Albright & Luke, 2008).

Compton-Lilly (2007) conducted longitudinal studies of Black, working-class, urban youth with a particular focus on family reading practices. Using Bourdieu's (1986) approach to capital (embodied, cultural, and social), she postulates that families have different "reading capital" that differentially position youth in terms of academic success. While some students are privileged when their capital is recognized at school, for others it remains invisible or is considered inappropriate for school reading. The effects of capital are always subject to their value in specific fields of activity.

A recent collection on Pierre Bourdieu (Albright & Luke, 2008) is organized around his concepts of field and *habitus* and explains *doxa*, reflexivity, symbolic violence, exchange and capitals, and other Bourdieusian key words in the context of literacy education. Contributors show how Bourdieu goes beyond binary accounts of agency or reproduction, and explore a range of educational phenomena—the lifelong emergence of a scholarly *habitus* across time, places, and institutions; literacy education as a discursive political field and as a cultural gift. Common to these chapters is Bourdieu's insistence upon ongoing researcher self-reflexivity. Other writers address contemporary problems facing educators—the dominance of English as the language of instruction, the incorporation of new technologies in schooling, the affordances and limits of out-of-school popular literacies for school learning—and in so doing demonstrate the versatility and depth of Bourdieu's oeuvre, while adjusting, adapting, and supplementing elements of his "heuristics" to explain the specific conditions of their contexts.

It can be misleading to give too much credit to individual theorists. Most researchers work with ensembles of theories, or "hybrid theoretical discourses" (Miller, 1996), rather than limiting their analyses to that of any one person or perspective—for example, working with Foucault and feminist theory, or Bourdieu and feminist theories, or Bourdieu and Bernstein, or Bakhtin and feminist theories.

Many critical theorists (including Appadurai, Bernstein, Bourdieu, de Certeau, Derrida, Fairclough, and Foucault) provided theoretical resources for rethinking literacy practices. Each invented concepts and forms of relational analysis of contemporary institutions and associated practices that have informed literacy studies. Feminist theory has reshaped literacy studies in ways that cannot be fully subsumed under critical theory, as it contributed distinctive policy and pedagogical interventions (Moss, 1989; Gilbert & Taylor, 1991; Davies, 1993).

Ongoing Challenges

Several challenges face educational researchers regarding the limits of what can be accomplished in and through schooling. The "emancipatory role of teachers" (Young, 1998,

p. 175) must be questioned along with the limits of what effective schools can deliver. The inequitable outcomes of mass schooling can “only be overcome in a learning *society* which privileges learning relationships in *all* spheres and sectors of society” (Young, 1998, p. 170, emphasis in original). Claims made both for the utilitarian and the utopian benefits of literacy, along with assumptions about teachers’ capacities to ensure equal outcomes for all students, need interrogation.

The language of critical theory remains exclusive and abstract (Ellsworth, 1992), hence reducing its potential to effect widespread change and recruit marginalized groups. This is ironic given its espoused political project to redress oppression and injustice. Feminists argue that the language is symptomatic of more significant flaws in critical theory, which in regard to critical pedagogy run the risk of reproducing “relations of domination” (Ellsworth, 1992, p. 91) in that people’s historical and contemporary contexts, desires, and positioning are ignored. Critical theorists must subject their own practices to stringent evaluation as they would have others do.

Developing understandings of positive discursive practices across new sites and in various modes and media is now urgent. Lam’s accounts of immigrant adolescents’ uses of technoliteracy practices to “maintain social relationships and affiliations across countries” (2009, p. 377) provides a prototype for new kinds of literacy research. Such work attests to the multiplicity of linguistic and multimedia resources deployed by youth in order to communicate across the time, space, and language constraints that often limit what teachers and students accomplish in schools. Critical approaches to multiliteracies will need to invent new frames, vocabularies, and pedagogies for changing population, communication, and pedagogical environments.

Critiques of Language Policy and Planning

THOMAS RICENTO

We need to make a distinction at the outset between language policy and planning (LPP) as a purposeful activity carried out by elected officials, ministries of government, officially sanctioned bodies (such as school boards and language academies), community groups and organizations (such as churches), businesses, and families (who may, for example, wish to maintain the learning and use of a particular language which might not be taught in the schools), and the study of language policy and planning by academics. The latter activity, especially over the past several decades, tends to be concerned “with investigating the processes by which languages and language varieties obtain particular statuses in various domains of private and public life, and how policies (whether explicit or implicit) reaffirm or attempt to modify in some way such achieved or ascribed statuses of languages” (Ricento, 2007, p. 212). In addition to analyzing (and often criticizing) the rationales and effects of language policies on various social groups and speech communities in diverse settings, academic researchers may advocate particular policies or policy directions to further particular agendas, such as increasing support (financial and political) for threatened languages, or promoting improved educational access for speakers of minority or threatened languages. In this entry, I will discuss the research and theorizing done by scholars in the field of language policy and planning and describe how this work relates directly to people’s everyday lives. Because language is imbricated in all aspects of social life, critiques of language policy and planning emanate from a variety of disciplines in the social sciences and humanities, including linguistics, critical theory, sociology, philosophy, economics, anthropology, and cultural studies, to name a few.

In recent decades a great deal of research has been conducted on the ways in which language policies, whether those policies are explicitly planned or the result of institutional practices and customs, may limit or restrict educational access, and ultimately the social mobility, of speakers of minority languages in many contexts around the world. Our ability to function successfully in society is strongly influenced by the language(s)/language variety(ies) we speak (or don’t speak). Yet, as Lippi-Green (1997) has so eloquently shown, discrimination based on language is particularly frustrating and unfair, as most people are not able to easily change the language/language varieties they grow up with. Furthermore, language is not only useful as a means of (inter)communication between people for various purposes, it also constitutes an important aspect of our identity as members of various social groups (family, community, society, nation, region, world) (Ricento, 2005a). Yet, millions of school-age children who arrive at school speaking minority languages, or “nonstandard” versions of the school language, are disadvantaged linguistically, and if they are from a sociocultural background different from the mainstream culture, they may face additional barriers to achieving academic and social success. For example, the negative effects of speaking a so-called nonstandard variety of English, for example African American Vernacular English (AAVE), in formal school settings can be devastating for young children (Rist, 1970). While schools may not officially discriminate against children who speak AAVE, society (employers, writers of standardized tests, etc.) does discriminate against speakers of AAVE, who may find they are barred from educational, career, or housing

2 CRITIQUES OF LANGUAGE POLICY AND PLANNING

opportunities based solely on the language variety they speak. While children who arrive at school speaking AAVE may develop more “standard” varieties of English, children who arrive at school already speaking (and reading) a variety closer to standard English have a huge advantage, and this advantage increases throughout their schooling career (Hart & Risley, 2003). The use of AAVE readers as a means to bridge acquisition of “standard” English has been severely criticized by many school personnel and language purists because it gives status to what they perceive to be “bad” or “corrupted” English. Yet, it is assumed (incorrectly) that speakers of AAVE should automatically acquire the dominant (“White”) variety and failure to do so is an act of resistance, or lack of motivation. Yet, how likely would it be that speakers of “standard” (White) English would be willing to acquire AAVE if the tables were reversed and AAVE were the high-status English variety in the United States?

In other contexts, students who arrive at school speaking a nonminority language, and who are schooled in that language, may also be disadvantaged. For example, in many African and Asian countries, former imperial languages such as English and French continue to have high status and offer access to superior educational opportunities, particularly at the tertiary level, even though access to education in these languages is unattainable for the large majority of the population. Despite policies that support teaching and learning in indigenous national languages in these countries, the legacy of imperialism combined with the international appeal and power of global languages, especially English, undermines such policies (Ricento, 2010). In South Africa, for nearly 50 years, the system of racially segregated schooling widened the gap between the education of Africans and Whites; for many Africans, Bantu education (racially segregated education in one of the indigenous African languages) meant inferior education, and became emblematic of the apartheid regime. As a result of this history, a deeply ingrained negative attitude toward the use of African languages as medium of instruction developed, an attitude that persists to the present day, and which disadvantages those who are educated exclusively in African languages. Another example of how the European colonial legacy continues to influence language-in-education policies is found in India. The English language assumed a pivotal position during the Raj in India (1858–1947), separating British rulers from their subjects, but also Indians who spoke English from those who did not. This legacy of division—between Indians who speak and are educated in and through English, and those who are educated exclusively in vernacular languages—persists to the present day in Indian society. According to Crystal (2003), based on 2001 census data, only one-third of one percent of the Indian population speak English as their first language (350,000 out of a total population of 1,029,991,000), while 200,000,000 use English as a second language (about 20% of the total population). Yet, even though English is clearly a minority language throughout India, those who are educated in it beginning with primary school have a decisive advantage over those who are educated through the medium of the local vernacular language. This is because the prestigious science-based disciplines at the tertiary level, such as computer science, engineering, the hard sciences, pharmacy, and medicine, tend to be available only in English. The English proficiency of students educated through vernacular-medium schooling is generally lacking at high school completion, which prevents these students from entering these professions (Ramanathan, 2005, p. 6). Ramanathan (2005, p. 35) concludes that

by validating the role of English as much as it does at the tertiary realm and beyond, the general socio-educational apparatus is also simultaneously sending out implicit messages about the generally low regard it has for the Vernaculars both within the apparatus as a medium of instruction and in the larger social world to which the apparatus is inextricably tied.

There is a clear association between social class and medium of instruction: students schooled in the vernacular in the K-12 years are typically lower-income children, while English-medium instructed children tend to be middle class and have access to better higher education and careers. Thus, in both India and South Africa, access to, and education through, the medium of English is associated with higher socioeconomic status and a better life, while vernacular languages are devalued, even though all K-12 students in India have the option of being educated in either one of India's 15 nationally recognized languages or in English (Pattanayak, 1981). The examples from South Africa and India illustrate the complex ways in which historical, political, and economic factors can limit the efficacy of government language-in-education policies which seek to promote education in the local/vernacular languages.

Another factor which has been researched by academics is the discourses of language policy and planning with their attendant ideologies about language(s) and linguistic communities. By critically analyzing the discourse of policy makers, academics, politicians, and the media, scholars such as van Dijk (1998), Blommaert and Verschueren (1998), and Fairclough (1989) have shown how discourse both reflects and constitutes societal beliefs about language(s), and their speakers. Ricento (2005b) analyzed the written discourse used by organizations that support the teaching and learning of heritage languages in the USA. He found that a prominent metaphor in the discourse was "language-as-resource," but the resource (language) was characterized as a commodity to be "cultivated" and "harnessed" primarily in serving the military, security, and economic needs and interests of the state (the US government and its agents). The interests, needs, and values of heritage language speakers and their communities were at the bottom of the list of reasons for supporting changes in policies designed to "produce" more competent speakers of strategically important languages. Discourses that represent languages as commodities tend to focus on the purely instrumental dimension of language as a tool for communication while diminishing the ways in which language(s) serve as markers of identity and transmitters of culture and history. Wiley (2001, p. 32) argues that "to ensure that heritage language programs do not merely become symbolic gestures, imposed by outsiders to the community, it is important to define heritage language programs from a community perspective."

This is not to say that the economic dimensions of languages are unimportant or irrelevant in considering their role in social mobility and the aspirations of individuals and communities. Indeed, one scholar has argued that "languages can be maintained only to the extent that they are endowed with an economic value" (Magnet, 1990, p. 295). However, as Petrovic (2005, p. 400) has noted, "many language minority communities create diglossic linguistic contexts. Their languages serve different social (and economic) functions, but the community is bilingual nonetheless." The commodification of language as a "resource" fits within the neoliberal/rational choice political paradigm which tends to support the teaching, learning, and use of the national/dominant language, or an exogenous "world language" because of its perceived economic benefits, as the exclusive language of schooling, work, and commerce. It also assumes that minority languages have limited instrumental value outside of local and community domains. The idea that languages are tied to communities, and that communities may provide "benefits" that are not easily reduced to quantifiable "goods" with market-determined value, is not factored into most types of rational choice models (May, 2001, pp. 39–40), or it is taken for granted by speakers of dominant/national languages who enjoy both instrumental and affiliational/identity aspects of their language. The prevalence and unquestioned acceptance of the neoliberal/rational choice framework in some academic and most mainstream media discourses concerned with language planning and policy renders support of minority/marginalized languages, and especially those that are associated with socially and economically marginalized groups, as misguided, a "waste of money," "romantic idealism," or unrealistic. It is for these reasons

that François Grin (2006, pp. 83–4) has argued that state intervention in language planning and policy is justified because “almost every form of market failure occurs when it comes to the provision of linguistic diversity.” If we consider the counterfactual argument, that is, a world without linguistic diversity, most people would find such a state of affairs to be undesirable. Yet, without deliberate policies to protect the status and domains of use for thousands of threatened minority languages, the likelihood that these languages will survive for very long is remote (Krauss, 1992). In addition, the intergenerational transmission of world languages with minority language status in certain territories, such as Spanish in the United States, Mandarin and Cantonese in Canada, and Hungarian in the Slovak Republic (among many other cases that can be mentioned), requires active involvement of states and their governments if those societies, as collectivities, claim or aspire to be multilingual as well as multicultural. Since the governments of most states stand to gain from neoliberal economic policies, even if their populations do not (Ricento, 2010), it has been argued that strong universal linguistic human rights (LHR) conventions and treaties must be implemented and enforced by states in order to ensure the continuation of linguistic diversity (Skutnabb-Kangas, 2007). While a number of attempts and draft documents have been developed and approved at various subnational levels, to date such LHR conventions have not been adopted or ratified by states, a reflection both of the unwillingness of states to cede any degree of their ability to control their own populations and of the continuing power and persistence of neoliberalism as the driving ideology behind globalization, with the attendant power and influence of international languages, such as English.

In the early days of research in language policy and planning a great deal of attention was focused on the national character of languages and on developing strategies to promote political integration in developing nations. Over the past two decades, there has been a greater concern with investigating the more complex yet fundamental issues dealing with language choice, individual and group identities, and socioeconomic structures and hierarchies of inequality. Borrowing from the theories and methods of critical theory (Tollefson, 2006), scholars in recent years have investigated the role of power in influencing the status of languages in society and their relative positioning mediated by social class and ascribed group characteristics, such as ethnicity, race, and gender, among other variables. One of the challenges for researchers has been to account for the relations between macrolevel structures and policies and microlevel language behavior in order to understand how macrolevel policies are taken up, resisted, or transformed by subjects in their lived experiences (Ricento, 2000, pp. 208–9). To address this gap in the literature, researchers have used the methods of ethnography combined with critical discourse analysis in a model referred to by Johnson (2009) as “the ethnography of language policy.” Hornberger and Johnson (2007) suggest that an approach that incorporates historical analyses of policy texts combined with multilayered ethnographies of policies in local contexts will help researchers and policy makers better understand why policies succeed or fail, or result in unexpected outcomes altogether.

To summarize, everyone is affected in their everyday lives by policies that involve language. Many of these policies, whether they are official and prescribed or simply the result of customs and local practices, may be considered unfair, prejudicial, or advantageous, depending on the contexts and purposes for which they apply. Language is far more than a medium for communication between individuals; it is, in fact, because language is so tied up with our identities as human beings and members of groups, societies, and nations that it is nearly impossible to devise, implement, and evaluate language policies without some degree of emotional involvement. Because language is *not* used primarily as a “conveyor belt” to transmit “thoughts” between people, policies dealing with language can never simply be about efficiency and practicality. The fact that there are between 5,000 and 6,000 named oral languages in the world today is testament to the

fact that humans *value* difference, and language is one of the primary means by which we establish who we are, and who we are not.

Cross-Cultural Pragmatics

STEFANIE STADLER

“Pragmatics” refers to the study of language in action. As such its focus is to explore the meaning an utterance acquires on the basis of the social and situational context in which it is embedded. One of the many concerns of the field of pragmatics is that linguistic knowledge—such as knowledge of grammar and vocabulary—alone is insufficient for interacting across cultures. Instead, the field asserts that the meaning of an utterance cannot always be interpreted in a literal manner, but depends on the context in which it occurs. An example that is frequently used to explicate the aim of the field of pragmatics is as follows:

A: What time is it?

B: The milkman was just here.

The answer to this question does not per se tell the other person what time it is and is entirely meaningless to an outsider. However, within a social context where there is such a thing as a milkman who delivers fresh milk to people’s private homes on a daily basis (for example in the UK), this answer indicates an approximate time. It does so by assuming the shared contextual knowledge that the milkman delivers the milk each day at 8 a.m., for example. Though B’s answer does not relate directly to A’s question, it allows A to infer meaning from its contextual embedding.

It can thus be said that the field of pragmatics is in part concerned with how context contributes to the meaning of an utterance and with how to interpret the literal meaning of an utterance based on its contextual referencing.

“Cross-cultural” literally means between cultures, hence, on a literal level “cross-cultural pragmatics” refers to the study of meaning negotiation between different cultures. While the term “cross-cultural pragmatics” is sometimes used to refer to precisely this kind of research, more and more frequently a clear distinction between the terms “cross-cultural” and “intercultural” is being made. Though these terms are often used interchangeably, it is useful to distinguish between them. The term “cross-cultural” refers to exploring how natives speak and act in their native language and within their own cultural context and comparing how native behavior in one culture compares with that in another culture. This definition of cross-cultural therefore does not refer to the exploration of issues relating to people conversing across cultural boundaries—as the literal meaning of the term suggests—but rather the exploration of issues pertaining to *intracultural* communication. Cross-cultural pragmatics adopts a comparative methodological approach which contrasts the findings of the characteristics of intracultural communication in two different cultures by identifying similarities and differences in their (speech) behavior. Findings of this investigative framework add to our knowledge base on a cognitive level by highlighting cultural differences, their underlying causes (e.g., values and norms), and their manifestations as they emerge through speech. However, cultural differences identified through cross-cultural inquiry are not necessarily an adequate predictor for communicative situations when people from different cultures interact with one another, as people often adopt different behaviors when talking to strangers than when interacting with people from their

2 CROSS-CULTURAL PRAGMATICS

own cultural background. This is where the field of intercultural pragmatics takes over. The term “intercultural” is used to clearly emphasize that research of this nature focuses on interactions between members of different cultures. Intercultural discourse focuses on the complexities that arise from interactional partners approaching a communicative situation with different sets of rules, norms, expectations, and assumptions. It unearths common pitfalls and causes for miscommunication and takes an interest in how to resolve communicative problems deriving from cultural differences.

The field of cross-cultural pragmatics can thus be said to investigate the speech behavior and norms of different cultures, focusing on contextually derived meaning, the appropriateness of language usage in differing cultural contexts, and the complexities and challenges tied to the acquisition of pragmatic competence. According to Alcón and Safont Jordá (2008, p. 193), pragmatic competence requires “knowledge of those rules and conventions underlying appropriate language use in particular communicative situations and on the part of members of specific speech communities.” Pragmatic competence entails both the ability to produce an utterance that is meaningful and appropriate to the social and contextual setting in which it is produced and the ability to correctly interpret someone else’s message by inferring the intended meaning. Hence, this field of study is equally concerned with meaning construction (i.e., the speaker’s contribution) and meaning interpretation (i.e., the addressee’s contribution) of a message exchange, although there is a stronger focus on productive skills than on perceptive skills.

The most prominent field of research investigating meaning interpretation is the study of conversational inference. Studies in this area are not necessarily tied to specific speech events and this distinguishes them from most other types of studies into cross-cultural pragmatics. In the subsequent section on conversational inference I will briefly outline the areas of interest and foci in this line of investigation on discourse-generic inquiries. As it is difficult, if not impossible, to categorically compare the entire speech behavior of one culture to that of another, pragmatics studies typically focus on very specific communicative situations. In the sections on speech act theory and politeness theory I will discuss the application of pragmatic inquiry into such specific speech situations and contexts. Though both types of pragmatic studies differ in the breadth of their investigation focus, they are united by a shared goal. What both lines of inquiry have in common is the overarching notion that language largely obtains meaning from the context in which it occurs and that intended meaning can only be derived by taking the social, situational, and cultural context into account. In the last section on applied language studies I will provide an insight into what is arguably the most praxis-oriented line of inquiry in the field of pragmatics. This area of pragmatics takes an interest in both context-generic and context-specific aspects of pragmatics and explores the impact of pragmatics on a learner’s performance in his or her target language and the importance of the integration of pragmatic knowledge into the language classroom.

Conversational Inference

Conversational inference denotes the ability to extricate the intended meaning from the literal message. According to Spencer-Oatey and Franklin (2009, quoting Thomas, 1995, p. 1), “people do not always or even usually say what they mean.” In other words, it is more common for the intended meaning to be hidden than to be expressed clearly. Conversational inference is thus the listener’s ability to read between the lines and draw the hidden meaning from the speaker’s utterance. Gumperz (1992, p. 230) describes inferencing as “hypothesis-like tentative assessments of communicative intent, that is, the listener’s interpretation of what the speaker seeks to convey.” For this, listeners need to

rely on background assumptions and draw on extralinguistic “knowledge of the world.” We derive this knowledge from “our customary ways of being in social situations,” as Scollon and Scollon (2001, p. 12) put it. That is, conversational inference is not so much a process of conscious reflection and analysis, but more a habitual response to the social situations we are used to encountering based on our upbringing in a certain cultural and social setting. Because what people say, how they say it, and how what is said is being interpreted is influenced to such a large degree by the cultural background of speakers and addressees alike, studies on conversational inference often focus on cultural aspects.

One of the most famous approaches relating to conversational inference is that of the notion of context levels. Hall (1976) and Hofstede (2001) assert that people can be said to belong to either low-context cultures or high-context cultures, with low-context cultures expressing meaning explicitly and only relying on contextual inference to a minimal degree. High-context cultures, on the other hand, rely heavily on the ability of the listener to draw meaning from the context and attribute intentions by drawing on contextual cues. It is for these latter types of cultures that conversational inference is an indispensable communicative tool. The stark difference in practice of meaning transfer and meaning interpretation in different cultures is what makes this line of inquiry so attractive for cross-cultural comparisons and thus makes it a main element of the field of cross-cultural pragmatics.

As a consequence, this strand of cross-cultural pragmatics is dedicated to unraveling how utterances are intended and interpreted in the cultural context in which they occur. It seeks to explore the relationship between message uttered and message received. Studies that combine a focus on conversational inference with a cross-cultural pragmatic approach further aim to shed light on different cultural practices, and the extent to which people rely on the listener’s ability to uncover intentions. It strives to understand what prompts people from one cultural background to interpret the same message differently to someone from a different cultural background and what problems this can cause for people engaging in communication across cultures.

Speech Act Theory

Speech act theory forms the main platform for cross-cultural pragmatics and is frequently pursued in connection with other lines of inquiry. In contrast to conversational inference, speech act theory focuses exclusively on specific speech events, the so-called “speech acts.” The term “speech act” refers to Austin’s (1962) notion that language is as much a mode of action as it is a means of conveying information (Henderson & Brown, 1997). Speech acts are verbal messages that, through the very action of being uttered, perform a certain function. According to Searle (1969, p. 16), all linguistic communication involves speech acts and these form the basic units of communication.

Cross-cultural speech act studies are, according to Gass and Neu (1996, p. 1), based on the assumption that “speech acts are realized from culture to culture in different ways and that these differences may result in communication difficulties that range from the humorous to the serious.” The speech acts that received the most attention include compliments, apologies, refusals, requests, greetings, complaints, and disagreements. This area within cross-cultural pragmatics started in the mid-20th century, with its inception being strongly linked to the names of John Austin and John Searle. In its infancy, this area was more strongly tied to philosophy, but is now firmly anchored in linguistics. While it experienced its heyday in the early 1980s, it is still being pursued actively to date, as speech act theory forms a valuable platform for many different types of investigation. The popularity of this branch of studies saw projects emerge that dedicated their attention entirely to the study of speech acts in a cross-cultural setting, most notably the CCSARP (Cross-Cultural Speech

Act Realization Project), consisting of renowned researchers in the field of pragmatics and second language acquisition. Research in this field of cross-cultural pragmatics aims to explore the ways in which certain cultures typically express a certain speech act. Each culture has preferences as to how a speech act is performed in line with the attributes a culture values. One such attribute is the level of directness/indirectness that is appropriate for the particular situation, the speaker, the addressee, and the general contextual setting. Different cultures have different rules and norms as to what constitutes appropriate levels of directness in a particular speech event. This is especially true for potentially offensive speech acts, such as complaints, or speech acts that impose on the addressee, such as requests (see Stadler, 2002). These are therefore often produced in a very subtle manner, relying heavily on the skills of the addressee to attribute meaning to the utterance and detect the clues for the real intent behind a speech act. It can be very difficult for addressees to understand the intended meaning, not just for conversational partners from a different cultural context, but sometimes even for people that share the same cultural background. Because successful communication requires that the message and meaning intended by the speaker is correctly received and interpreted by an addressee, sustainable error-free communication is rare, both within a culture and between cultures (Dattner, 2004). However, it is not only difficult to interpret the intended meaning of a speech act, it is also difficult to produce a speech act in the language and manner that are appropriate to the social and situational context. Countless studies have highlighted the problems connected with the acquisition and implementation of such pragmatic knowledge (Cohen & Olshtain, 1993; Stadler, 2002).

Speech act research thus tries to identify what is appropriate behavior when expressing a speech act in a particular culture and how to appropriately detect the intended meaning. Cross-cultural speech act research does so by means of comparison, where differences and similarities are identified in the realization of a particular speech act in different cultural contexts.

Politeness Theory

Cross-cultural comparative studies have also been prominent in politeness research. The issues of directness and indirectness that feature prominently in speech act studies also play a central role in politeness theory. Although this issue has been hotly debated and contested in more recent years (Meier, 1995), indirectness had traditionally been linked to politeness, while directness had been linked to a lack thereof (Brown & Levinson, 1987; Lakoff, 1990). This proposed connection between the level of directness employed in speech acts and the level of politeness has resulted in the fact that speech act theory and politeness theory have become closely interlinked and are often pursued in a joint endeavor.

The most famous study to have been written in this field is Brown and Levinson's 1978 and revised 1987 contribution. Although their study has received criticism, it set a useful cornerstone in politeness theory. Many of these early studies have drawn generalizations on presumably universal politeness trends, but have subsequently been criticized for stereotyping cultural trends, partly because the so-called universals were heavily based on Western cultures and did not necessarily apply to Asian cultures (see Gu, 1990). As a consequence researchers have moved away from universal politeness trends and have focused on cross-cultural inquiries into cultural differences in politeness behavior. This has resulted in the findings that people do not always strive for harmony and that politeness behavior is strongly tied to cultural preferences. While some cultures, such as Anglo-Saxon cultures, lean more toward maintaining harmonious and friendly relations in most contextual circumstances, other cultures enjoy heated debates and deliberately employ

strategies that encourage disagreement rather than consent (including many Southern European cultures, South American cultures, German and Jewish cultures). This has resulted in the emergence of impoliteness theory studies (see Culpeper, 1996).

The main aim of cross-cultural politeness research is very similar to that of speech act theory, namely to identify differences and similarities in the way politeness is expressed in different cultures and to establish to what degree politeness is valued in a particular society in relation to other values.

While these lines of inquiry focus on identifying differences and similarities in the way that different cultures express and interpret certain conversational goals through language, applied language studies focus on what it takes to acquire the knowledge of how to communicate effectively and appropriately in a non-native language and cultural context.

Applied Language Studies

This area within cross-cultural pragmatics is strongly tied to education and aims to promote the teaching of pragmatics in the language classroom. The claim is that language instruction places too strong an emphasis on the acquisition of linguistic knowledge, thereby overlooking the importance of the acquisition of pragmatic competence. Language instruction has traditionally been largely focused on the transmitting of knowledge of grammar, lexis, pronunciation, orthography, and so forth. However, not only can interaction sometimes be a marginalized component of language acquisition, but what little conversational practice takes place often occurs in a largely decontextualized environment. As a consequence, when language learners do eventually get confronted with interactions in the target culture, they fail to communicate their intentions appropriately. This is due to a phenomenon known as pragmatic transfer, which refers to language learners applying the conversational rules and norms of their own culture and language to the target language. The consequences are all too often communication failure and miscommunication, if not negative cultural stereotyping. In order for learners to overcome such negative pragmatic transfer, they need to acquire pragmatic competence in the target language.

Ellis (1997) regards linguistic competence as a prerequisite for pragmatic competence, as it is necessary to master the required level of grammar and lexis in order to be able to express different levels of subtlety. However, linguistic proficiency in no way guarantees pragmatic competence (see Cohen & Ishihara, 2005). Studies investigating the acquisition of pragmatic knowledge have shown that students with otherwise excellent language skills lack pragmatic competence (Stadler, 2002). Pragmatic competence entails the knowledge of when it is appropriate to say what to whom in another culture, and the rules for that can be complex and subtle, making them particularly difficult to acquire. Unlike grammar, pragmatic knowledge cannot be pinned down to precise rules, as no two people from the same culture always react in precisely the same way in the same situation, making pragmatics far less predictable than linguistic knowledge. Rather, pragmatics relies as much on inference and intuition as on behavioral norms. The mastery of such competence requires sensitivity and perceptiveness on the part of the learner, combined with preparation and explicit instruction. Ellis (1997) even argues that a further element could be involved in achieving pragmatic competence, which he relates to accommodation theory. He suggests that pragmatic competence involves an element of managing the emotional response associated with certain speech behaviors, which can make it difficult to adopt a certain style that is considered inappropriate in one's native language context. According to Ellis (1997, p. 182), for Japanese to adopt a direct style of interaction would thus require "psychological convergence" on their part, a step which Cohen and Olshtain (1993) and Cohen and Ishihara (2005) report is difficult for learners to master.

Conclusions

Increasing globalization, the realization of the disastrous consequences that miscommunication entails, and the awareness that linguistic competence alone is insufficient to guarantee mutual understanding have created a pressing need to explore the cultural dimension of pragmatics. As a response to the need to gain a better understanding of how practices of meaning transfer are influenced by the cultural background of speakers and listeners, the field of cross-cultural pragmatics emerged. Its target is to explore and compare cultural practices, norms, values, and behaviors in order to better inform the needs of practitioners engaging in communication across cultures and educationalists who make decisions on language education policies. Cross-cultural pragmatics thus has the potential to make a valuable contribution to the practical needs of an increasingly interconnected world.

In order to better serve the practitioner sector, it would be desirable to create a better synergy between and across disciplines. Cultural aspects of communication are relevant to and explored in a myriad of different fields, including linguistics, communication studies, business, psychology, pedagogy, management, and mediation, to name but a few. Insights from the various fields, though, are largely produced for intrinsic benefits and consequently tend to be written in a manner that makes it approachable mostly (if not solely) to other people in the same field. Better interdisciplinary communication would help drive forward a mutual goal of facilitating communication across cultures. At this point in time, the value that pragmatic inquiry adds to practitioners is often understated or overlooked by other sectors. Improved interdisciplinary integration and increased accessibility to practitioners (i.e., laypeople) would help cross-cultural pragmatics to achieve the status and recognition it deserves.

Crosslinguistic Differences in Grammar

HILDE HASSELGÅRD

Comparing Grammar Across Languages

In his much-cited work *Linguistics Across Cultures* Lado (1957/1971) gives advice on how to compare linguistic and cultural systems, mainly with the aim of improving language teaching. As regards the comparison of grammatical structures, he asks the fundamental question "What does grammatical structure mean?" (1957/1971, p. 51). The answer to this question depends on educational background as well as theoretical persuasion. Lado himself regards "grammatical structure as matters of form that correlate with matters of meaning" (1957/1971, p. 52). Grammatical structure encompasses a range of phenomena, from morphology to word order, and apparently also phraseology, as indicated under the heading of "Grammatical structure, a system of habits" (1957/1971, p. 57).

The study of crosslinguistic differences in grammar may have a theoretical as well as an applied objective; typological research, for example, may aim at grouping languages on the basis of similarities in their linguistic structure (e.g., Steinbergs, 1996, p. 374) or at testing the universal grammar hypothesis (e.g., Jackendoff, 2002, p. 68). Contrastive analysis tends to be associated with applied linguistics. It is traditionally defined as "a linguistic enterprise aimed at producing inverted (*i.e.* contrastive, not comparative) two-valued typologies" (James, 1980, p. 3). According to James (1980, p. 63), contrastive analysis "involves two steps: *description* and *comparison*." Thus, although a contrastive analysis may involve more than two languages (see, e.g., Cosme, 2008), the number of languages involved is necessarily limited by the practicalities associated with the first of these steps.

Contrastive analysis is furthermore founded on "the assumption that languages can be compared" (James, 1980, p. 3). This requires a *tertium comparationis*, that is, "a background of sameness against which differences can be viewed and described" (Johansson, 2007, p. 39). The sameness may be based on either form or meaning, and may involve any level of language description. Chesterman (1998, pp. 29ff.), examining Krzeszowski's (1990) approach, lists the following types of equivalence that may serve as *tertium comparationis*: statistical, translation, system, semantico-syntactic, substantive, and pragmatic. According to Roman Jakobson, "any comparison of two languages implies an examination of their mutual translatability" (1959, p. 234), and the translation relation has indeed often been regarded as the most viable *tertium comparationis* for crosslinguistic study; see, for example, James (1980, p. 178) and Johansson (2007, p. 3).

Halliday (2002a, p. 30) emphasizes the need to "establish what categories [are] comparable" in crosslinguistic studies, as it is by no means evident that different languages have the same categories. To this end, he proposes (2002b, p. 41) that "the fundamental categories for the theory of grammar are four: *unit*, *structure*, *class* and *system*." According to Halliday, "these four, and no others, are needed to account for the data. . . they make possible . . . a comprehensive description of the grammars of languages" (2002b, p. 41). *Units* of grammatical form include morphs, words, groups, phrases, and clauses (p. 45); a *structure* is made up of elements in succession, and thus pertains to the formation of groups, phrases, and clauses (p. 46); examples of *classes* are parts of speech (with their subclasses) and

2 CROSSLINGUISTIC DIFFERENCES IN GRAMMAR

phrase types (p. 51), while the *system* provides “the final requisite for the linking of the categories to the data” (p. 53), that is, a framework for choosing (and accounting for) appropriate units, classes, and structures in a language. See also James (1980, pp. 31ff.). Units of grammar are hierarchically related and may undergo *rank shift* (e.g., clauses may be embedded in phrases). Structures constitute syntagmatic relations, while classes represent paradigmatic relations. It follows that languages may differ as to the structure of units, and furthermore that equivalent meanings may be realized by units of different classes.

Analysts may disagree over whether Halliday’s four categories are the only ones, or the most relevant ones; however, the various relations they represent are useful to keep in mind when comparing grammatical structures across languages. In such comparisons it will often be evident that languages vary, as Halliday and Matthiessen (2004, p. 9) note, “with respect to the ‘division of grammatical labour’ among the ranks. In particular, certain languages do relatively more grammatical work at group (and clause) rank, whereas other languages do relatively more work at word rank.” A similar observation was in fact made by Weil (1844), contrasting “la marche des idées” with “la marche syntaxique” in texts translated from classical languages into modern French. Thus, to return to Lado (1957/1971), “matters of meaning” may correlate with different (lexico)grammatical structures in different languages.

Some brief comments on a single example must suffice at this point to illustrate the crosslinguistic comparison of unit, structure, class, and system. (The example is from Europarl, accessed via OPUS at <http://urd.let.rug.nl/tiedeman/OPUS>.)

- (1) a. The Treaty prescribes the creation of an area of freedom, justice and security, but the Tampere summit is in danger of turning only into a security summit.
- b. Le Traité prescrit la création d’un espace de liberté, de sécurité et de justice, mais le sommet de Tampere risque de se transformer en un sommet sur la sécurité.

An analysis of examples (1a) and (1b), which are translationally related, indicates that French and English are structurally and syntagmatically similar in having the word order of SVO. Moreover, the subject noun phrase (unit) is composed in the same way (structure) with a definite article in front of the head noun. However, the class of nouns in French involves a distinction that the English noun phrase lacks, namely that of gender, which shows up in the variability of the definite article (system). The example further seems to indicate that the two languages differ as to the combination of nouns in compounds; cf. *Tampere summit* and *security summit* versus *sommet de Tampere* and *sommet sur la sécurité*. Further exploration is required to test whether this is a consistent difference between the languages or whether it is peculiar to the present example. We may also note that the English noun *danger* corresponds to the French verb *risquer*; this meaning is thus realized by different classes in (1a) and (1b).

Method and Materials for Crosslinguistic Grammatical Studies

In making crosslinguistic grammatical comparisons, as in all contrastive analysis, it is important to make sure that like is compared with like. Chesterman (1998, pp. 52ff.) proposes a method in which the linguist, examining primary data in two languages, starts from a perceived similarity between phenomenon X in language A and phenomenon Y in language B. The perceived similarity may be related to any aspect of the two languages compared. An initial null hypothesis, that X and Y are identical, can then be tested and revised until a satisfactory description is reached.

Contrastive studies of grammar are usually text-based, although other methods may be applied, such as elicitation experiments. The texts used for contrastive studies may be comparable texts in the languages compared, or they may be translations between those languages. Examples of text-based studies of word order can be found in the research of members of the Prague school, for example Firbas (1992). A number of text examples in various languages are used for illustrating the different principles that underlie word order, in particular the grammatical principle (which dominates in present-day English) and the principle of Functional Sentence Perspective (which dominates in Czech).

A rudimentary comparison of units, structure, classes, and system may be carried out on relatively little material, or on introspective data from a bilingual speaker. However, linguistic systems do not consist only of the potential choices that can be made with respect to units, classes, and structures in a language; there is also an element of probability that a certain construction will be used in particular contexts. The study of this kind of probability requires a large number of data representing a range of text types. Monolingual corpus studies have, for example, shown that grammatical choices vary across registers of language (see, e.g., Biber, Johansson, Leech, Conrad, & Finegan, 1999). Along these lines, Teich (2003, p. 27) argues that register is part of the linguistic system and moreover that some aspects of crosslinguistic variation may be “due to differences in usage conditions according to register” (p. 28). For example, she finds that the distribution of active and passive voice is different in English and German scientific writing, with the passive being more of a “register feature” (p. 181) in English than in German. This kind of information is useful in applied contrastive analysis; it is, for instance, important for translators to be able to find the appropriate style level and for language learners to produce utterances that are not only grammatically correct, but also natural and appropriate to the context of situation.

Corpus-Based Studies of Crosslinguistic Grammatical Differences

Since the mid-1990s it has been possible to study crosslinguistic differences in grammar on the basis of corpora. Corpora for contrastive analysis may be translation corpora or comparable corpora (see Johansson, 2007, pp. 9ff.). A parallel corpus is defined here as a bidirectional translation corpus with comparable original texts in both languages. A bidirectional corpus has some obvious advantages: (a) The translation relation ensures equivalence of meaning between texts in the languages compared, and (b) the researcher can control for translation effects by having access to comparable original texts in both languages (Johansson, 2007, p. 12). The comparability of the original texts in such a corpus thus takes care of the register variable discussed by Teich (2003). Teich also suggests (p. 222) that register comparability can be used as *tertium comparationis* in studies based on multilingual, non-translated material.

The most obvious disadvantage as regards the use of corpora for studying grammar is that many features of grammar are not easily searchable unless the corpus is carefully tagged and parsed. Often, “exploring grammatical phenomena in a multilingual corpus is a difficult and time-consuming task involving much manual intervention, unless there are clear lexical correlates” (Johansson, 2007, p. 37). Parallel corpus studies of grammar are thus typically—but not exclusively—focused on grammatical categories that are closely linked to lexis, such as studies of modality starting from modal auxiliaries (e.g., Løken, 2007) or modal adverbs (e.g., Aijmer, 2002). However, as these studies show, the parallel corpus methodology establishes translation paradigms (involving members of different classes), which may also turn out to be lexicogrammatical paradigms for expressing modal meaning. Examples (2)–(5), from the Oslo Multilingual Corpus (OMC; see www.hf.uio).

4 CROSSLINGUISTIC DIFFERENCES IN GRAMMAR

no/ilos/english/services/omc) may serve as an illustration: The English modal auxiliary *might* is shown to correspond to various forms of the German subjunctive ([2b] and [3b]), the present modal *kann* (4b), and the discourse particle *wohl* (5b). These correspondences thus constitute (part of) the German translation paradigm for *might*.

- (2) a. You *might* have asked her in.
b. Du *hättest* sie hereinbitten *sollen*.
- (3) a. One *might* get £300,000, but the repolisher would want his cut.
b. Dreihunderttausend Pfund *könnte* man kriegen . . .
- (4) a. You never know when you *might* need to do this, he says.
b. Man kann nie wissen, ob man es nicht einmal brauchen *kann*, sagt er.
- (5) a. Of course, now, if a big woman like you is afraid of what her daddy *might* say?
b. Wenn natürlich eine so erwachsene Frau wie du Angst hat, was ihr Vater *wohl* dazu sagt.

Correspondingly, the English paradigm arising from the translation of the German particle *wohl* includes *probably*, *perhaps*, *presumably*, *doubtless*, *surely*, *I suppose*, and constructions with modal auxiliaries and *seem*, thus consisting of modal adverbs, modal auxiliaries, a catenative, and a comment clause.

Other types of grammatical studies—of structure and system—may use a lexical starting point to investigate the division of labor between lexis and grammar in expressing particular meanings. A case in point is the well-known distinction between Germanic and Romance languages as regards the expression of manner and direction with verbs of movement (e.g., Slobin, 1996). As predicted by Talmy's distinction between verb-framed and satellite-framed languages (e.g., Talmy, 1985), Germanic languages tend to express the manner of movement in the verb and optionally path in an adjunct, while Romance languages tend to do the opposite. This is exemplified by (6a) and (6b), where the Norwegian verb *krabbe* 'crawl' denotes manner of motion (with the direction *opp* 'up' added as a satellite) and the French *monter* 'mount' denotes direction.

- (6) a. De myldret om faren hele tiden, *krabbet* opp på fanget hans og rusket ham i skjegget.
Lit: 'They crowded about the father the whole time, *crawled* up on his lap and pulled him in the beard.'
- b. Ils grouillaient sans cesse autour de leur père, *montant* sur ses genoux pour lui tirer la barbe.

Obviously, crosslinguistic studies of grammar may also start from a grammatical category that exists in two languages, and compare its function(s) and distribution. Unless the corpus used for such an investigation is both tagged and parsed, the linguist will have to resort to a combination of word class tagging, filters, and wild cards to find the relevant material. One such example is Elsness's (2003) study of the present perfect and the preterite in Norwegian and English. Although the two categories have similar expressions in the two languages and also roughly similar uses, the corpus material showed that the present perfect was more frequent in Norwegian, at the expense of preterite forms, presumably because "the verb forms express (slightly) different temporal meanings in the two languages" (2003, p. 34). Greater divergence between the two verb forms is found if more languages are added; de Swart (2007) finds great similarities between the use of the German Perfekt and the French passé composé, on the one hand, and the English and Dutch present perfect, on the other. However, the use of the German and French forms differs markedly

from that of the English and Dutch forms, as shown in (7), where the English preterite corresponds to a German Perfekt in the context of specific time reference.

- (7) a. She *bought* Scudder's Cottage when she first arrived here three years ago.
 b. Sie *hat* Scudder's Cottage *gekauft*, als sie vor drei Jahren hierherkam.
 Lit: 'She has Scudder's Cottage bought, when she three years ago here arrived.'

Similarly, Lansari (2009) studied the periphrastic future expressions *aller* + infinitive and *be going to* in French and English on the basis of a parallel corpus. These forms are similar in composition as well as meaning and are retrievable on the basis of a combination of lexically and grammatically defined search terms in both languages, even if the study inevitably reveals other expressions of future time used as correspondences. Fabricius-Hansen (2004), by contrast, investigates a linguistic category that exists in only one of the languages under comparison, namely the German reportive subjunctive, with a view to identifying any correspondence it may have in parallel texts in English and Norwegian, which lack this form.

Furthermore, the division of labor between participant and adjunct expression of circumstantial meanings may vary across languages, as argued by König and Gast (2007, pp. 110f.). They show that relations that would normally be encoded as adjuncts in German may be encoded as participants in English, for example the roles of instrument or location, as exemplified in (8).

- (8) a. *His green eyes* glinted with playful malice.
 b. *In seinen grünen Augen* glitzerte ein boshafes Lächeln.
 Lit: 'In his green eyes glinted a malicious smile.'

Crosslinguistic studies may also concern grammatical constructions, such as presentative or cleft constructions. Comparisons may take into account not only the form of the constructions, but also their frequency and their functional properties. Ebeling (2000) is a contrastive study of presentative constructions on the basis of the English–Norwegian Parallel Corpus (ENPC). The study starts from a survey of the construction in both languages based on original texts. Their translations are studied to reveal the paradigmatically related constructions that exist monolingually. The method and the material allow Ebeling to establish the range and the frequency of presentative constructions in both languages and the extent to which they correspond to each other. A similar study was carried out by Johansson (2002) on cleft constructions in English and Swedish. Both studies used lexically defined search terms to retrieve all the relevant constructions, followed by a great deal of post-editing of the search hits.

Other types of study cannot be undertaken by automated corpus methods. Examples are Johansson's (2007) study of subject change in translation and Hasselgård's (2004) study of thematic choice in English and Norwegian. Although both studies used part of the OMC, the retrieval of relevant examples had to be entirely manual, based on complete texts. Some of the findings were that Norwegian uses more formal subjects than English (also consistent with Ebeling's, 2000, findings) and in general prefers informationally lighter themes than English.

Cosme's (2008) study of clause linking in English, French, and Dutch likewise required careful manual analysis of a limited amount of material. She found that English and French are relatively similar in their preference for subordination versus coordination, while Dutch showed more of a tendency toward incremental discourse organization, that is, a greater preference for coordination. Close scrutiny of translations between English and French

also showed that the two languages differ as to the kinds of subordinate clauses that occur most frequently. Thus, although the three languages by and large share the resources for clause linking, attested language use shows different preferred patterns.

As pointed out by Kennedy (1992, p. 368), corpus linguistics can help identify “preferred ways of putting things.” Although this observation is made about monolingual corpus studies, it is no less true of corpus-based contrastive studies. Any comparison of units, classes, structures, and systems will bring out differences between languages as regards their lexicogrammatical potential; a corpus-based comparison may bring out crosslinguistic differences as regards the instantiation of that potential in discourse.

Applications of Crosslinguistic Studies of Grammar

Knowledge of crosslinguistic differences in grammar is invaluable in the teaching and learning of foreign languages. This was precisely the objective of early contrastive linguists such as Lado: “in the comparison between native and foreign language lies the key to ease or difficulty in foreign language learning” (1957/1971, p. 1). The principle of contrasting the native language with the language to be learnt is also visible in a number of pedagogical grammars for foreign-language learning, especially if they are intended for use in a specific language community. Such a contrastive focus may even be implicit, for example, in that particular attention may be paid to areas where the students’ first language (L1) is known to differ from the second language (L2) in such a way as to constitute learning problems.

Representing a different application of contrastive grammar, Salkoff (1999) formulates differences between French and English in the form of rules, with the aim not only of helping students of translation, but also of serving as a basis for machine translation. Contrastive grammar clearly has applications in translation practice as well as in translation studies, since the translator needs to know which structures and systems are equivalent in the source language and the target language, and where the two languages differ as to the division of linguistic labor or simply exhibit different grammatical preferences.

Crosslinguistic Influence and Multilingualism

SCOTT JARVIS

Introduction

Crosslinguistic influence is the often preferred term for a phenomenon more commonly known as *transfer*, which is the influence of one language on another, as witnessed in the language use (both comprehension and production) and other language-related behavior (e.g., categorization, gesturing, similarity and typicality judgments, reaction times) of both individuals and discourse communities. The former term is often preferred because it more naturally refers to a wider variety of crosslinguistic effects—including the overuse, underuse, and avoidance of language forms, functions, and structures in one language due to the influence of another language, as well as crosslinguistic effects at the level of conceptualization and mental processing—whereas the latter term is often interpreted as the literal transfer of a form, structure, or meaning from a person's knowledge of one language to their use of another (Kellerman & Sharwood Smith, 1986). Nevertheless, the two terms are often used interchangeably to cover the same range of meanings, and this convention will be followed here as well. *Interference* is another term that has frequently been used to refer to this phenomenon, but its use is naturally limited to the negative effects of crosslinguistic influence, which may represent only a minority portion of the ways in which one language affects another. For convenience, in this entry, crosslinguistic influence as a general phenomenon will be referred to interchangeably as *CLI*, *CLI effects*, and *transfer*.

Seminal work on CLI in the domains of second language acquisition, bilingualism, and multilingualism has resulted in a number of landmark findings (see Jarvis & Pavlenko, 2008, pp. 10–13). These include the positive effects of CLI, its effects on both the rate and stages of acquiring a second or additional language, the fact that CLI is driven more by similarities between languages than by differences, the fact that CLI effects tend to fluctuate as a person becomes more proficient in the target language and may even increase in some areas of language use, the finding that CLI effects occur in multiple directions (even from a second language to a first), the discovery that some language features are more likely to transfer than others, the finding that CLI extends beyond forms and structures to meanings and the social functions of language, and the observation that transfer is ultimately an individual-level phenomenon affected by factors such as motivation, aptitude, and personality.

The study of CLI has advanced considerably over the past several years in terms of both the contexts in which such effects have been found and the theoretical explanations that have been offered to account for them. A number of recent studies have focused on the discovery of CLI effects in areas of language knowledge and acquisition where transfer has previously been claimed not to occur. This includes transfer involving bound morphology such as locative suffixes (Jarvis & Odlin, 2000), the acquisition of tense and aspect (Ayoun & Salaberry, 2008), the order in which grammatical morphemes are acquired (Luk & Shirai, 2009), and the emergence of word order rules (Bohnacker & Rosén, 2008). Some

of the relatively new domains for the investigation of transfer include perception and naming patterns (Athanasopoulos, 2009), the construal and description of motion events (von Stutterheim & Nüse, 2003), lexical representations and lexical networks (Jarvis, 2009), working memory and the allocation of attentional resources (Trude & Tokowicz, in press), and the use of speech-accompanying gestures (Brown & Gullberg, 2008), to name just a few. Some of the important new theoretical perspectives on CLI include the multicompetence model (Cook, 2002), the thinking for speaking and conceptual transfer frameworks (Slobin, 1996; von Stutterheim & Nüse, 2003; Jarvis, 2007; Jarvis & Pavlenko, 2008), and models of inhibitory control, crosslinguistic interaction, and activation and resonance (Green, 1998; MacWhinney, 2005).

It is impossible to capture the full breadth of these advances in this entry, but the interested reader is referred to Jarvis and Pavlenko (2008) for a fuller synthesis of many of these developments. The present entry will offer a brief description of advances in the following areas: conceptual transfer, CLI and memory, and CLI and the brain. The term *multilingualism* in the title of this entry should be understood broadly as encompassing individuals regarded as bilinguals, multilinguals, and second language (L2) learners and users. Throughout the entry, all such individuals will be referred to interchangeably as either multilinguals or L2 users (cf. Cook, 2002) without any implied distinction between bilinguals and multilinguals or between L2 users and L3 (L4, etc.) users, even though such distinctions are often valuable. It is nevertheless relevant to point out that there are many types of multilingualism, and that a large number (if not most) of the studies on transfer in the language use of so-called bilinguals and L2 learners actually do involve participants who have learned a third or even a fourth language, at least in a classroom setting. The studies that have specifically examined the effects of the L1 versus a later-learned language on the use of another later-learned language have shown that the precise number of languages that a person knows plays less of a role in determining the nature and degree of CLI the person exhibits than do the following factors, among many others: (a) crosslinguistic similarity between the source and target languages (e.g., Ringbom, 2007); (b) proficiency in the source and target languages (e.g., Odlin & Jarvis, 2004); (c) context of learning and amount and type of exposure to the target language; (d) frequency, recency, and salience of the forms and structures that are candidates for transfer (e.g., Williams & Hammarberg, 1998); and (e) metalinguistic awareness (see Jarvis & Pavlenko, 2008, pp. 174–210 for a fuller treatment of these factors). Regarding this last factor, work discussed by Jessner (2006) suggests that the learning of each additional language leads to continually increasing levels of metalinguistic awareness, which in turn leads to faster rates of acquisition for each additional language, and also leads to a greater awareness of and reliance on crosslinguistic similarities between prior languages and the language currently being acquired. This may result especially in higher levels of positive transfer (cf. Odlin, 1989, p. 152). Again, however, CLI patterns do not vary in a binary manner depending on whether a person knows just two versus three or more languages; rather, all of these factors and others work together along a multidimensional continuum in effecting the types and extent of CLI that will emerge in any language-use situation.

Conceptual Transfer

Conceptual transfer refers to cases where a multilingual's language behavior or language-related behavior (e.g., categorization, typicality judgments, gesturing) exhibits CLI effects that are interpreted as having taken place in the person's conceptual system prior to the conversion of his or her preverbal message into language (Jarvis, 2007; Jarvis & Pavlenko, 2008). Studies on conceptual transfer can be viewed as attempts to investigate CLI within

the paradigm of cognitive linguistics, which allows researchers to hypothesize that certain instances of CLI in a multilingual's use of one language originate from the experiential categories and patterns of event construal that the person has acquired as a speaker of another language. This line of inquiry shares much in common with the *thinking for speaking* framework (Slobin, 1996), as well as with Levelt's (1989) speech production model and the work by von Stutterheim and colleagues on information structure and conceptualization (e.g., von Stutterheim & Nüse, 2003). However, whereas these other frameworks were originally developed to account for other phenomena, such as monolingual speech production and differences across languages in the organization and expression of information, the conceptual transfer framework has been formulated to focus exclusively on CLI. Within that focus, conceptual transfer actually has a broader scope than these other frameworks in the sense that conceptual transfer deals not just with conceptualization (i.e., the process of forming temporary mental representations of complex situations and events), but also mental concepts (i.e., the structure and content of mental categories). Both phenomena fall within the purview of conceptual transfer, and Jarvis (2007) proposes the terms *conceptualization transfer* and *concept transfer*, respectively, for purposes of distinguishing the two when necessary.

Although it is difficult at present to establish with certainty whether particular CLI effects originate within a person's conceptual system, the empirical evidence for conceptual transfer has accumulated quite substantially over the past few years, and much of it is quite compelling. It includes the finding that there exist crosslinguistic differences and corresponding CLI effects in multilinguals' patterns of naming, categorizing, and judging the similarity and typicality of various colors, shapes, substances, and objects (Cook, Bassetti, Kasai, Sasaki, & Takahashi, 2006; Athanasopoulos, 2009). It also includes the finding that there exist CLI-related differences in how multilinguals from different language backgrounds interpret the meanings of tense and aspect markers in both the L1 and L2, how well they can distinguish between completed and non-completed actions (Trude & Tokowicz, in press), and how well they can remember certain types of information (see Jarvis & Pavlenko, 2008 for a review of these findings). In terms of conceptualization, the accumulating evidence also shows that multilinguals with different language backgrounds display differential effects in how they segment strings of continual action into discrete events (von Stutterheim & Nüse, 2003), how they construe motion events in terms of manner and path of movement (Hohenstein, Eisenberg, & Naigles, 2006), and which components of those events they select for verbalization (von Stutterheim & Nüse, 2003). Crucially, these findings are bolstered by additional evidence from multilinguals' speech-accompanying gestures (Brown & Gullberg, 2008) as well as eye fixations and ability to recall certain characteristics of events they have witnessed (von Stutterheim, Bastin, Carroll, Flecken, & Schmiedtová, under review). These additional forms of evidence seem to confirm that these CLI effects do indeed occur at the conceptual level, perhaps often in combination with simultaneous CLI effects at the linguistic level.

Most of the research on conceptualization transfer has focused on the construal of motion events in narrative tasks. There is a great deal that we do not yet know about what types of CLI might occur in multilinguals' conceptualization of scenes, situations, arguments, and forms of reasoning and problem solving in tasks other than narratives. There is also still a great deal to be discovered about the relationship between conceptualization transfer and concept transfer, particularly with respect to the templates (or schemas) that people rely on when forming temporary representations of events and situations they have encountered or imagined (Langacker, 2008). These schemas are presumably stored in long-term memory and therefore constitute concepts, so crosslinguistic differences in event construal may very well reflect not just conceptualization (i.e., processing) differences, but also concept (i.e., knowledge) differences. It is important to discover whether speakers of

different languages actually have differently structured event schemas, or whether they simply differ in terms of which schemas they tend to access in particular contexts. Finally, it is relevant to ask whether certain concepts and conceptual patterns might constitute universals and are therefore not relevant to crosslinguistic influence.

CLI and Memory

Memory, and particularly working memory, is either directly or indirectly involved in all cases of CLI, but the relationship between transfer and working memory is just now beginning to receive explicit empirical attention. Two fundamental questions in this area concern the relationship between transfer and working memory capacity (WMC): Does crosslinguistic similarity affect WMC, and does WMC affect transfer? The first question can be further delineated as follows: Does the degree of similarity between the L1 and L2 affect (a) *how much* of the L2 input an L2 user is able to retain in working memory, (b) *how accurately* the input is retained, and (c) *how long* it is retained? Similar but more complicated questions concern cases involving more than two languages, such as when the target language is an L3 and the L1 and L2 differ with respect to how similar they are to the L3. The answers to these questions will of course also be complicated by the multilingual's types and levels of proficiency in each language. These questions have not yet been fully addressed, but two studies that suggest that crosslinguistic similarity does indeed affect whether, how much, and how accurately L2 users are able to process and retain L2 input are Fender (2003) and Odlin (2009). Fender found that due to language differences and differences in educational training, Arabic- and Japanese-speaking L2 users of English tend to have different underdeveloped reading subskills that interfere with WMC and therefore also with reading speed and comprehension. Odlin examined whether Finnish-speaking and Swedish-speaking L2 users of English differ in terms of how well they are able to make use of intermittent written titles appearing in a silent film they were asked to describe. The results showed that the Swedish speakers retained more information from those titles than the Finnish speakers did, a finding Odlin attributed to the greater degree of similarity between Swedish and English than between Finnish and English. He also related these findings to Ringbom's (2007) work on the importance of crosslinguistic similarity for L2 comprehension, learning, and production, all of which can be understood in relation to memory processes and resources.

Regarding the effects of WMC on transfer, some of the relevant subquestions are whether L2 users with higher WMCs might show different types and amounts of CLI. It is of course also relevant to ask to what degree any such effects might be moderated by other factors, such as language proficiency, language aptitude, and so forth. A study by Trude and Tokowicz (in press) addresses these questions to a certain degree in an investigation of the effects of WMC on L2 users' ability to inhibit their L1 while using the L2 (cf. Green, 1998). Viewing working memory as the sum of short-term memory capacity and controlled attention, the researchers investigate specifically whether L2 users with lower WMCs make more L1-induced pronunciation errors due to their reduced ability to inhibit irrelevant (i.e., non-L2) information. The researchers recruited two groups of adult English speakers: one with no prior instruction in any Romance language, and one with at least four semesters of Spanish as a foreign language. The WMCs of both groups were tested and they were given a tutorial in Portuguese pronunciation. Later, they were tested for their ability to recall Portuguese sound-letter correspondences, and the researchers analyzed the types and numbers of errors they made. The results showed that higher WMC was associated with higher accuracy on the recall test, and, interestingly also, that the L2 users with higher WMCs exhibited a higher proportion of Spanish-like errors. The researchers interpreted

both of these findings as suggesting that the participants with higher WMCs were more successful at inhibiting L1 interference, but that they tended not to direct attentional resources toward the inhibition of their less dominant (and presumably less activated) L2 Spanish. An alternative explanation, however, may be that the perceived similarities between Spanish and Portuguese make Spanish more difficult to inhibit (e.g., Ringbom, 2007).

These studies raise a number of additional questions that can profitably be explored in future research. One of the most crucial questions is that, if crosslinguistic similarity does indeed affect WMC, then how is crosslinguistic similarity to be defined? That is, what are the specific similarities that L2 users are able to benefit from in relation to WMC, and are there certain types of similarities that are more critical than others? Also, is there a certain threshold level of crosslinguistic similarity that needs to be crossed before the similarities have a positive effect on WMC? These questions of course extend beyond transfer and have implications for learning in general.

CLI and the Brain

Perhaps the final frontier in the investigation of transfer is the pursuit of when, where, and how transfer occurs in relation to brain physiology. Although the answers to these questions might never become perfectly clear, research has nevertheless begun to address them with neuroimaging technology focusing on (a) the composition of brain tissue through the use of structural magnetic resonance imaging (MRI) and (b) brain functioning through the use of functional magnetic resonance imaging (fMRI) and the measurement of event-related brain potentials (ERPs). Like the research on working memory, the research involving brain imaging so far has addressed transfer primarily from the perspective of effects associated with crosslinguistic similarity.

Concerning CLI effects on the composition of brain tissue, a paper by Green, Crinion, and Price (2007) reviews evidence showing that, with increasing vocabulary knowledge, English speakers develop increasing grey matter density in a specific area of the brain called the posterior supramarginal gyrus. Further research reviewed by the authors shows that Italian-speaking L2 users of English exhibit an even greater density of grey matter in precisely the same area, due presumably to their greater vocabulary knowledge across both languages. This seems to indicate that vocabulary knowledge is stored in the same location regardless of the language it is associated with. However, in the authors' own empirical comparisons of multilinguals who know Chinese versus those who do not, they found what appears to be a clear language-specific effect. The multilinguals who knew Chinese either as an L1 or L2 showed "highly significant enhancement of grey matter density" (p. 195) in areas of both the right and left hemispheres where neither monolingual English speakers nor Italian-English multilinguals show such density. The authors interpreted this result as reflecting the fact that Chinese lexical knowledge requires the encoding of tonal distinctions, which appears to require additional types of neural resources than those needed for the storage of English or both Italian and English vocabulary.

Regarding CLI effects on brain functioning, Kotz (2009) summarizes the relevant ERP and fMRI research. ERPs measure electrical brain activity along a time dimension and in relation to factors such as amplitude and polarity. Two very important ERP components are known as N400 and P600, the former of which refers to a negative voltage deflection occurring approximately 400 ms after a person first encounters a stimulus, and the latter of which refers to a positive voltage deflection occurring approximately 600 ms after the initial perception of the stimulus. According to Kotz, N400 is associated *inter alia* with morphosyntactic, semantic, and thematic role assignment, whereas P600 is associated with

syntactic reanalysis and repair. The research on L1 syntactic processing has found relatively stable N400 and P600 effects in native speakers when processing certain ungrammatical, ambiguous, or complex syntactic structures. Research on L2 syntactic processing has likewise found that multilinguals and L2 users sometimes do and sometimes do not show the same effects. One of the factors that determines whether N400 and P600 effects will occur appears to be crosslinguistic similarity. Studies by Tokowicz and MacWhinney (2005) and several others reviewed by Kotz (2009) show that positive transfer of N400 and P600 effects occurs in L2 users' performance on L2 sentence processing tasks when the L2 structures in question (e.g., tense marking, gender and number agreement) are congruent with L1 structures, and that N400, P600, or both effects fail to emerge in many cases where L1 and L2 structures are incongruent.

The results of the relevant fMRI studies are somewhat different in that they focus on areas of brain activity rather than on the timing of particular electrical events, although there is a relationship between the two (see Kotz, 2009). The relevant studies have confirmed that the activation of specific areas of the brain in multilinguals depends largely on the particular combinations of languages they know, and also especially on how similar those languages are to one another. A study by Jeong, Sugiura, Sassa, Haji, et al. (2007), for example, found that native Korean multilinguals who know Japanese and English as additional languages (with equivalent proficiency in both) showed activation of certain areas of the brain only during sentence comprehension tasks performed in English (i.e., not in equivalent tasks performed in either Korean or Japanese). A second study by Jeong, Sugiura, Sassa, Yokoyama, et al. (2007) provided additional evidence of the effects of specific language combinations. The participants included a group of native Korean multilinguals with Japanese and English as additional languages, and a second group of native Chinese multilinguals with the same additional languages. The results of sentence comprehension tasks performed in all three languages by each multilingual showed the activation of various parts of the brain in English versus the L1 was higher for Korean speakers than for Chinese speakers, whereas the activation of various parts of the brain in Japanese versus the L1 was higher for Chinese speakers than for Korean speakers. Given that Korean is more similar to Japanese than to English, and given that Chinese is structurally more similar to English than to Japanese, the results of this study suggest that crosslinguistic similarities play an important role in the areas and levels of brain activation in multilinguals.

These studies have of course just barely begun to scratch the surface of the some of the most fundamental questions not only for CLI research but also for the fields of multilingualism and second language research more generally. Some of the most crucial questions are the following: How are a multilingual's two or more languages stored and processed in the brain in relation to each other? To what degree and in which areas is a person's knowledge and processing of two or more languages separated versus integrated? What are the differences between a monolingual's and a multilingual's knowledge and processing of the same L1?

Summary

While traditional investigations of both positive and negative transfer in various subsystems of language competence continue, the study of CLI as an object of both empirical and theoretical interest has expanded into the realms of cognition and brain physiology. In both the traditional and new areas of investigation, researchers no longer appear to claim that CLI is completely nonexistent in any particular domain of language knowledge or use, but rather appear to be more interested in examining and discovering more precisely

what its role may be in combination with a host of other factors. A major challenge for the future is the continual discovery of ways in which its effects are manifested, particularly in the still relatively unexplored domains of language knowledge and use, and also in cases where such effects may remain hidden without the development and proper use of new, highly sensitive tools and forms of analysis.

Crosslinguistic Influence in Second Language Acquisition

TERENCE ODLIN

Terminology

The phrase *crosslinguistic influence* (CLI) is roughly synonymous with other terms, most notably *language transfer* and *interference*, in that all refer to the influence of one language upon another, most typically in cases of second language acquisition (SLA). These terms continue to be used widely, but in each case the expression is really a cover term for a wide range of phenomena. For that reason, secondary terms are often used, such as *positive transfer* to refer to the facilitating effects of one language in acquiring another (e.g., of Spanish vocabulary in acquiring French) and *negative transfer* to refer to divergences due to some differences between the target language and a source language (most typically the native language of the learner). Still another cover term often used is *substrate influence*, but this is found mainly in historical or sociolinguistic studies of language contact, such as work on the influence of certain African languages on the development of creoles in Surinam (Migge, 2003).

While the terms in the first sentence are roughly synonymous, they are not equivalent. *Interference*, for instance, normally implies some kind of negative transfer such as production errors, as when a native speaker of Finnish says, *They sit to the grass* instead of *They sit on the grass*, where the Finn's use of *to* indicates influence from Finnish (Jarvis & Odlin, 2000). Although language-contact studies often emphasize interference in discussions of substrate influence, the facilitating effects of positive transfer are no less important for SLA research.

It is worth noting that the Latin etymology of *transfer* suggests carrying (the *-fer*) across (*trans-*), and a German term for transfer, *hinübertragen*, likewise suggests the motion metaphor, as does the *cross-* in *crosslinguistic influence*. The term *transfer* has occasionally been criticized for its suggestion that something moves somewhere even though the linguistic phenomena are often not physical but rather psychological and social. The metaphor is not a problem, however, as long as researchers keep in mind the essential function of transfer (or any synonym) as a cover term. In this respect it is not very different from the term *metaphor*, which has a similar etymology, or the term *translate*, which is from the same source as *transfer*, even while *metaphor* and *translate* obviously denote rather different linguistic phenomena (Dechert, 2006; Odlin, 2008).

Apart from facilitating and interfering influences, other phenomena that CLI or transfer can denote include not only the influence of a first language on a second (e.g., L1 Finnish on L2 English) but also the influence of a second language on the first (L2 English on L1 Finnish). Any case of second language acquisition implies at least the possibility of both kinds of CLI, and such mutual influences are sometimes studied jointly and are often termed *bidirectional transfer* (e.g., Pavlenko & Jarvis, 2002). Even so, much research focuses on either L1→L2 influence (e.g., Han, 2010) or L2→L1 influence (e.g., Porte, 2003). While second languages are often the research concern, crosslinguistic influence is also manifest in many cases of the acquisition of a third language (De Angelis, 2007). In such cases the

influences could be L1→L2 or L2→L3, with combined effects of L1 and L2 also being possible as well as reverse influences (e.g., L3→L1). Contexts involving a third language (L3), a fourth language (L4), and so on are often termed *multilingual transfer*.

Crosslinguistic influence affects both production and comprehension. Numerous studies (including many reviewed by Kormos, 2006) have identified influences from the speech-production system of the L1 in vocabulary, pronunciation, and grammar, and there are likewise many studies of CLI in written language (e.g., Jarvis, 1998). The comprehension of spoken and written language is also subject to a variety of influences from the L1 processing systems (e.g., Grabe, 2002; Fender, 2003). One analysis (Ringbom, 2007) maintains that crosslinguistic similarity (as with English and Swedish) proves especially useful in comprehension and thereby indirectly aids production by freeing processing resources for the demands of speaking or writing in a new language.

Errors such as use of the preposition *to* cited above are the most salient manifestation of negative transfer, but the L1 can be involved in other ways as well. Hypercorrections, for example, may arise where the L1 has one phoneme, for instance voiceless velar /k/ in Finnish, while the L2 has more than one, as where English has two velar stop phonemes, /k/ and /g/. Although a spelling error such as *crass* for *grass* could be viewed as a substitution of Finnish /k/ for English /g/, this explanation will not work for the spelling of English *comes* as *gomes*, since Finnish has no /g/; accordingly, the latter error, but not the former, is a hypercorrection. The absence of something in the L1 can sometimes lead to simplification, in the sense that a similar absence is evident in a learner's speech or writing. Finnish does not have articles, and native speakers of that language are more prone to using noun phrases with no article than are native speakers of Swedish, a language that has articles (Jarvis, 2002; Odlin, 2012). In other cases, the presence of something in the native language can induce avoidance, as in the apparent aversion to using certain English words by speakers of Nootka and Thai because the English forms sound too much like taboo words in their L1s (Haas, 1951). In these examples of avoidance, simplification, and hypercorrection, something is absent either in the learner's L1 (e.g., a /g/ in Finnish) or in the learner's attempts in L2 (e.g., certain English words avoided). Because of the *absence* of something, the influence of the L1 on the L2 is not as obvious as the prepositional error with *to*, but in such instances the native language nevertheless proves to be a cause for what is found (or not found) in the learner's L2.

The Verification of CLI

Crosslinguistic influence has been a controversial topic in SLA research, and linguists seeking to demonstrate such influence have employed several methods of verification. One that has often proved persuasive requires having more than one group of native speakers using the target language, the logic being that different L1 groups will at least sometimes show differences in how they use or understand the target language. The examples from Finland given above can illustrate the advantages of such a method. When speakers of Finnish are compared with native speakers of Swedish, there are often significant intergroup differences. Thus, Finnish speakers (but not Swedish speakers) sometimes erroneously supply the preposition *to* when constructing a sentence such as *They sit ___ the grass*. Similarly, Finnish speakers (but not Swedish speakers) sometimes produce misspellings such as *gomes*. Differences in these and other cases can be correlated with characteristics of the native languages.

Similar comparisons have been used with other groups as well (e.g., comparisons of speakers of Tamil and Gujarati by Mesthrie & Dunne, 1990), but the situation in Finland has offered special advantages because of the relatively homogeneous social—but not

linguistic—background of the groups. While most citizens (some 93%) are native speakers of Finnish, a sizable minority speak Swedish as the L1 (ca. 6%). According to Ringbom (2007), the socioeconomic differences between these language communities are not great, and the similarities include the schooling that children in the two groups receive. Much greater are the typological differences between the languages, with Swedish being, like English, a Germanic language, whereas Finnish belongs to a non-Indo-European family (in the Finno-Ugric branch of Uralic). The similarities of Swedish to English give a considerable advantage in learning English vocabulary, pronunciation, and grammar including articles and prepositions. Even while some Finnish speakers do cope well with these challenges of English, speakers of Swedish tend to do better on national examinations (Ringbom, 2007). Since the social backgrounds of students are similar, the differences in success with English seem due much more to linguistic than to social factors.

The above examples of written English of students in Finland come from a database developed by Jarvis (1998), who also collected similar writing samples in Finnish, Swedish, and English from native speakers of these languages. Thus the corpus consists of five subcorpora, three for the native-language samples plus one for English as written by Finnish speakers and one for English by Swedish speakers. All individuals had the same discourse task (describing the events in scenes of a film). The purpose of having five corpora with a uniform discourse profile was to identify structures in the native languages that would be the source for the patterns of apparent transfer, whether positive or negative. In errors like *sit to the grass*, the corpus of native Finnish shows instances such as *istuvat nurmikolle* ('sit grass-to'), where the suffix *-lle* is a case inflection indicating movement toward a goal, the technical term for this particular inflection being *allative case*. Without having the Finnish corpus, researchers might accurately surmise that the allative inflection is the source of such preposition errors, but with actual examples of native-speaker usage, the surmise has stronger support. It is also possible to detail the positive transfer enjoyed by Swedish speakers in their use of articles by contrasting the presence of articles in L1 Swedish and their absence in L1 Finnish, resulting in a very great difference in the use of articles in English by the two L1 groups (Jarvis, 2002).

Although positive transfer most typically involves successes in exploiting a real similarity between the native and target languages, errors sometimes imply at least a little positive transfer (Ringbom, 1987). In the following example, *some* is a slightly respelled Swedish relative pronoun (*som*)—which should be *who* or *that*—in the sentence *That were girl some stole [bread]* (Odlin & Jarvis, 2004, emphasis added). Once again, the writing in the L1 makes clear the source of the error: *Efter en stund kom damen som hade stulit bröde* ('After a moment came the woman who had stolen the bread'). Although native speakers of Finnish produced other errors with relative clauses, none used *some* in this aberrant way. However, what is just as significant as the error with *some* is the use of a relative clause in English; in other words, the similarity of relative clauses in Swedish and English results in the helpful and interfering influences from Swedish simultaneously. A well-known fact about CLI is the danger of so-called false friends, as in the error with *some*. However, Ringbom (2007) has viewed the facilitative influences of Swedish as more significant than the false friends, and the partly positive transfer of *some stole* supports that view.

If the problem of using *some* as a relative pronoun were widespread among other L1 groups, it would be harder to argue for a specifically Swedish influence. However, the error seems to be specific to the Scandinavian language-contact setting. Similarly, the development of a special perfect construction in the English of Ireland and Scotland reflects a very specific regional and linguistic setting, where the verb phrase *is after going* is a present perfect construction in sentences such as *The stone is after going through, he says* (= *The stone has gone through*). Equivalent constructions exist in Irish and Scottish Gaelic, and so the likelihood of CLI is high (Odlin, 2008). The cases of *some* and *after* show that

structures not found in many language-contact situations can sometimes prove to be plausible examples of transfer, even though the method of explicitly comparing two or more L1 groups (as in the case of *some*) offers potentially more detailed analyses.

Constraints and Individual Variation

The above methods provide a way to verify the occurrence of CLI and likewise to falsify some claims about constraints on such influence. For example, the evidence for the positive transfer of articles from Swedish to English falsifies a hypothesized constraint in universal-grammar research about the nontransferability of “functional projections,” an abstract structure that includes articles (Vainikka & Young-Scholten, 1998). Similarly, there have been claims of constraints on the influence of L1 word order, L1 inflectional morphology, and L1 idioms, yet, in each case, actual instances of transfer are evident in the literature on SLA and language contact. Although predicting when transfer will occur has long been viewed as a problem, it is no less risky to predict when transfer will not occur (Odlin, 2006).

Specific characteristics of linguistic systems no doubt influence what learners consider transferable, but systemic factors are not immune to individual judgment. Kellerman (1977) stressed the skepticism of many learners that figurative expressions such as *dyed-in-the-wool* (which has a close counterpart in Dutch) were bona fide idioms. For some students, such expressions seemed too close to Dutch to be real. However, Kellerman’s figures (pp. 118–19) show considerable individual differences, where not all Dutch students took such a skeptical view. The reporting in Kellerman’s study makes it easier to see the importance of individual differences than is the case in some research where statistical treatments focus even more on group tendencies. However, no thorough understanding of the transferability issue seems possible without taking learner differences into account.

Habits and CLI

The controversies over CLI are salient in accounts of the history of SLA (e.g., Larsen-Freeman & Long, 1991) that link the idea of transfer to behaviorist theories of language learning. Selinker (2006) recalls that a key proponent, Robert Lado, was a behaviorist; even so, Selinker also states that Lado’s mentor Charles Fries was not (and Selinker himself had studied with both). Certain other structuralists such as Benjamin Lee Whorf (1956) resemble Fries in rejecting behaviorism yet accepting the reality of CLI. Such evidence thus argues against equating CLI with behaviorism even in the structuralist era. Part of the historiographical problem is that many structural linguists including Fries, Lado, and Whorf used the term “habit” in connection with the psychology of learning, yet the word often went undefined and did not invariably imply behaviorist concepts.

Whatever the ambiguities of the term “habit,” more recent work in SLA distinguishes a number of phenomena in CLI that the term could denote, including these: activation, automaticity, and entrenchment. Activation can take place in varied circumstances, including when a word in the second language evokes one or more meanings in the native language. Elston-Güttler and Williams (2008), for instance, found that among Germans who use English as L2, the English noun *bag* apparently evokes the joint L1 meanings of pouch and container (the German word *Tasche* can denote either a pocket or a bag). Automaticity serves the needs for speed and economy in language processing, but patterns that are automatic in the native language can contribute to a foreign accent. Hammarberg (2001) observed that a learner of L3 Swedish initially relied more on L2 German similarities with Swedish but that she had more difficulty in suppressing her L1 English phonetic patterns as she grew more fluent in the L3. Hammarberg attributes this problem to the

automaticity of motor patterns linked to L1 English phonetics. Entrenchment can result from an L1 influence that persists and makes it difficult or perhaps even impossible to fully acquire structures such as English articles, which are formally simple yet semantically and pragmatically complex (Han, 2010; Odlin, 2012). The notions of activation, automaticity, and entrenchment are no doubt interrelated, but much more research will be needed to understand the precise nature of the relationships.

Phenomena such as entrenchment were indeed considered in the structuralist era, as seen in a discussion by Whorf of the “binding power” of L1 English on L2 French (1956). Both then and now, the extent of such power remains unclear, partly because of the difficulty of understanding the relation between language and thought (which is sometimes referred to as the “Whorfian” problem). There is research (e.g., Lucy, 1992) supporting some of Whorf’s beliefs about the existence of language-specific effects on cognition. If, as Lucy’s work indicates, there are subtle cognitive influences that vary with the native language that one happens to speak, such differing influences may play a role in certain types of CLI. Accordingly, phenomena such as entrenchment may have a deep-seated cognitive as well as linguistic basis. Although Whorf’s name is often associated with the label *linguistic determinism*, he was more optimistic than some recent psycholinguists, believing as he did that linguistics could help learners overcome the “binding power” of the native language (Odlin, 2008). How true Whorf’s view may or may not be remains an important research question.

Cultural Approaches to Translation

DAVID KATAN

There are numerous cultural approaches to translation, given the numerous definitions of both “culture” and “translation.” We might say that both culture and translation revolve around difference. We notice culture as difference, and we require translation when difference significantly affects communication. The approaches may then be divided according to how difference between self and other should be managed in translation. In the first case, “translating from cultures,” differences should be *explained*. In the second, “translating for cultures,” differences should either be *reduced* (domestication) or *highlighted* (foreignization). The final approach, “translating between cultures,” gauges the likely tolerance for difference and attempts to mediate or *reconcile* differences, creating an interspace.

In all cases, it is understood that texts are seen to relate to larger contexts, or frames of interpretation; and that translation involves a form of intervention which goes beyond language transfer.

Translation *From* Cultures

Malinowski was a pioneer in terms of cultural approaches to translation, though he was neither a linguist nor a translator. As an anthropologist he realized that explaining “the native view” of the magic in Trioband stories to an English audience required more than a literal translation, and hence he was “continually striven to link up grammar with the context of situation and with the context of culture” (1935, p. 73). The context of culture is a wide encompassing frame relating to assumptions regarding appropriate behavior, practices, and values as cued by language (Halliday & Hasan, 1989, p. 47; see also Katan, 2004).

Take, for example, the following passage from novelist Jane Austen. At a certain point, Emma finds “her hand seized—her attention demanded, and Mr. Elton actually making violent love to her.” The context of situation, pre-Victorian, will inform us that the language cued “courtship”; but to actually understand Emma’s attribution of “violent” we would need to know the context of culture, such as how to court 19th-century style, and at what stage the language and behavior would be considered “violent.” More generally, as Goffman (1974/1986, p. 25) put it, readers need to know “What is it that’s going on here?” and to have ways of giving meaning to that practice or, as he says, of accessing “schemata of interpretation” (p. 8).

If the interpretative frame, or schema, is an internal cognitive representation, then the “thick description” is what the anthropologist will use to help the outside reader access that interpretative frame. Appiah (2000, p. 427) suggests the same approach for translation, defining “thick translation” as “translation that seeks with its annotations and its accompanying glosses to locate the text in a rich cultural and linguistic context.” The translator here is a visible frame maker *explaining* cultural differences to the target reader, often through extratextual devices. The famous Victorian translation of *The Thousand and One Nights*, for example, became well known for its explanatory notes on the manners and customs of Muslim men. Yet there are few examples of this type of intervention (Snell-Hornby, 2006, pp. 98–9). This is because most translators and scholars still feel that the

use of any extratextual notes is not only a sign of translator indecision or inadequacy, but is also off-putting for the reader. So, traditionally, this has been the approach to scholarly works only, such as the translations of the Bible. For the time being, thick translation remains a seldom-used cultural approach.

Translating *For* Cultures

The first translator to offer detailed considerations about the context and to offer a more acceptable cultural approach to translation was Bible scholar and translator Eugene Nida. Though he professed an anthropological approach to *explaining* the source-text culture, he actually had much more interest in allowing readers to read and respond to the Bible in translation in the way the gospel writers had originally intended. However, as he notes, "Reader response can never be identical to the original due to different historical, cultural and environmental contexts" (1964, p. 159).

Reducing Difference

Nida's approach, then, was to translate through dynamic (or functional) equivalence: "Translating consists in reproducing in the receptor language the closest natural equivalent of the source language message, first in terms of meaning and secondly in terms of style" (Nida & Taber, 1969, p. 12). The target words would then trigger the same associations and emotional effect as those of the original text. Hence Nida's provocative suggestion to substitute the meekness of "the lamb of God" for Inuit readers with the image of a meek "seal of God."

According to this approach, a translation is unsuccessful when the reader begins to experience a "culture bump" (Leppihalme, 1997, p. 4), which is "where a reader of a TT [target translation] has a problem in understanding a source-cultural allusion." Today, audiovisual (AV) translation scholars are particularly aware of the "lingua-cultural drop in translational voltage" (Antonini & Chiaro, 2005, p. 39). The area of intervention revolves around omitting, glossing, retaining, or substituting references such as "institutions" and "pastimes" through to "celebrities and personalities." The approach is linguistic, hence nonverbal aspects of signifying cultural practices, such as the use of color, sound, kinesics, and proxemics, meaningful to one audience but not to another, are rarely discussed.

Nida himself was heavily influenced by Chomsky, and used semantic structures to tease out culture-bound meanings. A development of this linguistic approach has been successfully used with comparable corpora. Tognini Bonelli and Manca (2004), for example, show how "Children and dogs welcome" (a standard collocate in accommodation brochures) must be translated differently if dynamic equivalence is to be maintained. The cultural approach here is to analyze target-language collocation frequency lists. In this particular case, Italian dogs are never "welcome," but "accepted." Even more interesting is the fact that children in Italian accommodation brochures are not even mentioned. Children, by default, are always welcome. Hence, assumptions about "children" are clearly dependent on the context of culture.

So far, culture and the context of culture have been perceived as fixed and rather structured entities, framing an original or translated text. During the 1980s, a new loosely defined school of thought began to appear in translation studies, subsequently labelled as the "cultural turn" (Snell-Hornby, 2006, p. 56). The emphasis now was on the text as an integral part of a larger network or system of cultural signs, and no longer bound by the search for the formal or dynamically equivalent *mot juste*.

Deconstructionism and "the death of the author" were extremely influential. They paved the way for the functionalist approach, which was to focus translators' attention away

from text-based equivalence toward the *skopos*: “the function that the target text is intended to fulfil” (Vermeer in Nord, 2005, p. 27). Reducing difference was no longer primarily linked to fidelity with the original text, but now to target-text coherence within a reader’s particular world. However, to do so, the translator would still have to construct a particular (and static) context of culture.

Also important was the idea of translation as rewriting (Lefevere, 1992) and of translation as anything that the culture accepts as such (Toury, 1995, p. 26). This rethinking of the relationship between the text and its particular contexts meant that there could be no definitive translation, and that now the difference between “a translation” and “an adaptation” was blurring. As a result, translation studies had finally broken “the two thousand year old chain of theory revolving around the faithful vs. free axis” (Gentzler, 2001, p. 71).

Thus, the cultural approach favored by the functionalists considers not only culture-bound terms and collocations, but also culturally appropriate genre styles and norms (Reiss & Vermeer, 1984; Toury, 1995). This has led to a growth in studies on the subject known variously as “comparative stylistics,” “intercultural rhetoric,” or “comparative pragmatics” (e.g., Wierzbicka, 2003; Bühlig, House, & Ten Thije, 2009). These studies tend to focus on models of appropriate writing style across languages and, in some cases, the culture-bound motivations fostering such styles (e.g., Katan, 2004).

The “cultural filter” became a popular analogy. Like a pair of sunglasses, the filter distorts the way in which reality is perceived, and hence also accounts for the differences in interpreting meaning across linguacultures. For some, the filter should be used actively by translators for non-fictional texts only (e.g., Bühlig et al., 2009). For others (e.g., Katan, 2004), cultural and other perception filters are an integral part of interpretation of any text.

An approach designed not just to reduce but to eliminate any trace of source-text culture came originally from the software industry, which needed to “localize” (American-based) products around the globe. The task required making modifications to products and services so that they could sell just as well in local markets worldwide. The cultural approach here involves, for instance, not only adapting the examples and illustrations in the instruction manual for the various languages, but also adapting the language of the software instructions and responses in the computer or phone. Many other features need to be adapted, such as the type of guarantee and often the plug itself. Also, colors and graphics will often be modified to meet local cultural norms. Ideally, to improve efficiency, products and documentation will be market-ready, already “internationalized” (i.e., free of an American context of culture) and hence ready to be localized into all languages through more automated translation.

The translation of comic literature has also been considered a form of localization (Zanettin, 2008), where not only is the dialogue adapted according to the sensitivities of the receiving culture, but there is often new editing, additional cover art, lettering, and retouching. Donald Duck in Italian, for example, becomes an Italian icon known mainly by his new surname Papparino (Duckling), and is more respectful to his elders; while in Arabic he never kisses. However, comic writing has yet to be internationalized.

Though comic and other writing often takes on a new local voice, many translation scholars have noticed that much of the domestication is actually producing a more standardized approach to translation worldwide; and where internationalization does take place it tends to follow an Anglo-American style. The result is a rationalized monocultural “McDonaldization” of translation (Katan, 2004). So, for reasons of efficiency—or hegemony according to postmodernist thinking (Robinson, 1997)—the translation industry is being streamlined into a universal way of thinking and practicing, as envisaged through one local (American) set of appropriate translation strategies and writing styles. In its favor, we have a startling number of instant multilanguage versions of manuals, software, games, (Hollywood) films, and even breaking news. Also the concept of a global norm and lingua

franca (English) regarding academic and scientific production fosters the global dissemination of ideas and helps those from minority languages earn international recognition. Also, oppressed groups such as the Dalits (traditionally regarded as an Untouchable caste in India) have found themselves a new voice and an appreciative audience through translation into English, bypassing local caste opposition and able to make an international case for justice at home (Kothari, 2007).

On the other hand, these voices find themselves standardized in English: “the literature by a woman in Pakistan begins to resemble, in the feel of its prose, something by a man in Taiwan” (Spivak, 2000, p. 400). And translation out of English, constrained through lack of time and space (and in the end money) means that readers and viewers learn to live with “translationese” or “dubbese,” as the Anglo-American style is squeezed, unlocalized, into other language spaces on computers, phones, and film.

Hence, in this more global view of culture, difference is indiscriminately reduced. The “other,” through economies of scale, is classified rationally, simplified, and stereotyped, reducing any in-depth understanding. In the academic and scientific world of discourse “epistemicide” (Bennett, 2007) may take place, whereby the straitjacketing of academic ideas to an Anglo discursive style might actually result in the *loss* of ideas.

What is being seen is gatekeeping on a global scale, where information and translation is controlled in such a way that minority voices (writing styles, literatures) have difficulty in being heard *as different*. Lefevere (1992) introduced the term “patronage” to describe the economic and political power issues involved in gatekeeping the translation of literature. As a result, American film, TV, and fiction are routinely translated, while all other nationalities’ output is not—due principally to issues of patronage rather than to inherent merit.

Highlighting Difference

As a response to the above, postcolonial thinkers are attempting to delimit the spread of what they see as an Anglo-American monoculture globalizing the planet. Culture here is ideological and a sign of power. “Difference” is now seen in terms of inequality, superiority, and inferiority. This approach pits itself *against* the dominating colonial master voice in translation (Venuti, 1998), to safeguard the voices of the subaltern languages and literatures. This is no easy task when the very essence of translation itself entails the removal of one language in favor of another, and the voices themselves (in translation) will be reinterpreted through the limiting cultural filters of the target reader discussed earlier.

The cultural approach, here, attempts to expose and empower the translator, seen no longer as invisible and working passively within the system, but as “committed” or even as “an activist,” aiming to consciously intervene against those gatekeeping activities that tend to exclude minority voices. The more activist translators may intervene by subscribing publicly to an anticapitalist stance, by refusing to translate for the dominant culture, by making the hidden ideologies explicit in the text, by manipulating the target text covertly *against* the original intent, and by producing noncommercial or alternative translations in support of minoritized groups (Baker & Chesterman, 2008; see www.babels.org).

Committed translation scholars have also focused their attention on how translators tend to work *within* the dominant gatekeeping system, and how they have intervened on foreign texts, distorting them to fit what they believe to be superior Anglo style. The Victorian poet-translator Edward Fitzgerald is a case in point. His cultural approach to translating a peripheral culture is writ clear: “It is an amusement for me to take what Liberties I like with these Persians, who (as I think) are not Poets enough to frighten one from such excursions, and who really do want a little Art to shape them” (Lefevere, 1992, p. 4). The result was the lauded, and very English, translation of *The Rubaiyat of Omar Khayyam*, and the inclusion today of many of Fitzgerald’s stanzas in the *Oxford Book of Quotations*.

Also well known in English are Rabindranath Tagore's own translations of his Bengali poems, for which he received the Nobel Prize in Literature in 1913—the first time it had been given to an Indian. Sengupta (1990, p. 58) suggests that this was due to his ability to efface his poems in translation and create “the stereotypical role that was familiar to the coloniser, a voice that not only spoke of the peace and tranquillity of a distant world, but also offered an escape from the materialism of the contemporary Western world.” And herein lies part of the problem: To be read and appreciated, the original voice may well be distorted by the “other” to fit a domestic mold, and “difference,” as a result, may well remain stereotypical, linked to a deterministic context of culture.

The postcolonial approach, then, is an attempt to break that mold, focusing on the hybrid nature of cultural, or rather “transcultural,” identity (Tymoczko, 2007, pp. 120–39). Postcolonial postmodernist theorists now use the term “cultural translation” to talk about individuals who have crossed these artificial cultural borders into a third space. Those who have done so are themselves, like British–Indian writer Salman Rushdie, “translated men” (1991, p. 17), freed from their original culture to write in their own terms, using their own brand(s) of foreignized English. However, cultural translation has little to do with the translating of texts.

Translation is involved, though, as Robinson notes (1997, pp. 88–113), when these transcultural voices are to be translated into other languages. He outlines three approaches: “literalism” (following House); “métissages,” the mixing of multiple races and ethnic language; and finally deliberate “mistranslations” from the dominant language. However, the last two approaches pose a fundamental problem for practicing translators and their readers. For there is little observable difference between a translation regarded as a text which has successfully subverted the established order, breaking the domestic mold, and one that is considered incoherent and “bad” due to its stilted language, signs of interference, and mistranslation. Indeed, the postcolonial approach has been criticized for its lack of utilizable methodology and its elitist approach, while Singh (2007, pp. 77–8) suggests that “perhaps it is time to take a RE-TURN to the study of language and renew the connection between translation studies and the study of language.”

Translating *Between* Cultures

The final approach to be discussed is indeed a return to language, focusing as it does on “intercultural communication”—a term popularly used in translation studies (e.g., by the International Association for Translation and Intercultural Studies and *The Translator*), though not always properly understood. For some translation scholars, intercultural communication is understood as equalling language-based “functional equivalence” (Bühlig et al., 2009, p. 1)—which takes us back to Nida's approach.

More relevant for translation is the interculturalists' view. First, “an intercultural situation is one in which the cultural distance between the participants is significant enough to have an effect on interaction/communication that is noticeable to at least one of the parties” (Spencer-Oatey & Franklin, 2009, p. 3); second, meaning is not innate in the text, but is constructed through filters according to contexts of situation and culture. This cultural approach focuses on difference between self and other in terms of communicability and in terms of reader *tolerance* of cultural distance.

The translator, here, first gauges the relative distances (in terms of cognitive environment, appropriacy, norms, values, and beliefs) between the source and target contexts of culture; and second, as privileged reader, negotiates levels of tolerance for difference according to original and new intentions. This requires bicultural competence and the ability to (dis)associate and take a third perceptual position (Katan, 2002).

Importantly too, in contrast with House, the concept of ideal or model reader (Eco, 1984) is essential here, for it is necessary to build a plausible model of both original- and target-reader reaction. Yet clearly this necessity is open to further criticism. Second-guessing reader reaction will lead once again toward determinism: the static view of individuals ready-labeled as belonging to idealized or model cultures. Hence the need for the translation to take place within the “mediation space,” as proposed by Wolf (2007, p. 113), open to new and evolving hybrid solutions, with the aim of *reconciling* differences according to text and readership tolerance for difference. The translator as a mediator also filters meaning according to her own, at times conflicting, “professional” or “committed” role to find out, indeed, “What is it that’s going on here?” between the two cultural worlds.

Cultural Awareness in Multilingual Education

MICHAEL BYRAM

"Cultural awareness," as a quick Internet search will show, is a widely used phrase and consequently has no single precise meaning. It is used to refer to awareness of diversity within a society and among societies. It is often associated with "training," involving specific activities which draw attention to diversity and encourage and deliberately develop positive attitudes and understanding. Such training is directed at adults in their professional and working lives. It is linked through this to "intercultural competence" which is based in part on heightened cultural awareness and which is itself fundamental to "intercultural communication." This field of activity and study is well enough established to have spawned "handbooks" (e.g., Straub, Weidemann, & Weidemann, 2007; Deardorff, 2009) and many textbooks (e.g., Holliday, Hyde, & Kullman, 2004; Jandt, 2004; Chen & Starosta, 2005).

In the field of multilingual education, the phrase "cultural awareness" can also be found in general use to draw attention to diversity within a society, and therefore within education systems. Learners are perceived as diverse because they speak a range of languages in their home and their environment outside school and, in the school, outside the formal curriculum, or because they adhere to various religions, or because they have different skin color, or some combination of these and related characteristics.

A more specialized use of the phrase than in the sphere of "training" or in education systems in general, is to be found in language education, especially where more than one language—whether "national" or "foreign"—is taught as a subject or used as a medium for teaching other subjects. This contrasts with "training" for cultural awareness which pays little or no attention to the relationship to language learning and proficiency.

It is in foreign language education that most precision in defining and understanding "cultural awareness" can be found, together with the discussion of the meaning of "culture" and the relationship of language and culture. Ultimately this means that "cultural awareness" is used as a starting point and a designation of an area of interest, and is replaced by other concepts and terms. It is the debates and discussions of these which are fundamental to the understanding of "cultural awareness."

The first issue is that of the relationship of language to culture and language to thought. The questions addressed are whether a language embodies a culture and whether a language constrains the thinking of those speaking it as their "native," dominant, or mother language. Definitions of "culture" abound and a much cited collection was made by Kroeber and Kluckholm (1952) whereas Williams traced the etymology of the word in English (1983) and a thorough recent overview is offered by Straub (2007b). The discussion of what distinguishes a native speaker from a non-native speaker is also frequent (e.g., Davies, 2003) as writers try to clarify the concept in order to help language teachers to decide what is correct and acceptable use of a language since, like teachers of all kinds, they have to set standards for their learners. The question of whether a language constrains the thinking of its speakers because of the particularities of its grammar has been discussed since the early 19th century when Humboldt argued that it did, and was renewed in the 20th

century by the American linguists Sapir and Whorf who also supported this view. The discussion distinguishes between a “strong” hypothesis that language absolutely constrains thought and a “weak” view that a language may influence the way people see and think about their world, but that they can learn to escape and see it through other languages. This issue is linked to the relationship of language and culture since one of the ways of defining culture is the thinking that individuals have and share about their world with others speaking the same language.

Much of this debate was originally based on what is now seen to be a simplistic perception of both language and culture as bounded and internally homogeneous entities. It was assumed that all speakers (and writers) of language X speak and write the same language and share the same culture X, which often has the name X, to be found in country X. This was probably only ever the case for a subgroup within the country X, that is, those with a high level of education, and the homogeneity was in fact a result of their shared educational experience. The fluidity of social life and the consequent changes in societies in the 20th century—not least as a consequence of social revolutions and large-scale migrations—have shown these assumptions to be false. People may be “native speakers” of several languages to different degrees, and possess several ways of thinking that they share with several different groups, large and small, of other people, that is, several cultures. Their situations may change radically over a lifetime and their languages and cultures too. Because fluidity and migration are new phenomena in contemporary history, they challenge language teachers in new ways, although many individuals will nonetheless remain in the same situation and speak and share only one language and culture throughout their lives.

The result of change for language teachers is to cast doubt on their traditional assumptions about language X. Can it be taught as a homogeneous entity spoken by all those who identify themselves with language X? Can they teach about country and culture X if its homogeneity is questioned? Their answer to the first question is easier because despite there being varieties of language X, it has usually been standardized in grammars and reference dictionaries. It is much more difficult for culture X since such standardization does not exist.

Risager (2006) has provided the most comprehensive and authoritative account, both historical and contemporary, of this debate. She argues that the relationship of language and culture needs to be analyzed in terms of social linguistic practice, of the individual’s psychological resources, and of language as a (standardized) system. In the first case, language and culture are separable since individual languages are used in many ways, contexts, and cultures, whereas in the second case language and culture are closely associated in the psychology of the individual. Risager develops Agar’s (1994) concept of “languaculture,” where language and culture are presented as inseparable, to refer to individuals’ experience. In the third case, a language can be described as a system but there is no corresponding systematic description of “culture.” It is not possible even in principle to envisage such a description, for example, in terms of a national culture. As a consequence she argues in a second book (Risager, 2007) that language teaching must go beyond the focus of language X in country and culture X to include the use of language X wherever it is found for whatever cultures it is used to embody.

In all of this, how to interpret the concept of culture is not lost from sight. The emphasis on a shared way of thinking may be complemented by analysis of artifacts—from music to architecture to literature to school curricula—as realizations of ways of thinking. It may also be complemented by an analysis of rule-governed behavior, that is, the conventions followed, or not, by people who share a way of thinking and Fox (2004), in her account of “watching the English,” would argue that these conventions are recognized by a national group, “the English” where the concept of “national culture” is retained.

Once it has been decided, by individual teachers or by curriculum designers, which approaches to take to the relationship of language and culture, the next series of questions arises. Shall learners study and analyze a foreign language and culture or shall they learn to use them as “native” like other speakers do? Shall they do both and if so to what ends? Shall study and analysis be focused only on the foreign language and culture or shall it include a comparison with the learners’ own language and culture? In short, shall the focus be on “knowing that” or “knowing how” (Ryle, 1949), or, if both, how shall they be linked?

In practice, the answers to these questions have shifted during the history of foreign language teaching in the modern era (i.e., since the late 19th century), from “knowing that” to “knowing how,” from emphasis on “knowledge” to focus on “competence.” This is part of a wider change in education systems from transmission of knowledge with curricula specifying what is to be learned to acquisition of competences with specifications of outcomes. Whether there is any substantive link between knowledge and competences or whether the concept of competences includes knowledge is part of a general debate about this shift (Fleming, 2009) and has also been controversial in theorizing about language learning. It is not well developed in theorizing about cultural learning although some models of cultural and intercultural competence include “knowledge that” as well as “knowledge how,” as we shall now see.

Models of cultural or intercultural competence have been developed as a response to the complexity of defining culture as knowledge or competence or some combination of both. Pedagogical models of competences can be useful for teachers in education systems or trainers in the world of work since they can help to specify aims and purposes, that is, what competences are to be taught—or “developed” if “teaching” is associated too closely with the transmission of knowledge—and why. Other models, which describe states or stages in the learners of reactions to their experience of other languages and cultures, can be used to identify outcomes which are not competences but attitudes. This latter approach is present in Bennett’s (1993) widely quoted model which suggests that people move—or should move—along a scale of reactions from ethnocentricity to ethnorelativity. Although this kind of model can be used to measure one kind of outcome, it does not offer help to teachers planning their curriculum and teaching methods.

A second kind of approach taken in psychology is to chart the possible sources of influences on people, usually children of school age, and their perceptions of and attitudes to cultural others. This is done most authoritatively by Barrett (2007) who has captured the interplay of the multitude of factors identified in empirical research in a societal-social-cognitive-motivational theory. This is useful to teachers because it contextualizes the role of education and demonstrates the power of other factors which they need to be aware of in their pedagogical planning.

Neither psychological approach specifies knowledge or competence nor does it help teachers to clarify the relationship between them. Second, and not surprisingly, these models do not help teachers or curriculum designers to clarify the purposes of teaching knowledge and competences. For the shift in emphasis from knowledge to competences, evident in all education including language teaching, is a challenge to the purposes of language education as well as to the methods used. Pedagogical models are needed to provide answers to questions of “why” as well as “what” and “how.”

A recent comprehensive analysis of models of intercultural competence is provided by Spitzberg and Changnon (2009) who have their own categorization of models: *compositional* models which simply list components crucial to success in interaction, *co-orientational* models which describe “interactional achievement of intercultural understanding,” *developmental* models which emphasize change over time whilst including definitions of components, *adaptation* models which describe the mutual adjustment required of people

in interaction, and *causal* models which identify the causal relationships among components. This last type would meet one of the criticisms of models presented by Straub (2007a) who argues that many models are weak because they do not specify whether components are necessary or sufficient, whether components are in some hierarchical relationship, whether they developed separately or together, in formal or informal learning, or whether they can be the object of systematic instruction. Again, though his criteria deal with questions of “what” and “how,” the issue of “why,” so important in educational settings, needs to be added.

It is the emphasis on competences that may lead to an omission of the “why” question in teaching foreign languages and cultures. The stronger emphasis on knowledge prevalent in the first half of the 20th century did not always introduce explicit answers to “why” either, and the most notorious example of an explicit purpose was found in Germany in the 1930s when the use of comparison of cultures in the study of foreign languages was enlisted in the glorification of German culture. Despite this misuse, it is comparison which is crucial to study and analysis as was already the case for classical languages (Bolgar, 1954). This is accepted by curriculum designers but needs to be accompanied by a critical self-awareness, the ability to examine the grounds of comparison and the evaluations which inevitably ensue. The term “critical cultural awareness” has been coined for this (Byram, 1997), a refinement of the more general term “cultural awareness” with which we began.

Cultural Capital

GAI HARRISON

The idea of “capital” commonly conjures up images of money or property, or alternatively a form of wealth that can be invested to grow more wealth. However, capital can also take a variety of noneconomic forms, which in turn can be used to gain access to other resources in the marketplace. The sociologist Pierre Bourdieu has been a key theorist in this regard. He has expanded on traditional understandings of capital to include nonmaterial forms, including cultural capital. In contrast to economic capital, Bourdieu (1986, pp. 243–48) defines cultural capital as the knowledge, qualifications, values, tastes, and other lifestyle factors acquired through the processes of socialization and education. Language, in the form of linguistic capital, is considered a type of cultural capital. For example, the way one speaks or the languages one speaks signifies a measure of cultural capital (Bourdieu, 1977, 1991). The possession of certain types of socially valued cultural capital may then allow a person to procure additional resources that can be translated into material wealth. In other words, under the right conditions cultural capital can be converted into other forms of capital. However, cultural capital is unevenly distributed and consequently it is implicated in the reproduction of inequality.

Bourdieu (1986) delineates three types of cultural capital. *Embodied* cultural capital is a product of education and socialization and encompasses an individual’s knowledge and skills. It includes one’s language competencies and leaves visible marks on the body, such as accent. In its *objectified* form, cultural capital comprises material objects such as art, books, or instruments. However, in order to make appropriate use of this form of cultural capital and realize its value, one needs the prerequisite embodied cultural capital, or “know-how.” The last form of cultural capital identified by Bourdieu is *institutionalized* cultural capital, which may take the form of credentials or qualifications. Institutionalization confers an objective value on cultural capital and allows for its conversion into economic capital, where its potential profitability also depends on its scarcity (Bourdieu, 1986, p. 248). At the same time, cultural capital such as language competencies have no real value unless they are deemed legitimate by dominant groups. Without this legitimization, cultural capital holds little symbolic value as a tradable asset (Bourdieu, 1991).

An individual’s cultural capital is evaluated according to social context, or the particular field in which these social relations are played out. Bourdieu likens a field to a group of players who all have an investment in the game, with some seeking to maintain the status quo and others striving to alter the distribution of capital or to have its relative value reassessed in order to ensure its recognition. In this sense, a field constitutes a site of struggle (Bourdieu, 1991). However, this does not mean that each player necessarily has a game plan. On the contrary, players in the field often do not consciously calculate their moves. Instead, they are predisposed to play the game in a certain way. Bourdieu terms this a person’s *habitus*, which refers to a set of deep-rooted dispositions or an orientation to the world. For example, a person’s linguistic *habitus* may be evident in a way of speaking which has been unconsciously acquired in the course of growing up, which also carries traces of his or her class position (Bourdieu, 1991, pp. 81–9).

Families and schools are primary sites for the transmission of cultural capital. Parents in particular are important conveyers of cultural capital, which is passed from one generation to the next. However, the acquisition of cultural capital may not occur on a conscious

2 CULTURAL CAPITAL

level and the way in which it is both acquired and transmitted is rarely visible (Bourdieu, 1986, p. 245). Cultural capital is also implicated in the maintenance and reproduction of class structures. Upper-class children who possess the “right” cultural capital can make good use of this in the education system, where it is recognized and rewarded.

A relationship is posited to exist between the investment families make in cultural capital and scholastic outcomes, which in turn is dependent on one’s social capital. Bourdieu (1986) defined social capital as an individual’s relationships, networks, and group affiliations. Social capital can be employed to “back up” cultural capital as it opens doors for people and allows them access to influential networks (Bourdieu, 1986, p. 244). However, in order to be put to good use, these personal connections need to be durable and signify the right credentials, such as being affiliated with a well-known family or school. In addition, a “closed club” mentality may be in operation where elite or more powerful groups fortify their boundaries to exclude those deemed to lack the appropriate social capital. This in turn limits their access to the elite group’s valued resources and prevents them from being able to capitalize on their own cultural capital.

These dynamics similarly play out in linguistic exchanges. Language competencies act as a form of capital that are differentially valued in the linguistic market and play a key role in regulating access to public resources and income (Bourdieu, 1977). In other words, some languages and language practices have greater buying power than others. The value of any particular language in the marketplace is tied to the worth of its speakers and the types of linguistic capital that are accorded high value are not equally available to everyone (Bourdieu, 1977). This process is moderated by the interests of dominant groups who determine the value of linguistic resources. In doing so, dominant groups “regulate access to other resources (such as knowledge, friendship, or material goods) and legitimate the social order that permits them to do so by masking (that is naturalizing) their ability to do so” (Heller & Martin-Jones, 2001, pp. 2–3).

The view that language operates as a form of differentially valued cultural capital which is an influential determinant of life chances is particularly salient in the contemporary global era. Globalization has increased opportunities for information exchange as well as enhancing cross-border mobility. In this current climate, language takes on greater economic importance where the ability to speak another language or use language in certain ways signifies a measure of cultural capital (Bourdieu, 1991, pp. 43–65). English, in particular, has come under the spotlight because of its global dominance in a range of activities, including business, information technology, and academic publishing. As a global language that is now the center of a vibrant growth industry, English is “marketed as a language of success, hedonism, and international mobility” (Phillipson, 2001, p. 2). Accordingly, it functions as a form of cultural capital that can be used to gain access to other resources in the marketplace.

For some individuals, making an investment in learning English has concrete dividends in terms of increasing work options, pay, and status. For native speakers, however, this cultural capital is inherited and they effortlessly enjoy more linguistic capital by virtue of the fact that “the ‘communication value’ of their language increases as others learn it as a foreign language” (de Swaan, 1998, p. 117). In some contexts this may promote asymmetrical relations between “native speakers” and those ascribed the status of “non-native speakers,” especially when these relations are reproduced in educational settings and the workplace. In these contexts, the embodied cultural capital of the native English speaker is accorded higher symbolic value than that of the non-native speaker (Pennycook, 2001, p. 125). In this regard, not having the right accent or speech style may mean that a person’s linguistic capital is devalued in the linguistic marketplace. This in turn illustrates how privileged groups may regulate access to cultural capital.

These inequitable social arrangements are similarly evident in countries where English was introduced via colonization. The prestige and status attached to speaking English in Hong Kong is a case in point here. Although Hong Kong's sovereignty was returned to China in 1997, English remains a sought-after form of symbolic capital, providing vital access to educational and economic resources and perpetuating class divisions (Lin, 2001; Chan, 2002). Its uneven distribution ensures that it acts as a type of cultural capital that is disproportionately available to privileged groups.

What these examples illustrate is that although everyone builds up a stock of cultural capital, it is not necessarily the case that the cultural capital one acquires is particularly valuable or will return concrete dividends. Indeed, "without the 'right' cultural capital, one cannot make connections, interact competently, or be taken seriously in certain places" (Schwalbe et al., 2000, p. 430). In the case of language, the "right" cultural capital usually constitutes those language practices that are afforded value and legitimated by dominant groups.

In summary, as a tool of analysis, cultural capital allows for an understanding of how linguistic interactions are implicated in both expressing and reproducing the social order. However, Bourdieu's ideas have been criticized in some quarters for being overly deterministic of the reproduction of the social order and dominant language practices, not recognizing the multiple manifestations of power, and negating the possibility for change (Pennycook, 2001, pp. 126–7). Nonetheless, in terms of its utility for applied linguistics, cultural capital provides a useful lens for examining the complexities of linguistic exchanges and how they are embedded in broader social and economic relations.

Cultural Hybridity

BIRGITTA FRELLO

The concept of (cultural) hybridity has gained prominence within a broad range of cultural and social theories since the 1980s, most notably within postcolonial studies, cultural studies, and globalization theory. The importance and influence of hybridity theory is thus closely related to an increased awareness of global cultural flows, influences, and interdependences, both historically and contemporarily. Furthermore, focusing on hybridity and hybridization is a way of conceptualizing difference that aims to avoid and undermine ideas of boundedness and closed identity and hence also avoid the essentialism that haunts theories of multiculturalism for instance.

The concept of hybridity is closely related to other concepts that are aimed to capture the mixture and interrelations between previously separate units or to overcome what is perceived as a problematic conception of clearly distinguishable cultural units. Examples of other concepts within the same field are creolization, syncretism, and transculture. Sometimes the concept of hybridity is treated as a general concept that designates the whole field, and sometimes it is treated as a specific concept among other concepts in the field, for example pointing to the field of cultural production, whereas creolization primarily deals with language and syncretism primarily deals with religion.

As several scholars have noted, the concept of hybridity is historically rooted in biology, referring to the interbreeding of species. This conceptual history also links the concept to the problematic legacy of racism and the fear of miscegenation and contamination of the white race in the era of colonialism (see Young, 1995, for a discussion). However, as has also been noted, the link to biology does not necessarily or exclusively connect the concept to racism and the ideas of purity, since cross-fertilization is also a positive means of development in biology (e.g., García Canclini, 2000).

The concept of hybridity primarily entered cultural theory through postcolonial studies. Here, the idea that hybridity not only constitutes a form of “mixing” but also entails a contamination of purity was turned upside down and developed into a critical gaze on conceptions of cultural and racial purity in colonial relations. This development was partly inspired by Mikhail Bakhtin’s discussion of hybridity in language and his analysis of the carnival (Bakhtin, 1981, 1984).

Some of the most renowned hybridity theorists, working within the fields of postcolonial studies and cultural studies, are Homi K. Bhabha, Stuart Hall, and Paul Gilroy. Despite differences, they all share a perspective that is critical toward notions of cultural and racial purity and that relates this critique to a critique of power hierarchies. Central to the work on hybridity by these—and other—theorists is that the concept and the problems that it addresses not only refer to a “mixture” of cultural elements with different origins, but also point to a displacement and disturbance of established identities. The concept of hybridity seizes the disturbing sense of ambivalence in the encounter with the other who is “almost the same, but not quite” (Bhabha, 1994, p. 86).

According to this line of thought, hybridity refers not only to the mixing of cultural elements but to the interdependence and basic impurity of the identities involved in the cultural encounter in colonial relations as well as in postcolonial migration. Hence, hybridity involves the destabilization of identities in encounters between colonizer and colonized

2 CULTURAL HYBRIDITY

as well as in postcolonial encounters when postcolonial migrants enter the former colonial centers. The result is an undermining of the construction of the “West” as the natural repository of truth and reason: “The displacement of the ‘centred’ discourses of the West entails putting in question its universalist character and its transcendental claims to speak for everyone, while being itself everywhere and nowhere” (Hall, 1996, p. 446).

Thus, to some extent the concept of hybridity as employed in postcolonial theory and in cultural studies stands in opposition to the concept of multiculturalism. Both share the effort to capture the complexities of a world marked by infinite encounters between people with different backgrounds and different worldviews. However, while “multiculturalism” often still maintains a notion of an independent existence of separate and bounded cultures prior to the encounter, “hybridity” is aimed directly at overcoming the notion of a prior existing bounded culture.

A later development in theories of cultural hybridity is found in theories of globalization. Although the two theoretical strands are not independent and not clearly discernible either, they do to some extent address different basic questions and rest on different theoretical insights, leading to different notions of the hybrid.

When the notion of hybridity is employed in theories of globalization, the concern is to grasp what happens to culture, cultural production, and identity in a world that is characterized by increasing cultural exchange both in terms of institutions and processes, such as media and migration, and in terms of ideas and cultural products and practices. The increased cultural, economic, and human flows across borders and continents fundamentally change the conditions of existence for cultures and cultural identities. Therefore, within globalization theory, the notion of hybridity is related to the discussion about the distinction between the local and the global and to other conceptual attempts to overcome this dichotomy and stress the interdependence and conflation of scales, places, and practices, notably Roland Robertson’s term “glocalization” (Robertson, 1995).

While the notions of the destabilization and denaturalization of hitherto taken-for-granted identities are central for theories of hybridity in postcolonial theory and cultural studies, the notion of “mixture” is more central in globalization theory. It is the (hybridizing) consequences of the very scope and speed of cultural exchanges that the concept is aimed to grasp. As in this quote from Nederveen Pieterse (1995, p. 53), in which he indicates the need of a theory of hybridization:

How do we come to terms with phenomena such as Thai boxing by Moroccan girls in Amsterdam, Asian rap in London, Irish bagels, Chinese tacos and Mardi Gras Indians in the United States, or “Mexican schoolgirls dressed in Greek togas dancing in the style of Isadora Duncan”?

The claim that it is necessary to theorize globalization in terms of hybridity is substantiated by arguing that globalization does not only involve a Westernization of the non-Western world. The influences are mutual and the result is not homogenization but hybridization. By focusing on the hybridization of culture, it is thus possible to grasp the complexities involved in the process of mutual adaptations and reinterpretations of cultural forms in the contemporary world.

However, the usefulness of the concept of hybridity in cultural theory is not without opponents. The main critiques focus on the claim to overcome essentialism and on the relation to power and social critique (e.g., Friedman, 1997, 1999; Hutnyk, 1997). The concept of hybridity is primarily employed in order to counter conceptions of purity, be it by focusing on the denaturalization of hitherto taken-for-granted identities, as in postcolonial theory and cultural studies, or by focusing on the accelerated blending of cultural forms

as in globalization theory. Nevertheless, one of the main and most persistent lines of critique against the use of the concept is that it presupposes and reproduces the same essentialist notion of culture and identity that it sets out to criticize, since in order to identify something as “mixed” one needs to presume a preexisting pure form. Another line of critique focuses on the question of power. In postcolonial studies hybridity is often seen as a critical moment in a world in which power differences rest on notions of purity. However, according to the critics, this celebration of mixing goes very well with dominant global power interests of today. Thus, celebrating hybridity may support power hierarchies as much as it challenges them.

It can be contested whether these critiques always hit their target. The field of hybridity theory is complex and internally characterized by disagreements and differences, and the problems that Friedman, Hutnyk, and others criticize are discussed at length also within the field of hybridity theory itself (e.g., Ang, 2001). Notwithstanding the critique, the introduction of hybridity in cultural theory has contributed to highlighting processes and relations that have been left largely out of sight in traditional cultural theory. Thus, cultural hybridity not only refers to the mixing of cultural elements. It is a term that is employed in various ways in order to conceptualize and critically engage with relationships between notions of purity and impurity in a cultural–historical perspective. It is “a heuristic device for analysing complicated entanglement,” as Ang (2001, p. 17) puts it.

Cultural Identity

JOHN E. JOSEPH

Identities are manifested in language, first, as the categories and labels that people attach to themselves and others to signal their belonging; second, as the indexed ways of speaking and behaving through which they perform their belonging; and third, as the interpretations that others make of those indices. The ability to perceive and interpret the indices is itself part of shared culture. Every individual has a repertoire of identities of various kinds—some combination of national, ethnic, religious, generational, and gender identities, together with those relating to social class, sexual orientation, profession, and various levels of sub- and supranational belonging.

The term “cultural identity” is sometimes applied to some or all of those just named above, while at other times it is reckoned to be a distinct category. On the one hand, culture and identity are never entirely separable: It is a defining trait of the concept of culture that whatever beliefs, values, inclinations, tastes, practices, and texts constitute it must also serve an identity function for those who participate in the culture. On the other hand, no group can be expected to be culturally homogeneous; the urge to tribalize is too deeply rooted in human nature, indeed its ubiquity in animal behavior testifies to how deep it runs in our evolutionary heritage. So, for instance, within Islamic religious identity there are different ways of ‘being Muslim’—in other words, a variety of Islamic cultural identities, subsumed under the umbrella of a religious identity that itself admits of variants: Sunni and Shia, and, within the latter, Sufis, each with their distinctive practices and texts, even if most of their central beliefs are the same.

Cultural identities rarely carry great imaginative power unless they are textualized as national or racial/ethnic identities. People do not go to war for their culture in the way they willingly die for their fatherland or their people, or other “imagined communities” which they perceive as being *naturally* constituted, rather than just arbitrary, contingent cultural constructs (Anderson, 1991). And yet, it is not provable that any race or nation is a “natural” entity; all are at least partly constructed, and, at the same time, as Mary Catherine Bateson has pointed out, “Everything is natural” (Bateson, 1995). Gender identities might seem to be directly linked to the physical configuration of reproductive organs, and yet people are readier to accept that an individual is a “woman trapped in a man’s body,” or vice versa, than they are that someone is a Japanese trapped in an Ethiopian’s body.

The idea that the existence of communities is largely textual has not simply been invented by academics. The essentially cultural nature of race was established in law by the British House of Lords in 1983, in the case of *Mandla v. Dowell Lee* [1983] 2 AC 548, in which a Sikh boy won the right to wear his top knot and turban despite its violating his school’s uniform code. The opinion stated that a number of criteria make a race, of which two are essential:

1. a long shared history, of which the group is conscious as distinguishing it from other groups, and the memory of which it keeps alive; and
2. a cultural tradition of its own, including family and social customs and manners, often but not necessarily associated with religious observance.

2 CULTURAL IDENTITY

In addition, five further conditions were determined to be “relevant” but not essential:

3. either a common geographical origin or descent from a small number of common ancestors;
4. a common language, not necessarily peculiar to the group;
5. a common literature peculiar to the group;
6. a common religion different from that of neighboring groups or from the general community surrounding it; and
7. being a minority or being an oppressed or a dominant group within a larger community.

Sikhs were given recognition as a race under the law by virtue of being “a distinctive and self-conscious community . . . although they are not biologically distinguishable from the other peoples living in the Punjab.” A crucial piece of evidence for their distinctiveness lay in a surprisingly fine-grained fact about their literary language, Punjabi: “They have a written language which a small proportion of Sikhs can read but which can be read by a much higher proportion of Sikhs than of Hindus.” The law recognizes that race is not a genetic given but a cultural, historical, textual, and linguistic construct. What differentiates it from, say, religion, is the physical nature of the signs by which it is interpreted—skin color, hair texture, the shape of facial and other bodily features. But these things are never fixed. They overlap, as we should expect them to do given that people have always tended to marry outside their genetic group. Indeed many cultures require exogamy. And the interpretation of racial features itself takes place within a culture-specific context.

Among the constituent elements of cultural identity, shared tastes and inclinations are more bodily and emotional in orientation, while shared beliefs and values are mental and rational. But none of these tastes, inclinations, beliefs, or values is directly observable, apart from in oneself through introspection. All we can observe in others is *practices* and *texts*, from which we infer the other elements. Ethnographic analysis proceeds therefore as though cultures are made up of practices and texts. The practices include how food is obtained and prepared, how clothing is made and decorated, patterns of marriage and family arrangements, how trade is carried out and how worship is conducted. Often these practices are encoded in or bound up with texts, either in the narrow sense of written texts or oral tradition, or the broader one of visual texts, including paintings, statues, and other totemic figures, tattoos, jewelry, songs and chants, dances, and the like.

Language is a practice—the systematic signifying practice of a particular group—through which texts are made. Language is itself also a text, inasmuch as those who share the practice of a particular language inevitably discuss what is the right or the better way of saying something, make certain expressions taboo, and otherwise engage in the sort of metatalk about the language that gives it a kind of social and cultural reality. The very concept of “a language” arose historically only after, and in conjunction with, the practice of writing. In the modern world the culture of language has been centered around two particular types of texts: the lexicon and the grammar; such is their power that even scientific linguists, led by Chomsky, have ended up projecting these two text types into the brain, as modules of mind that supposedly have a physical (hence universal) basis. However, in doing so these linguists have closed their eyes to the metaphorical nature of their projections and the fact that they are based on cultural textual artifacts.

Identities, whether of an individual or of a community, are not a given. They have to be forged—created, transmitted, reproduced, performed—textually and semiotically, that is, through signs. Language being the ultimate semiotic system, every identity ideally wants a language of its own. Not a wholly new language, but at least some segment of the vocabulary that insiders can use to distinguish themselves from outsiders. Joseph (2006) argues that this is a much more significant factor in language change than historical linguists

have been prepared to admit. For every identity a time comes when a new generation wants it updated. New words, signs, and texts are admitted, often by hybridization with some more recent and vibrant identity.

Silverstein (2003) has developed an approach to the analysis of the “indexicality” of language that attempts to capture how cultural meanings—on the level of ethnicity, class, gender, or any number of other factors—are encoded in and interpreted from utterances. He regards linguistic communication as containing a vast complex of indices, operating on various levels, from those of word meaning to the pragmatics of communicative “face,” to the various forms of micro- and macrosocial indexing that constitute linguistic identity. His contention is that these levels are not positioned either haphazardly or even on a par with one another, but are ordered hierarchically. Whatever level of indices one may be analyzing (which Silverstein calls *n*), there is always a next higher level (*n* + 1) that will emerge from how *n* is used in communication. So, for example, my choosing to address someone with informal *tu* or formal *vous* in French indices my perceived relationship to him or her (level *n*), but also has immanent within it the potential for me to be indexed by others for what my pronoun choice says about me (level *n* + 1). This structured indexicality produces “registers,” “alternate ways of ‘saying “the same” thing’ considered ‘appropriate to’ particular contexts of usage” (Silverstein, 2003, p. 212), and within which culturally specific meanings are “enregistered” (for a particular application, see Agha, 2003).

Blommaert (2007) has contested Silverstein’s approach on the grounds that it focuses too much on the linguistic sign, rather than on the social institutions that transmit and reproduce the orders of indexicality. Indexical order cannot explain why an individual’s linguistic behavior is regular enough to be identifiable as his or her own. For Blommaert (2007, p. 117), “Register” can be characterized as follows: “clustered and patterned language forms that index specific social personae and roles, can be invoked to organise interactional practices used for typifying or stereotyping. Speaking or writing through such registers involves insertion in recognisable (normative) repertoires of ‘voices.’” The current debate among linguistic anthropologists is to what extent these indices are precise and fixed or “constitute a field of potential meanings—an indexical field, or constellation of ideologically related meanings, any one of which can be activated in the situated use of the variable” (Eckert, 2008, p. 453).

Cultural identity poses problems within cultures as well as between them, for instance, on the ethical and political level, issues of multiculturalism and multilingualism. Appiah (2005) distinguishes between a “hard” pluralism that takes very seriously the ethical imperative for allowing dissenters to opt out of the group culture into which they were born, and a “soft” type, inclined to see the group as the most important unit where autonomy is concerned, and to insist that individuals cannot have real autonomy except as part of their group belonging. Appiah challenges Kymlicka’s (2001) faith in a distinction between exogenous and endogenous change, with the latter being a valid way for a culture to evolve, by raising the thorny case of arranged marriages within South Asian families in the UK. If younger members of the culture want to choose their own partners, is this an exogenous British value that should be resisted in the interest of cultural preservation? Appiah concludes that

when multiculturalists like Kymlicka say that there are so many “cultures” in this or that country, what drops out of the picture is that every “culture” represents not only difference but the elimination of difference: the group represents a clump of relative homogeneity, and that homogeneity is perpetuated and enforced by regulative mechanisms designed to marginalize and silence dissent from its basic norms and mores. (Appiah, 2005, p. 152)

4 CULTURAL IDENTITY

On the more theoretical level, cultural identity poses the problem of how it is that even individuals who are not dissenters within their particular cultural identity nevertheless possess agency and make choices that they perceive to be free, while at the same time recognizing that those choices are partly shaped by the culture of which they are a part. Gramsci's (1971) theory of hegemony is an attempt to explain the cultural shaping as a political imposition, while warning that the perception of agency may be an example of "false consciousness." And yet such a strong form of hegemony cannot explain how it is, for example, that, despite having as strong a cultural indoctrination apparatus as has ever existed, the Soviet Union and its satellite states were not able to control the choices of their citizenries and eventually collapsed, to be replaced by the capitalism which they had spent 70 years building and enforcing a culture aimed at demonizing. Bourdieu's (1991) theory of the individual as "habitus," making choices guided by inclinations inculcated into us since early childhood, is an attempt at striking a balance between individual agency and the field of social and cultural forces in which that agency is situated.

Cultural Linguistics

FARZAD SHARIFIAN

Introduction

In the broadest sense of the term, “cultural linguistics” refers to the subbranch of linguistics that explores the relationship between language and culture. More specifically, it attempts to understand language as a subsystem of culture and examine how various language features reflect and embody culture. “Culture” here is meant in the anthropological sense, that is, as a system of collective beliefs, worldviews, customs, traditions, values, and norms shared by the members of a cultural group. Research on the relationship between language and culture has significant implications for areas in applied linguistics that require an understanding of language as a system firmly grounded in culture. These areas include intercultural communication and teaching/learning foreign languages.

Interest in studying the relationship between language and culture is not new. It can be traced back at least to the 18th century. Wilhelm Von Humboldt (1767–1835), Franz Boas (1858–1942), Edward Sapir (1884–1939), and Benjamin Whorf (1897–1941) are prominent scholars who all emphasized the relationship between language, thought, and culture. The most well-known and controversial view in this area is known as the Sapir–Whorf hypothesis, and is based on the work Sapir and Whorf conducted on the Hopi languages of America. They concluded that speakers of different languages think differently and have different views of the world. They argue that, since different languages “dissect” the world differently, the structure of the language spoken determines the thought patterns of the speaker. A milder version of this hypothesis, known as the weak version, simply states that language, thought, and perception are interrelated.

In more recent decades, a number of American anthropological linguists, most notably Dell Hymes and John J. Gumperz (e.g., Gumperz & Hymes, 1972), placed the study of language within the context of culture and society. Hymes and Gumperz, and Hymes in particular, established a framework for the ethnography of communication, or culturally distinctive means of communication.

Cultural Linguistics as a Branch of Cognitive Linguistics

The term “cultural linguistics” was perhaps first used by a pioneer of cognitive linguistics, Ronald Langacker, in an argument emphasizing the relationship between cultural knowledge and grammar. He maintained that “the advent of *cognitive linguistics* can be heralded as a return to *cultural linguistics*. Cognitive linguistic theories recognize cultural knowledge as the foundation not just of lexicon, but central facets of grammar as well” (Langacker, 1994, p. 31, original emphasis). However, in practice, so called “mainstream” cognitive linguists were united by their main focus on exploring the relationship between language and conceptualization. The role of culture in shaping language and its influence on all levels of language was not adequately dealt with until the publication of *Toward a Theory of Cultural Linguistics* by Gary B. Palmer, a linguistic anthropologist from the University of Nevada, Las Vegas. In this book, Palmer argued that cognitive linguistics can be directly applied to the study of language and culture. Central to Palmer’s proposal is the idea that

"language is the play of verbal symbols that are based in *imagery*" (Palmer, 1996, p. 3, emphasis added), and this imagery is culturally constructed. Palmer argued that culturally defined imagery governs narrative, figurative language, semantics, grammar, discourse, and even phonology. His work on cultural linguistics, based on the analysis of cases from languages such as Tagalog and Coeur d'Alene (e.g., Palmer, 1996, 2003), revealed how the basic analytical tools of cognitive linguistics, such as "schema," "image schema," and "conceptual metaphor," can be grounded in cultural knowledge.

The notion of "schema" has been very widely used in several disciplines, and this has led to different understandings and definitions of the term. For cognitive linguists such as Langacker, schemas are abstract representations in the sense that a noun, for example, instantiates the schema of [[THING]/[x]], whereas a verb instantiates the schema of [[PROCESS]/[x]]. In classical paradigms of cognitive psychology, however, schemas are considered more broadly as building blocks of cognition used for storing, organizing, and interpreting information. Image schemas, on the other hand, are regarded as recurring cognitive structures which establish patterns of understanding and reasoning, and are often formed from our knowledge of our body as well as social interactions (e.g., Johnson, 1987). An example of this would be to understand the body or parts of the body as a *container*. Such understanding is reflected in expressions such as *with a heart full of happiness*. Conceptual metaphors are defined as cognitive structures that allow us to understand one conceptual domain in terms of another. For instance, the English metaphorical expression *you broke my heart* reflects the conceptual metaphor of HEART AS THE SEAT OF EMOTION (e.g., Lakoff & Johnson, 1980). Palmer persuasively argued that all these conceptual structures are very likely to have a cultural basis.

A number of other linguists have also emphasized the relationship between language and culture, most notably Wierzbicka (1979), who introduced the term "ethno-syntax" (see also Wierzbicka, 1992; Enfield, 2002). Mathiot (1979) edited a collection of essays, which she called *Ethnolinguistics*, in which contributors explored the relationship between language and worldview. *Ethnosemantics* has been a subfield of anthropology since at least the 1960s, and the aim of ethnosemanticists has been to study "the ways in which different cultures organize and categorize domains of knowledge, such as those of plants, animals, and kin" (Palmer, 1996, p. 19). Goddard, a close associate of Wierzbicka, edited a volume entitled *Ethnopragmatics: Understanding Discourse in Cultural Context* (Goddard, 2006). In this book contributors provided a culture-internal perspective toward speech practices across different languages. Another influential trend of work on the relationship between language and culture has been what might be described as the social-anthropological/sociolinguistic approach, influenced by the work of scholars such as Michael Agar. Agar (1994) used the term "languaculture," following Paul Friedrich's (1989) "languaculture," to describe the relationship between language and culture. For Agar, "langua" relates to discourse, not just words and sentences, and culture underlies meanings. This work is further developed in Risager's (2006) treatment of "global flows and local complexity," where she explores the intricate relationship between language and culture from a transnational perspective, presenting a critique of simplified accounts of language and culture. This view emphasizes the fact that "[l]inguistic and cultural practices change and spread through social networks along partially different routes, principally on the basis of transnational patterns of migration and markets" (Risager, 2006, p. 2). All these enterprises can be subsumed as part of the broad discipline of cultural linguistics.

Palmer's proposal for a theory, or perhaps "paradigm," of cultural linguistics inspired a number of cognitive linguists to examine in depth the grounding of language in culture. For example, one of the main strands of research within cognitive linguistics is to explore how a conceptual metaphor is grounded in bodily experience (e.g., Lakoff & Johnson, 1980). Within this area, those who adopt a cultural linguistic perspective explore how such

conceptual metaphors are different from language to language and how such conceptualizations have their roots in particular cultural traditions such as ethnomedical belief systems (e.g., Sharifian, Dirven, Yu, & Neimier, 2008; Yu, 2009a, 2009b).

The theoretical direction that Palmer initiated has been further developed in the work of Sharifian (2011), in the form of a multidisciplinary framework that draws on theoretical advancements in several disciplines and subdisciplines, including cognitive linguistics, cognitive anthropology, cognitive psychology, complexity science, distributed cognition, and anthropological linguistics. This framework, termed *cultural conceptualizations and language*, views language as firmly grounded in a group-level cognition that emerges from the interactions between the members of a cultural group. Two important aspects of cultural cognition are *cultural conceptualizations* and language. Cultural conceptualizations are defined as conceptual structures such as “schemas,” “categories,” and “conceptual metaphors,” which not only exist at the individual level of cognition but also develop at a higher level of cultural cognition, where they are constantly negotiated and renegotiated through generations of speakers within a cultural group, across time and space. These cultural conceptualizations are *heterogeneously distributed* across the members of a cultural group, in the sense that individuals do not exactly share all the elements of the conceptualizations that are drawn upon by the entire group. Language is a primary means for encoding and communicating cultural conceptualizations, serving as a memory bank for the cultural conceptualizations of a particular cultural group.

Examples of the Grounding of Language in Cultural Conceptualizations

To cite an example of the grounding of language in cultural schemas, everyday words such as “family” and “home” are, when used in Aboriginal English, associated with Aboriginal cultural schemas and categories. The notion of “family” lends itself to complex systems of categories and schemas in Aboriginal English which may be opaque to Anglo-Australians (Sharifian, 2011). The general cultural category of Family, to start with, usually moves beyond that of nuclear family and captures the extended family including cousins, cousins of cousins, and so on. Subcategories such as “father,” “mother,” “aunt,” and “uncle” may include people whom an Anglo-Australian would categorize as “second cousins.” Aboriginal kinship systems are “classificatory” systems (Tonkinson, 1998), where, for example, the term for “father” might refer to one’s father as well as father’s brothers, and the term for “mother” may refer to one’s mother as well as mother’s sisters and, in some cases, mother’s brother and even mother’s cousins. The corollary is that one’s cousins are thus considered and called “brother” and “sister,” or “cousin brother” and “cousin sister.”

At the schema level, each of these categories is associated with complex schemas that embody knowledge about behavior and obligation. Each kin term “carries with it the obligation to observe certain behavioral rules known to all, and this makes it easy for the interaction to proceed along well-defined lines, regardless of whether the person encountered is loved or hated, admired or feared” (Tonkinson, 1998, p. 151). The Aboriginal cultural schemas of Family embody behavioral rules such as restraints relating to “touching, joking, calling by name, direct eye contact, the passing of objects from hand to hand, visiting other person’s camp, argument, sexual innuendo and physical assault” (Tonkinson, 1998, p. 153).

As an example of how cultural conceptualizations can govern syntactic devices, cultural classification in the Australian Aboriginal language Murrinh-Patha requires 10 noun classes (Walsh, 1993). These classes are identified through noun class markers appearing before the noun. The following list gives the class markers with their associated category (Walsh, 1993, p. 110):

4 CULTURAL LINGUISTICS

1. *kardu*: Aboriginal people and human spirits;
2. *ku*: non-Aboriginal people and all other animates and their products;
3. *kura*: potable fluid (e.g., “fresh water”) and collective terms for fresh water (e.g., “rain,” “river”);
4. *mi*: flowers and fruits of plants and any vegetable foods; also faeces;
5. *thamul*: spears;
6. *thu*: offensive weapons (defensive weapons belong to *nanthi*), thunder and lightning, playing cards;
7. *thungku*: fire and things associated with fire;
8. *da*: place and season (e.g., “dry-grass time”);
9. *murrinh*: speech and language and associated concepts such as song and news;
10. *nanthi*: a residual category including whatever does not fit into the other nine categories.

This system of noun classification is entrenched in Murrinh-Patha cultural conceptualizations. Walsh argues the fact that fresh water, fire, and language have separate classes indicates the prominent place each holds in the culture of the Murrinh-Patha. These examples clearly reveal how language can serve as an archival site for cultural conceptualizations, whether or not such conceptualizations remain at the conscious level of the speakers.

Applications of Cultural Linguistics

Palmer’s proposal for cultural linguistics also inspired studies that have applied “cultural linguistics” to areas such as intercultural communication and second language learning. A theme session entitled “Applied Cultural Linguistics” was organized as part of the Eighth International Cognitive Linguistics Conference, University of La Rioja, Spain, in 2003. This led to the publication of an edited volume with the same title (Sharifian & Palmer, 2007). The contributions to this volume focused on Japanese, Chinese, Arabic, Persian, English, Aboriginal English, and African English. The studies in this volume collectively provided evidence about how learning a second language (or language variety) involves learning a new conceptual system including new cultural schemas, conceptual metaphors, and image schemas. For example, the chapter by Ning Yu explored the Chinese conceptualization of the heart in the context of traditional Chinese medicine and philosophy (see also Yu, 2009b). Yu maintains that the Chinese cultural model of the heart gives rise to metaphors that profile the heart as a physical entity (e.g., THE HEART IS A CONTAINER), a part of the body (e.g., THE HEART IS THE RULER OF THE BODY), and the locus of affective and cognitive activities (e.g., THE HEART AS THE HOUSE OF ALL EMOTIONAL AND MENTAL PROCESSES). He contrasts this conceptualization with the heart–mind dichotomy, which characterizes Western cultures. Thus, Yu demonstrates that cultural schemas rival bodily schemas as sources of conceptual metaphors. As for the implications of his observations, Yu draws on the notions of *conceptual fluency* and *metaphorical competence* developed by Danesi (e.g., 1995). The notion of “metaphorical competence” was proposed as an addition to the more traditional notions of “communicative competence” and “linguistic competence.” The idea is that the metaphorical basis of the language-to-be-learned, which is largely derived from cultural models, should be made explicit to the learners to help them achieve fluency at the cultural–conceptual level. In the case of L2 learners of Chinese, Yu maintains that a clear delineation of Chinese conceptual metaphors, such as those associated with the heart, facilitates second language learning and enables L2 speakers to avoid misunderstanding in intercultural communication.

A cultural-linguistic approach has also recently been adopted by the study of intercultural communication. For example, Sharifian (2010) explored intercultural communication between Aboriginal and non-Aboriginal Australians and observed how lack of familiarity with the cultural conceptualizations that interlocutors draw on during intercultural communication can lead to miscommunication, severely disadvantaging speakers from less powerful groups in contexts such as the courtroom and the classroom. The following is an example cited in Sharifian (2010) from a real-life conversation with a speaker of Aboriginal English, who was drawing on an Aboriginal spiritual cultural schema: "A: My sister said, 'When you go to that country, you not allowed to let 'em [them] take your photo, they can sing you.'" The word "sing" in the above sentence instantiates the Aboriginal cultural schema of "singing," according to which, when a man has fallen in love with a girl, he may try to obtain some strands of her hair, a photo, or something similar in order to "sing" her, a ritual incantation. "Singing" is supposed to make the girl turn to the person who had "sung" her, and refusal to do so may cause her to suffer a serious or even fatal illness. Unfamiliarity with this cultural schema would confuse or create misunderstanding in interlocutors listening to the statement quoted above.

In addition to the areas of applied cultural linguistics discussed above, Sharifian (2011) presents several studies where he has adopted the framework of cultural conceptualizations to explore topics of an applied nature in cross-cultural pragmatics, English as an international language, and political discourse. His in-depth study of compliment responses in Persian reveals how the enactment of speech acts can dwell in cultural schemas that have long been developed as part of the cultural cognition of a speech community. As for the use of English as an international language, it is observed that English is increasingly adopted by communities of speakers around the world to express their cultural conceptualizations, instead of those of Anglo-English speakers, and this fact has serious ramifications for the field of English language teaching (ELT). In the area of language and politics, discourse produced by politicians and about politicians and political events often makes heavy use of culturally constructed figurative language, particularly metaphor and metonymy. When such discourse is literally translated, the result is often an intentional or inadvertent misrepresentation of the original discourse. Overall, the approach of cultural linguistics to applied areas of inquiry appears to be very promising, although at this stage such studies have just begun to appear. John Benjamins has recently launched a new book series with the title of *Cognitive Linguistic Studies in Cultural Contexts*, which promotes and disseminates research in cultural linguistics.

Cultural Representation

GENEVIÈVE ZARATE

As a concept, *cultural representation* is first and foremost a product of the field of social psychology and is particularly known to be a key concept in cultural studies (Hall, 1997). However, in the Europe of the 1990s when ideologies of the Cold War were crumbling and the old continent was equipping itself with a language and educational policy (Treaty of Maastricht, 1992), the concept found its way into the field of applied linguistics and language pedagogy. Departing from conventional discourses of the time which emphasized the articulation *one language equals one culture*, the concept of *cultural representation* opened up a discussion on the perception of the Other in the field of languages, thus offering new perspectives when compared to debates which are centered on the strict acquisition of a specific language system. The concept spearheaded the raising of questions such as “What are the learner’s representations when s/he starts to learn a language?” “Have an advanced learner’s representations evolved during his or her learning period?” “How does a teacher’s representations affect his or her learner’s?” (Byram & Risager, 1999). The concept therefore makes possible the establishment of an epistemological link between a learner and a teacher, between a learner and a native speaker, and the plurality of modes of social identities.

The concept offers answers to the debates surrounding the interpretation of facts relating to a foreign culture and its articulation with the competences expected of a foreign language learner. It is not the same thing as the notion of “viewpoint,” which tends to pitch one point of view against another and to promote cultural relativism. Originating from the social sciences, the concept of *representation* clearly invites the interpreting person to abandon the idea of a “true culture” altogether and to consider the rapport with reality in the form of a dialectical relationship which engages the opinion and the mode of socialization of the person who has to interpret the foreign reality (Zarate, 1993; Kramsch, 2009).

Cultural representation questions the qualitative relationship that every learner or speaker has with a language which up till then was commonly supposed to be based on or to lead to positive representations within a school-based teaching of a language. By questioning the background of a xenophobic relationship, the concept opens up the horizon of applied linguistics to identity tensions, resistances to cultural difference, or to historical, geopolitical, and ethnic conflicts which feed national or regional memories and encourage a negative relationship with the language of the menacing neighbor or enemy. One observes that precedence is given to these questions within the field of less commonly taught languages (LCTL), where these negative presuppositions lead to the petering out of candidate-learners when they are directly hit by the repressive steamroller of the more commonly taught languages, especially English, the international and undisputed language of social mobility. Questions on the qualitative relationship that each one has with languages, whether learnt at school or not, are also beginning to be asked around the language or languages of the family, which can be seen as a social stigma and a barrier to social mobility when intergenerational transmission is interrupted within the same family.

Finally, the increasing number of travels abroad during university training—especially within the European ERASMUS program (Murphy-Lejeune, 2001)—contribute to a true-to-life laboratory for observing the effects of negative representations when the relationship with the Other is no longer the object of an idealized or school-style teaching; depending

2 CULTURAL REPRESENTATION

on the time of the foreign sojourn, eating and hygiene habits may brush aside the cultural schemes within which the learner has been socialized.

These questions arise through the sense of cultural difference, which is increasingly concrete and intense, given the accelerated geographically diversified circulation of goods and persons in a world that has become globalized. Languages seem less foreign, the categories that are commonly used to classify them into mother tongues, second or foreign languages having shown their limits once the geographical space no longer correlates with national entities, but is associated with a globalization that is both present all over the planet and visible right from the local level.

The pedagogical models that have influenced thoughts on languages during the second half of the 20th century, especially the Communicative Approach, are on the decline, when compared to the present complexity fed by cultural representations. Consequently, it is worth noting that the Common European Framework of Reference (CEFR, Council of Europe, 2001), although a major European tool circulated and commented on outside Europe, is henceforth no more than a worn-out extension of the Communicative Approach, since it has not integrated these economic and geopolitical changes as well as the concept of *cultural representation* in its set-up. One challenge that has not yet been dealt with is that of the progression of learning cultures and how to evaluate them by integrating the weight and the evolution of these representations in a systematized description. The debate on the assessment of intercultural competences is divided along the lines of whether or not to take them into consideration. Byram proposes to limit progression to three of the six levels of the CEFR and thus combine communicative with intercultural competences (Byram, 1997). Zarate and Gohard-Radenkovic (2004) suggest accepting the difference between both dimensions and propose the notion of “recognition” of intercultural competences, by stressing the fact that representations cannot be an object of evaluation and can evolve at a pace that is different from that of linguistic competences.

Pedagogical breakthrough made in the description of representations was not recorded in the CEFR. Yet, accusing fingers were pointed at “stereotyped representations” right from the 1980s, especially in school manuals not known to have abandoned an easy route of tourist clichés and a backward and outlandish outlook as far as the culture taught was concerned. The distinction between “auto/self-representations” and “hetero-representations” is also a useful lever with learners. “Hetero-representations,” or representations one has of another, have been explored by the cultural institutes charged with the responsibility of promoting their language outside their national frontiers (Goethe Institut, 1988; Istituto italiano di cultura, 1997). By producing a selection of amusing press cartoons taken from the media of the learner’s country concerning the country whose language is being taught, and putting them side by side, these pedagogical tools give rise to a large number of clichés, representing the Other through faults or qualities based on public opinion, or “collective representations.”

Parallel presentation of “crossed representations” of the Other is a simple and effective tool to help show the falsifying power of stereotype, but it can be undermined if the teacher insists, in a superficial way, on listing a catalogue of stereotypes or on approaching them in a playful manner. “Auto/self-representations” or representations that one has of one’s own community are a more advanced stage of being aware of these phenomena. They call for a deep examination of one’s opinions, including those on a subject that is thought to be mastered, like the subject of a speaker’s own culture.

Raising language teachers’ awareness during their initial training or during continuing education is a powerful tool for making them conscious of these effects. Cultural awareness that has been carved out of keeping a distance as far as representations of a family’s daily routine is concerned, and especially as far as the modalities of one’s own socialization is concerned, acquired the status of a full-fledged competence in the 1990s.

Representations of the Other can be approached not only from a binary perspective—the ones circulating in the learner's country on the language being taught and those circulating about the learner's country in the country or countries that are emblematic of the taught language—but also within a plurilingual perspective. This suggests that language should not be considered as the only emblem of a nation but also as a social connector, sign of the complexity of a speaker's affiliations to a set of linguistic and social communities.

The reflexive dimension, at the core of cultural awareness, supposes an individual's ability to distance him- or herself from the place that languages, including a speaker's mother tongue, occupy in the course of one's life. The ethnographical diary (Fleming & Byram, 1998) and the learning diary are tools that enable learners to put into words representations and to reread the manner in which they were built over a period, covering an individual's or a family's story, which is always singular. With their multidimensional background and plurilingual perspective such documents therefore associate interrogations on mother tongues and national languages with foreign languages either learnt at school or during a nonschool experience. In this sense, one would talk of a link between "social representations" and discourses on languages (Moore & Py, 2010, pp. 271–327). When this complexity is apprehended through discourses that mediatize the relationship with social reality (manuals, dictionaries, films, advertisements, national hymns, especially when used as class materials), one can speak of "cultural representations" (Maurer & Londei, 2010, pp. 219–67).

Methodological presuppositions of the social sciences obviously call for the abandonment of immediate evidence, for the "truth" of social realities, and for making a critical review of a personal experience whose aim would be to question ordinary knowledge, these being necessary conditions for creating instructional manuals of social reality and for interpreting the way the whole society functions. Cultural representations are therefore a call for the widening of the disciplinary scope of applied linguistics beyond its founding principles.

Cultural Studies

OVE SERNHEDE

Today, research on and theoretical studies in the field of “culture” are amongst the most expansive areas in the social sciences and the humanities. Interdisciplinary institutes with a focus on what has come to be called cultural studies have sprung up at universities in Europe, North America, Asia, and Australia.

The question “what are cultural studies?” cannot be answered readily or unequivocally. Cultural studies are not a run-of-the-mill academic discipline, but rather a research field where the same demarcation difficulties that have wrought havoc in traditional fields are replaced by a productive ambivalence that has played a crucial role ever since the inception of cultural studies in the mid-1960s. Cultural studies is not a field with a universally accepted methodology or theoretical frame of reference, and its critics hold that the interest this kind of cultural analysis has attracted in recent years threatens to undermine the research area. There are also those who assert that cultural studies are no more than a passing fad, and some scholars even prefer not to be unconditionally associated with the designation. Clearly, this is a situation in which we who work in cultural studies must take a stand, and endeavor to narrow the field into to a more structured research area. The point of departure for this article is that the existing tradition in cultural studies provides potential for the development of topical, interdisciplinary research with a critical point of departure, discussing the terms and conditions that apply to human life in contemporary society.

Culture and Identity

Cultural studies is perhaps best viewed in the light of the relationship between culture and identity. This is still one of the key themes of critical, topically oriented research in cultural studies, a field of tension comprising “homelessness,” the fundamental precondition of life in the modern world. The process of modernization, increasingly accentuated today, is eroding the traditional, given patterns of identity, previously rooted in categories such as class, gender, ethnicity, race, and nationality. This erosion has led to a total reshaping of our worldview, one consequence of which is that everyday life in late modernity is uncertain and ambivalent, and people are vulnerable in a novel way. Identity, a sense of belonging, and meaning are no longer taken for granted, no longer aspects of life we simply grow into. Instead, they have become vital dimensions of the world which every human being has to create for him- or herself, so that previously relied on, prefabricated dimensions have to be individually constructed by each one of us. Theories of modernity, so influential in recent years, typically refer to contemporary society as “post-traditional,” that is, as a society in which tradition as a roadmap for life is considered obsolete and the individual is compelled to be a “seeker.” This can be seen most clearly in the young, because they are in the phase of life where a person works most intently on his or her identity. So it is no coincidence that research focused on young people—who are often challenging in their processing of the terms and conditions of life in the modern world—has been a core aspect of socially oriented cultural studies. And it was the research undertaken by the British Birmingham School on youth sub- and countercultures that made

cultural studies a source of inspiration to scholars of the social sciences and the humanities throughout the Western world (Cohen, 1972; Hall & Jefferson, 1977; Hall, Critcher, Jefferson, Clarke, & Roberts, 1978; Hebdige, 1979; Hall, 1997). Since then, the identity-creating dimensions of culture have become increasingly important and so the focus of research in this aspect of cultural studies has shifted from the study of small, significant, delimited subcultures to the impact of popular culture on segments of the population at large, and to the functions of pop culture. One sector of the social sciences that has attracted increasing attention in cultural studies in recent years is the study of everyday life. Scholars in this field investigate problems related to culture in late modernity from the point of view of routines, lifestyles, and patterns. The fact that traditional identities have been destabilized has resulted in a phenomenon sometimes referred to as "tribalization," in which society is seen as a regression to tribal value systems, that is, ethnic, religious, generational, regional, or other groupings defined by their efforts to achieve a policy of identity within the tribe or group. These trends are of crucial interest to cultural studies of the contemporary period. Another aspect of such research takes its inspiration from what is known as critical theory, a research tradition with long experience of integrating aesthetic and ideological analyses into its diagnoses of the contemporary. Its explanatory models in the study of the relations between the individual, culture, and society tend to come from the sociological or psychological disciplines.

"Reading" Culture

Although it is impossible to give a simple definition of cultural studies, the designation in itself implies that cultural studies is concerned with the "study of" or "research into" culture, more specifically contemporary culture. However, this conception is already problematic as the word culture itself is a multidimensional and extensive concept. The fact that cultural studies focus on contemporary culture does not, of course, exclude the historical context or historically based analysis. On the contrary, some of the most interesting recent research has an explicitly historical dimension, even if the main focus is contemporary culture or phenomena with topical implications. The fact remains that the idea of cultural studies was conceived within the parameters of historical research rooted in a general desire to achieve a greater understanding of society as a whole.

The category of "culture" is clearly a problematic contender. A more traditional definition would see it as the epitome of the accomplishments of humanity. In this sense, cultural thoughts and expressions have survived on the basis of their ability to say something profound and perceptive about the human condition. These most sophisticated insights from eras past are recorded in literary, philosophical, scientific, and artistic works. Thus, if we wish to understand the "human being" we must study our cultural heritage. In contrast with this somewhat simplified definition, recent decades of research in the social sciences have begun to produce a much broader understanding of the term culture, relating to how different groups cope with the social and material conditions in which they live. In this sense, culture can also refer to different ways of life (social value systems, lifestyles, institutions, etc.) that develop within a subculture, social class, or nation. This perception of culture, commonly termed the anthropological view, tends to place virtually everything under the umbrella term "culture." If what we consider "highbrow culture" can be equated with the traditional definition of culture given above, then clearly "pop" or "mass" culture corresponds to the anthropological perception. The view of culture that characterizes cultural studies stresses that "culture" is far more than literature, drama, and the arts, but is also reluctant to subscribe to oversimplifications or too broad a definition

to be meaningful. As a result, the last few years have seen a marked interest in discussions that target the symbolic and communicative aspects of lifestyles. Such a perspective can, in certain respects, also bridge the gap between the narrower, more traditional view of culture and the wider, anthropological one.

From this point of view, culture is primarily about production and exchange of meaning between people, and cultural studies become much more concerned with the structures of meaning that sustain the common world we call culture. The question of who we are and with whom we share a sense of community—our identity—depends largely on the ways in which we attribute meaning to the world in which we live. In this way the real essence of culture lies in the demarcation and preservation of differences both within and amongst groups. In order for a culture to develop, the members of a group must share certain fundamental values, feelings, and ideas. They fashion and share the cultural codes that define their world and their own identities similarly for the entire group. This also means that thoughts and feelings actively make up a representational system that defines the place of each person in the world. Without these matrices of meaning—found in an individual's consciousness as well as in his or her social practices—it would be impossible to speak of a sense of belonging, identity, or shared values. But we are not endowed with meaning and identity from above. Rather, meaning is constructed and reconstructed in exchanges between people, and in every community this involves power, prestige, and reputation struggles, in which the meaning-bearing structures of the various groups play a pivotal role. All cultural products and practices are born of the human being's instinctive search for meaning and his or her recourse to symbols, signs, or representations to be able to configure and communicate his or her situation and needs. The principles that allow us to interpret and understand these significances are based on the same rules we use in linguistic practices. The fact that cultures are synthetic, meaning-bearing structures makes them similar, in some respects, to a text, which can be "read."

When French semiotician Roland Barthes (1972, 1975), whose work is key to the tradition of cultural studies, expressed a keen interest in soccer, it was immediately clear that what attracted him was not which team was at the top of the league. For Barthes, the key questions were what it is that drives people to become soccer fans in the first place, the role of soccer in shaping an identity, and how it confers meaning to people's lives—in other words, how should we read soccer culture? How can a soccer match generate such powerful reactions in an entire country or amongst the supporters of a particular club? It is precisely such questions that are central to cultural studies. Another founding father of the discipline is French anthropologist Claude Lévi-Strauss (1966), who studied the role of ritual, myth, and folklore amongst "primitive" peoples in South America. Lévi-Strauss was not primarily interested in how these traditions came in to being or how they were used. Instead, he attached great importance to what they can tell us about the kind of lives these people lead. He was interested in analyzing meaning, not by plotting and documenting the origins of their myths and rituals, but by understanding the codes and systems of signification, the rules by which any one ritual or folktale produces meaning. Both of these approaches seek to tease out and grasp what lies below the surface of these everyday forms of performance. More recently, the work of French philosopher Michel Foucault (1988) has become important to cultural studies. His overriding interest is more about cognizance and knowledge than meaning in itself, and he thinks in terms of discourse rather than language. It is discourse that determines what we can say, that controls the way we speak and the way we shape knowledge about something. Discourse also dictates how knowledge and learning are structured in a social context and, for this reason, it is central to the perception of power and the exercise of power in a society.

Cultural Studies: An Open and Critical Project

Cultural studies are about critical cultural research focusing on contemporary society. Cultural studies should be seen as a discursive structure, a research project with a sense of direction driven by particular areas of interest. This kind of cultural research affords scholars from differing disciplines and with varying views of scholarship the space to pursue an ongoing dialogue about methods of research and theoretical points of view. As such, this cultural research must, by necessity, be an "open project," with an inherent aversion to the privileging of any one metadiscourse or methodology. However, the current situation, in which the internationally accepted term cultural studies is synonymous with research defined solely by the interests of each researcher in a particular field, is problematic. British sociologist Stuart Hall (1992), a prominent thinker in his field, maintains that cultural studies "can't just be any old thing which chooses to march under a particular banner." Certain criteria must be established to arrive at a definition of cultural studies. This article is inclined to concur with Hall in his assertion that it must remain a characteristic feature that cultural studies refuse to be defined in a traditional, academic way, as using a given neutral standpoint to study, for example, the lifestyle or the aesthetics of a group. One defining aspect of cultural studies is undoubtedly the relationship with society beyond academia. According to Hall, the scholar has to define his or her role as a critically thinking intellectual whose research reflects his or her close relationship with society and its expressions. The seeds of the kind of research into contemporary culture that is "cultural studies" were taken from this vision of scientific scholarship. One model that bears relation to this idea, of which Hall is an advocate, was inspired by Italian philosopher Antonio Gramsci (1988), who argues that we need "organic intellectuals," thinkers who do not simply allow themselves to be swayed by utilitarian ideologies and power structures. Of course, this does not imply that their research abandons its "scientific" stance, nor does it mean that the researcher will carry the torch for a political ideology or the interests of a specific stratum of society. For research to be a truly critical project, it must also be critical of itself and call its own work and motivating factors into question.

Against this background, we can see that the point of departure in a discussion that seeks to understand what this type of research is and what it should be must stem from a necessary tension between the refusal to unequivocally and definitively define the field of study and the need to determine, develop, and highlight the standpoints that correspond to the inherent critical intentions and opportunities of the genre. One way of identifying these standpoints is to step back and engage in a closer analysis of the historical conditions that originally brought critical, contemporary cultural research into being.

Cultural Studies and Popular Culture

Cultural studies are often associated with youth and popular culture. To get a better idea of the line of thought within a more concrete cultural studies approach this section offers a little insight into the study of youth subcultures and popular culture. Research in the field of popular culture can be likened to a seismograph, a sensitive instrument that detects movements under the surface of society, of which expressive youth cultures are arguably the most striking example. In youth culture social conflicts, contradictions, and trends are expressed symbolically. Young people's production and reception of culture are related in a complex and transitional way to their social conditions. The task of the researcher is to "read" contemporary tendencies in society through the cultural expressions or codes that youth create and employ.

One reason why the study of youth culture has been one of the most exciting fields of research in the social sciences and the humanities during the last decade is its focus on

the unsecured or unstable identity in late modern society. This theme stretches far beyond youth, although, for understandable reasons, questions of identity are especially acute during that period of life. It is not difficult to trace how different phases of the postwar modernization process have been reflected in youth culture. In simple terms, youth cultures of the 1950s and 1960s mainly thematized identity in relation to class. Teddy Boys in the UK as well as their Swedish equivalent, Raggare, the Bikers, and the Mod culture can be seen and understood against the background of the changed patterns in class cultures at a time when UK and Swedish societies, as in most other parts of Western Europe, sloughed off its old skin and everyday life took great strides into modernity. Youth cultures of the late 1960s, 1970s, and 1980s demonstrated androgynous features. Music styles, glitter rock, punk, and hard rock, and artists like David Bowie, Annie Lennox, and Michael Jackson focused in a new way on gender. In modern society it is no longer obvious or given how a person must live or look as a man or woman, for youth culture has offered an internal as well as an external arena for experimentation.

Of course, the youth cultures of the late 1980s and early 1990s still express the themes of class and gender, but it also seems that, with the emergence of reggae, hip-hop, and rap, there is now a focus on ethnicity and roots. In the USA, the home of rap music, one branch of hip-hop culture has proclaimed that rap is a black expression and that only blacks have the "right" to use it. Against this "Afrocentrism" other groups of black, white, Hispanic, and Asian immigrants in the USA and Britain assert that rap cannot be reserved solely for Afro-Americans merely because it has its origins in the black ghetto—to quote the rap artist Kid Frost, "rap is not a black art form, it's an urban art form." This "ghetto-centrism" is currently a growing element in rap music. Despite its strong Afro-American roots, rap music, through its creative collage and sampling technique, can be seen as a multicultural, postmodern aesthetic expression. Like all Afro-American-based music, rap is characterized by its "call-and-response" patterns, which mean it is open to the reactions of the receiver. This quality has enabled a fusion of the musical features of different cultures; television commercial jingles, rock, Egyptian belly dance, and African drums all meet in rap. Together with its textual themes, this has made rap a genre that expresses in a multitude of ways the identity work that is required by modern, multicultural society. The "Hip-Hop Nation" has a culture with black roots, but its inhabitants are a multicolored ethnic mixture.

Culture

KAREN RISAGER

Introduction

References to “culture” have become more and more prominent in applied linguistics, especially since the 1980s. The term has typically been used in order to highlight the (supposed) intimate relationship between language and culture in a number of disciplines such as intercultural pragmatics, intercultural communication, and intercultural learning as part of foreign and second language learning.

The chief aim of this entry is to show some of the complexity and heterogeneity of the concept of culture and thus to contribute to a critical discussion of the sometimes rather simplistic identification of “language” and “culture” in applied linguistics. For a more thorough analysis of this issue, see Risager (2006), from which parts of this entry are drawn.

The following sections outline the development of the concept of culture in European history and in cultural anthropology, including its relation to the interdisciplinary field of cultural studies. Cultural anthropology is particularly relevant to applied linguistics because it is the academic discipline that has taken the keenest interest in the concept of culture throughout its history, during which it has also taken account of the linguistic dimension of culture. Both American cultural anthropology and French structuralist cultural anthropology have drawn inspiration from various forms of linguistics. American linguistic anthropology has also included the Whorfian discussion concerning the relationship between language/culture and thought, a discussion preceded by a similar one in the German-speaking parts of Europe, opened by W. von Humboldt in the 1830s.

Originally a European Concept, Different From for Example East-Asian Concepts

The word “culture” first appears as the classical Latin *cultura*, which had to do with the cultivation of land and care of flora and fauna. The stem *col-* (infinitive *colere*) had a very broad area of meaning, covering such words as *to settle*, *to inhabit* (e.g., *colony*, *colonization*), *to cultivate*, *to care for*, *to provide*, *to praise*, *to celebrate* (cf. the other Latin nominalization *cultus* and the word *cult*). After its history in Classical and medieval Latin it spread to most European national languages as an academic term that did not enter everyday language until the course of the 19th century—initially in Germany (Márkus, 1993). The word has been subject to a number of semantic transformations engendered by the general cultural and social history of Europe. En route, the concept has undergone differing semantic changes in the various linguistic communities (especially England/France on the one hand and the German-speaking area on the other). These developments have to do with the meaning of the concept of culture in relation to the neighboring concepts of ‘civilization’ (in an English, French, and German version) and the German concept of *Bildung* (Elias, 1939/1969).

This development can be compared to that of near-equivalent East-Asian concepts: the Chinese *wen hua* (culture or civilization, really, to change oneself through written characters,

education) and *wen ming* (civilization or culture, civilized) and the Japanese (etymologically the same and written with the same signs) *bun-ka* (culture as opposed to nature) and *bun-me* (civilization). Whereas the East-Asian concepts have a totally different history related to the importance of literacy, the European concept of culture constitutes an old but still living metaphor referring to the act of cultivation, which means that the European concept sometimes still has connotations of the earth, of roots, origins, growth, and so on (Risager, 2006).

Concepts of Culture in Europe: Individual, Collective, and Aesthetic

Whereas “culture” originally only had the literal meaning of cultivating the land (as explained above), its meaning was expanded during Roman times into a metaphor referring to the cultivation of the individual soul or mind. We know this was the case at least from the time of Cicero, who used the metaphorical expression *cultura animi* (i.e., cultivation of the soul or mind), which had to do with the individual’s mental cultivation, either via self-development or, later, from the time of Augustine (ca. AD 400), via God’s cultivation of the soul. For many centuries *cultura animi* (or, from the 16th century, *cultura* without a logical object) designated a process of mental cultivation, a pedagogical process. Not until the 17th century could the concept also designate the result of this process, in other words the mental (intellectual, spiritual, aesthetic) level the person involved had attained. One then began to speak of “the cultivated person.”

From the end of the 17th century, a collective concept of culture developed alongside the individual one. The collective concept of culture has to be divided into a hierarchical and a non-hierarchical variant. The hierarchical variant is the earlier, and it deals either with the societal conditions for the individual process of cultivation or with what “cultivated people” have in common. The hierarchical element is that one perceives certain groups in society, or certain peoples, as being cultivated (the Europeans) and others as being uncultivated (i.e., “savage”). This hierarchical concept of culture was challenged in the 1770s and 1780s by J. G. von Herder (1782–91/1952), who historicized and “dehierarchized” the concept of culture by emphasizing that all the peoples of the world participate in a gradual, historical process of cultivation, and that every people possesses culture.

In the course of the 19th century, a number of special spheres crystallized in connection with modern development, including “art” with its subsections: literature, the visual arts, music, and so on. These became a reference for the aesthetic concept of culture which developed during the same period, alongside other concepts of culture, and which adopted a narrowing, individual, and hierarchizing direction that focused in particular on artistic products as supreme achievements of symbolic–aesthetic creativeness. In American discourse, the aesthetic concept of culture is often associated with the term “big C.”

Concepts of Culture in Cultural Anthropology Until the 1970s

The period between the early 1900s and the early 1970s was productive in terms of new academic perspectives on the study of culture.

All-Embracing, Functional Concepts of Culture (First Half of the 20th Century)

The European—especially German—concept of culture in the 19th century was taken across the Atlantic by the German-born F. Boas (educated in physics and geography) in the years around 1900 in connection with his involvement in ethnographic studies of American Indian

cultures and languages. Boas developed a functional concept of culture that emphasises the integrated character of every culture taken as a whole, comprising both material and immaterial life. He was highly critical of the evolutionism of the 19th century and its innate ethnocentrism and racism, and he and his followers gave the concept of culture the culture-relativist character it has had ever since in most American anthropology. Boas was the man who organized anthropology in the USA as a cohesive and independent discipline that students could study as part of their education. It was his vision of anthropology that came to characterize anthropology in the interwar years, and in that vision the concepts of both culture and language enjoyed a prominent position. Among his followers are for example R. Benedict, E. Sapir, and B. L. Whorf, and the tradition can be said to be rounded up by A. L. Kroeber and C. Kluckhohn, who offered a synthesis of a large number of different definitions of culture existing at that time (Kroeber & Kluckhohn, 1952).

Meaning-Oriented Concepts of Culture (From the 1950s)

In the 1950s and 1960s, dissatisfaction gradually grew against this all-embracing, and some would say amorphous, concept of culture, and people tried to limit and clarify it in various ways. One suggestion was to consider cultures as ideational systems (systems of meanings) that had a more or less independent status in the societal whole. In this approach the concept of culture came to have similarities with the concept of language or text. Among the anthropologists who chose to focus on the meaning-oriented dimension one can distinguish, up to the 1970s, between three main approaches: a cognitive, a structuralist, and an interpretive approach. The three approaches have in their separate ways transferred theories and methods to do with language and texts to the realm of cultural analysis.

The cognitive approach was mainly represented by W. Goodenough in the first phase of cognitive anthropology, which was inspired by the American structural linguistics of the 1950s: taxonomic linguistics, componential analysis, and so on (Goodenough, 1957/1964). The tendency is also called *ethnosemantics*, *ethnoscience*, or *new ethnography*. Goodenough saw culture as being analogous to language, and he therefore transferred linguistic methods to an analysis of culture. This practice resulted in the use of the concept of "cultural grammar" for the cultural rules and systems that were uncovered. Apart from the method being inspired by contemporary American linguistics, it was also prompted by precisely the rejection by this type of linguistics of the study of semantics. The entire semantic field of research was thus open to anthropology. Cognitive anthropology, which is still a flourishing field, mainly understands culture as knowledge: The locus of culture is in human consciousness. In terms of method, a cognitive ethnographical analysis of culture has to do with studying the content in and the structures of this knowledge, for example through an analysis of the conceptual system of the informants within a particular area: kinship systems, plant life (*ethnobotany*), diseases and their treatment (*ethnomedicine*), and so on. This analysis can, for example, comprise componential analysis of the semantic elements that are part of the system. Keesing (1974, 1994) is one example of later representatives of this tradition.

The structuralist approach to the study of culture from the 1950s is evident in the work of French anthropologist C. Lévi-Strauss, who moved to New York during World War II. He was inspired by Boas, but also by linguistic structuralism and cybernetics. Acquainted with the Prague School's phonemic theory via R. Jakobson, he was inspired to attempt to transfer the idea of unconscious thought structures to the broader area of culture, and he formulated a theory of how social phenomena could be analyzed as an expression of cumulative processes of consciousness shared by all humanity. A knowledge of cybernetics prompted him to emphasize the binary logic of the processes of consciousness. In terms of method, a structuralist analysis of culture thus typically deals with arriving at an understanding of symbolic pairs of opposites in culture, such as nature/culture, female/male,

cold/hot, human/animal, bad/good, for instance via a study of kinship systems or myths (Lévi-Strauss, 1958).

An interpretive approach to cultural anthropology was driven in particular by the American anthropologist C. Geertz from the 1960s. Geertz's (1973) thoughts have had a great impact both within anthropology itself and in the cultural and social sciences in general. Geertz is at odds with cognitive anthropology in that he claims that the locus of culture lies in social action. Culture, then, is to be found among the members of a society and it is public. Social action is conceived of as a text ("an acted document") that is a bearer of complex networks of meaning. The ethnographer has to interpret this culture-as-text by making a "thick description" of the semantic structures it conceals. While cognitive linguistics, especially in the 1960s and 1970s, had a strong affinity with American linguistics, interpretive anthropology has had relations with hermeneutics and thereby with literary interpretation. So it is also a view of culture that is not blind to the aesthetic dimension of cultural practice.

Concepts of Culture in Anthropology From the 1980s

In the 1970s, anthropology, like many other cultural and social sciences, was to a certain extent influenced by Marxist trends. The concept of culture was typically understood as ideology, and studies of culture were often synonymous with studies of ideological criticism. But from the 1980s, the concept of culture became salient and, in the practice-oriented form, more or less influenced by contemporary postmodern thought (Keesing, 1994).

Practice-Oriented Concepts of Culture

The orientation toward practice was accompanied by a critique of system thinking in most culture research until then: Goodenough, Keesing, Lévi-Strauss, and Geertz all described culture (in their publications prior to the 1980s) as a system or a structure (more or less varied or distributed). From the 1980s there was increasing skepticism toward, or even a rejection of, the idea of culture as a cohesive system. This antisystem tendency meant, among other things, that cultural theory stopped using analogies to linguistics in its system-oriented forms (Street, 1993), and drew more for inspiration on practice-oriented linguistic philosophy, for instance the late Wittgenstein.

Those perspectives aligned with social constructionism prefer to criticize what they refer to as the essentialist understanding of culture, in other words the conception of culture as "something" that has a particular essence and that can be used as an explanatory factor regarding people's actions and attitudes.

Since the emphasis on the conception of culture lies in the dimension of practice, this conception of culture is in the main an extension of the interpretive branch. Geertz is a precursor of the practice-oriented concept of culture, and he is sometimes described as "prepostmodern." For Geertz, the task of the ethnographer is to unearth the already existing system of symbols via a thick description of symbol-saturated practice. For advocates of the practice-oriented concept of culture, the symbols are created and recreated in the negotiation of meaning between people in social interaction. Particular emphasis is placed on the meaning-creating individual, with some people also talking of a subject-oriented or subjectivist concept of culture. The stress, however, is not on the single individual but on individuals in interaction, that is, on intersubjective processes. Emphasis is placed on the procedural, social, and conflictual aspects of the ascription of meaning in context.

Running parallel with the practice-oriented conception of culture is also a cognitive anthropology that is interested in the inner locus of culture, theorized as individuals' cultural models of the world (Shore, 1996). But parts of this tendency too are moving toward a conception of knowledge of the world as being socially constructed in interaction and discourse. Among the scholars who combine a cognitive and a practice-oriented approach

is Agar (1980, 1994).

Anthropology and Cultural Studies

The interdisciplinary cultural studies movement has exerted a certain influence on parts of anthropology since the 1980s (Turner, 1993). This has led to a shift of anthropological interest toward such subjects as culture and ethnicity in the modern metropolis, subcultures and cultural dominance, multiculturalism and identity politics. The cultural studies movement intertwined in the 1980s with the postmodern tendency, which generally emphasizes capturing differences, heterogeneity, otherness, multiplicity, particularity, complexity, and hybridity (Hall, 1992, 1996).
